<b>PREFACE</b> . . . . .	<b>9</b>
<b>PART I TREATY ESTABLISHING THE ENERGY COMMUNITY</b> . . . . .	<b>11</b>
The Treaty . . . . .	14
Annexes . . . . .	42
Protocol on the Accession of Moldova to the Energy Community Treaty . . . . .	46
Protocol on the Accession of Ukraine to the Energy Community Treaty . . . . .	49
Protocol on the Accession of Georgia to the Energy Community Treaty . . . . .	52
<b>PART II ACQUIS COMMUNAUTAIRE</b> . . . . .	<b>59</b>
<b>ELECTRICITY</b> . . . . .	<b>59</b>
Directive 2009/72/EC of 13 July 2009 concerning common rules for the internal market in electricity . . . . .	61
Regulation (EC) 714/2009 of 13 July 2009 on conditions for access to the network for cross-border exchanges in electricity . . . . .	117
Regulation (EU) 838/2010 of 23 September 2010 on laying down guidelines relating to the inter-transmission system operator compensation mechanism and a common regulatory approach to transmission charging . . . . .	143
Regulation (EU) 543/2013 of 14 June 2013 on submission and publication of data in electricity markets . . . . .	153
Regulation (EU) 2016/1388 of 17 August 2016 establishing a network code on demand connection . . . . .	173
Regulation (EU) 2016/631 of 14 April 2016 establishing a network code on requirements for grid connection of generators . . . . .	227
Regulation (EU) 2016/1447 of 26 August 2016 establishing a network code on requirements for grid connection of high voltage direct current systems and direct current-connected power park modules . . . . .	309
Regulation (EU) 1227/2011 of 25 October 2011 on wholesale energy market integrity and transparency <sup>1</sup> . . . . .	383
Rules of 21 June 2012 governing the adoption of guidelines and network codes in the Energy Community <sup>2</sup> . . . . .	403
<b>GAS</b> . . . . .	<b>407</b>
Directive 2009/73/EC of 13 July 2009 concerning common rules for the internal market in natural gas . . . . .	409
Regulation (EC) 715/2009 of 13 July 2009 on conditions for access to the natural gas transmission networks . . . . .	469

<sup>1</sup> Applicable for both electricity and gas.

<sup>2</sup> *ibid.*

Regulation (EU) 703/2015 of 30 April 2015 establishing a network code on interoperability and data exchange rules . . . . .	501
Regulation (EU) 2017/459 of 16 March 2017 establishing a network code on capacity allocation mechanisms in gas transmission systems and repealing Regulation (EU) 984/2013 . . .	521
Regulation (EU) 2017/460 of 16 March 2017 establishing a network code on harmonized transmission tariff structures for gas . . . . .	557
Regulation (EU) 312/2014 of 26 March 2014 establishing a network code on gas balancing of transmission networks . . . . .	593
<b>SECURITY OF SUPPLY . . . . .</b>	<b>627</b>
Directive 2005/89/EC of 18 January 2006 concerning measures to safeguard security of electricity supply and infrastructure investment . . . . .	629
Directive 2004/67/EC of 26 April 2004 concerning measures to safeguard security of natural gas supply . . . . .	639
<b>OIL . . . . .</b>	<b>649</b>
Directive 2009/119/EC of 14 September 2009 imposing an obligation on Member States to maintain minimum stocks of crude oil and/or petroleum products . . . . .	651
Recommendation 2018/02/MC-EnC on preparing for the implementation of Directive 98/70/EC relating to the quality of petrol and diesel fuels and amending Council Directive 93/12/EEC . . . . .	675
<b>INFRASTRUCTURE . . . . .</b>	<b>679</b>
Regulation (EU) 347/2013 of 17 April 2013 on guidelines for trans-European energy infrastructure . . . . .	681
<b>ENVIRONMENT . . . . .</b>	<b>725</b>
Directive 2011/92/EU of 13 December 2011 on the assessment of the effects of certain public and private projects on the environment, as amended by Directive 2014/52/EU . . . . .	727
Directive (EU) 2016/802 of 11 May 2016 relating to a reduction in the sulphur content of certain liquid fuels . . . . .	755
Directive 2001/80/EC of 23 October 2001 on the limitation of emissions of certain pollutants into the air from large combustion plants. . . . .	775
Directive 2010/75/EU of 24 November 2010 on industrial emissions (integrated pollution prevention and control) . . . . .	803
Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds . . . . .	829

Directive 2004/35/EC of 21 April 2004 on environmental liability with regard to the prevention and remedying of environmental damage, as amended by Directive 2006/21/EC, Directive 2003/31/EC and Directive 2013/30/EU . . . . .	841
Directive 2001/42/EC of 27 June 2001 on the assessment of the effects of certain plans and programmes on the environment . . . . .	865
<b>RENEWABLE ENERGY . . . . .</b>	<b>877</b>
Directive 2009/28/EC of 23 April 2009 on the promotion of the use of energy from renewable sources . . . . .	879
<b>ENERGY EFFICIENCY . . . . .</b>	<b>945</b>
Directive 2012/27/EU of 25 October 2012 on energy efficiency . . . . .	947
Directive 2010/31/EU of 19 May 2010 on the energy performance of buildings . . . . .	1013
Regulation (EU) 2017/1369 of 4 July 2017 setting a framework for energy labelling and repealing Directive 2010/30/EU on the indication by labelling and standard product information of the consumption of energy and other resources by energy-related products . . . . .	1041
Delegated Regulation (EU) 2017/254 of 30 November 2016 amending Delegated Regulations (EU) 1059/2010, (EU) 1060/2010, (EU) 1061/2010, (EU) 1062/2010, (EU) 626/2011, (EU) 392/2012, (EU) 874/2012, (EU) 665/2013, (EU) 811/2013, (EU) 812/2013, (EU) 65/2014, (EU) 1254/2014, (EU) 2015/1094, (EU) 2015/1186 and (EU) 2015/1187 with regard to the use of tolerances in verification procedures . . . . .	1063
Delegated Regulation (EU) 518/2014 of 5 March 2014 amending Delegated Regulations (EU) 1059/2010, (EU) 1060/2010, (EU) 1061/2010, (EU) 1062/2010, (EU) 626/2011, (EU) 392/2012, (EU) 874/2012, (EU) 665/2013, (EU) 811/2013 and (EU) 812/2013 with regard to labelling of energy-related products on the internet . . . . .	1097
Delegated Regulation (EU) 2015/1094 of 5 May 2015 supplementing Directive 2010/30/EU with regard to the energy labelling of professional refrigerated storage cabinets . . . . .	1123
Delegated Regulation (EU) 2015/1186 of 24 April 2015 supplementing Directive 2010/30/EU with regard to the energy labelling of local space heaters . . . . .	1145
Delegated Regulation (EU) 2015/1187 of 27 April 2015 supplementing Directive 2010/30/EU with regard to energy labelling of solid fuel boilers and packages of a solid fuel boiler, supplementary heaters, temperature controls and solar devices . . . . .	1173
Delegated Regulation (EU) 1254/2014 of 11 July 2014 supplementing Directive 2010/30/EU with regard to energy labelling of residential ventilation units . . . . .	1209
Delegated Regulation (EU) 65/2014 of 1 October 2013 supplementing Directive 2010/30/EU with regard to the energy labelling of domestic ovens and range hoods . . . . .	1233

Delegated Regulation (EU) 812/2013 of 18 February 2013 supplementing Directive 2010/30/EU with regard to the energy labelling of water heaters, hot water storage tanks and packages of water heater and solar device . . . . .	1275
Delegated Regulation (EU) 811/2013 of 18 February 2013 supplementing Directive 2010/30/EU with regard to the energy labelling of space heaters, combination heaters, packages of space heater, temperature control and solar device and packages of combination heater, temperature control and solar device . . . . .	1331
Delegated Regulation (EU) 874/2012 of 12 July 2012 supplementing Directive 2010/30/EU with regard to energy labelling of electrical lamps and luminaires . . . . .	1425
Delegated Regulation (EU) 392/2012 of 1 March 2012 supplementing Directive 2010/30/EU with regard to energy labelling of household tumble driers . . . . .	1455
Delegated Regulation (EU) 626/2011 of 4 May 2011 supplementing Directive 2010/30/EU with regard to energy labelling of air conditioners . . . . .	1487
Delegated Regulation (EU) 1062/2010 of 28 September 2010 supplementing Directive 2010/30/EU with regard to energy labelling of televisions . . . . .	1567
Delegated Regulation (EU) 1061/2010 of 28 September 2010 supplementing Directive 2010/30/EU with regard to energy labelling of household washing machines . . . . .	1591
Delegated Regulation (EU) 1060/2010 of 28 September 2010 supplementing Directive 2010/30/EU with regard to energy labelling of household refrigerating appliances . . . . .	1615
Delegated Regulation (EU) 1059/2010 of 28 September 2010 supplementing Directive 2010/30/EU with regard to energy labelling of household dishwashers . . . . .	1651
Directive 96/60/EC of 19 September 1996 implementing Directive 92/75/EEC with regard to energy labelling of household combined washer-driers . . . . .	1673
<b>STATISTICS . . . . .</b>	<b>1685</b>
Regulation (EC) 1099/2008 of 22 October 2008 on energy statistics . . . . .	1687
Regulation (EU) 2016/1952 of 26 October 2016 on European statistics on natural gas and electricity prices . . . . .	1757
Implementing Regulation (EU) 2019/803 of 17 May 2019 concerning the technical requirements regarding the content of quality reports on European statistics on natural gas and electricity prices pursuant to Regulation (EU) 2016/1952 . . . . .	1771
<b>CLIMATE . . . . .</b>	<b>1777</b>
Recommendation on preparing for the development of integrated national energy and climate plans by the Contracting Parties of the Energy Community . . . . .	1779

Recommendation on preparing for the implementation of Regulation (EU) 525/2013 on a mechanism for monitoring and reporting greenhouse gas emissions . . . . .	1785
General Policy Guidelines on the 2030 targets for the Contracting Parties of the Energy Community <sup>3</sup> . . . . .	1789
<b>CYBERSECURITY</b> . . . . .	<b>1793</b>
Procedural Act 2018/02/MC-EnC of 29 November 2018 on the establishment of an Energy Community Coordination Group for Cybersecurity and Critical Infrastructure . . . . .	1795
<b>PART III MEASURES AND PROCEDURAL ACTS BY ENERGY COMMUNITY INSTITUTIONS</b> . . . .	<b>1807</b>
Rules of Procedure of 16 October 2015 of the Ministerial Council of the Energy Community .	1809
Rules of Procedure of 16 October 2015 of the Permanent High Level Group of the Energy Community. . . . .	1817
Rules of Procedure of 24 April 2019 of the Energy Community Regulatory Board . . . . .	1825
Rules of Procedure of 16 October 2015 on dispute settlement under the Treaty. . . . .	1837
Rules of 16 October 2015 on strengthening the role of civil society . . . . .	1855
Rules of 16 October 2015 on establishment of Energy Community parliamentary plenum meetings . . . . .	1859
Rules of 11 December 2008 on establishment of a security of supply coordination group . . . .	1863
Rules of 29 November 2018 on the establishment of a coordination group of the Energy Community distribution system operators for electricity. . . . .	1867
Rules of 3 December 2018 on the establishment of a Dispute Resolution and Negotiation Centre . . . . .	1875
Rules of Procedure of 29 November 2018 of Energy Community Parliamentary Plenum . . . .	1889

---

<sup>3</sup> The General Policy Guidelines represent the political consensus reached in the 16th Ministerial Council on the 2030 targets for the Contracting Parties of the Energy Community in November 2018.

## PREFACE

When the Treaty establishing the Energy Community entered into force in 2006, it explicitly referred to 11 legal acts that the Contracting Parties were to transpose and implement. Just as the EU law is continuously evolving, so is also the Energy Community legal framework subject to ongoing integration and revision. Today the Energy Community body of law amounts to 99 Decisions and 43 Procedural Acts adopted by the Ministerial Council and the Permanent High Level Group, facilitating the transposition and implementation of 15 Directives, 35 Regulations and three Recommendations.

In line with its increased competences arising from the Third Energy Package, the Permanent High Level Group adopted the first Energy Community network code in 2013. Defined as a set of technical rules, a network code addresses the major barriers impeding the cross-border flow of electricity and gas, transforming a mere patchwork of national energy markets into a single European energy market. Today all five gas and three out of the eight electricity codes have been incorporated into the Energy Community acquis. This is reflected in Part I / Treaty / Annex I, where the list of acts included in the “acquis communautaire of energy” has been expanded from seven to total of 18 acts.

In Part II / energy efficiency, the edition displays the new labelling Regulation (EU) 2017/1369, together with 18 delegated regulations for the most energy-consuming home and industrial appliance product groups. Whilst the Regulation provides for the labelling, standard product information regarding energy efficiency and the consumption of energy, a delegated regulation lays down the rules for a specific product group.

With the EU's Green Deal taking more and more concrete form, the next wave of new acquis is just around the corner. Instead of waiting for binding Clean Energy Package rules, the Ministerial Council took the first steps towards integrating climate issues in the context of the Energy Community already in 2016. Also, these rules and commitments, together with those on cybersecurity, are presented for the first time in Part II of this 4.2. edition.

As with the previous editions, Part III displays the latest versions of the Rules of Procedure governing the Energy Community institutional bodies. Rules on establishing the distribution system operators group and the Secretariat's Dispute Resolution and Negotiation Centre constitute the new element of the section.

In putting the applicable Energy Community legal framework under one cover, this 4.2 edition provides a working tool for all stakeholders involved in the process of consolidating and developing the Energy Community. In editorial terms, it is important to note that the legislation compiled in this edition consists of consolidations done by the editors for the sake of convenience only. In any circumstance, the versions adopted by the legislature in the European Union and the Energy Community and published in the Official Journal or the Energy Community website respectively, shall prevail.

Vienna, April 2021

## TREATY ESTABLISHING THE ENERGY COMMUNITY

The Parties, being:

The European Community on the one hand,

And

The following Contracting Parties on the other hand:

- The Republic of Albania, the Republic of Bulgaria, Bosnia and Herzegovina, the Republic of Croatia, the former Yugoslav Republic of Macedonia, the Republic of Montenegro, Romania, the Republic of Serbia (hereafter referred to as the Adhering Parties),

and

- The United Nations Interim Administration Mission in Kosovo pursuant to the United Nations Security Council Resolution 1244,

Consolidating on the Athens Process and the 2002 and 2003 Athens Memoranda of Understanding,

Noting that the Republic of Bulgaria, Romania and the Republic of Croatia are Candidate Countries for accession to the European Union, and that the former Yugoslav Republic of Macedonia has also applied for membership,

Noting that the European Council in Copenhagen in December 2002 confirmed the European perspective of the Republic of Albania, Bosnia and Herzegovina, and Serbia and Montenegro, as potential candidates for accession of the European Union, and underlined the determination to support their efforts to move closer to the European Union,

Recalling that the European Council in Thessaloniki in June 2003 endorsed “The Thessaloniki Agenda for the Western Balkans: moving towards European integration”, which aims to further strengthen the privileged relations between the European Union and the Western Balkans and in which the European Union encouraged the countries of the region to adopt a legally binding South-East Europe energy market agreement,

Recalling the Euro-Mediterranean Partnership Process and the European Neighbourhood Policy,

Recalling the contribution of the Stability Pact for South East Europe that has as its core the need to strengthen co-operation amongst the states and nations of South East Europe and to foster the conditions for peace, stability and economic growth,

Resolved to establish among the Parties an integrated market in natural gas and electricity, based on common interest and solidarity,

Considering that this integrated market may involve at a later stage other energy products and carriers, such as liquefied natural gas, petrol, hydrogen, or other essential network infrastructures,

Determined to create a stable regulatory and market framework capable of attracting investment in gas networks, power generation and transmission networks, so that all Parties have access to the stable and continuous gas and electricity supply that is essential for economic development and social stability,

Determined to create a single regulatory space for trade in gas and electricity that is necessary to match the geographic extent of the concerned product markets,

Recognising that the territories of the Republic of Austria, of the Hellenic Republic, of the Republic of Hungary, of the Italian Republic, and of the Republic of Slovenia are naturally integrated or directly affected by the functioning of the gas and electricity markets of the Contracting Parties,

Determined to promote high levels of gas and electricity provision to all citizens based on public service obligations, and to achieve economic and social progress and a high level of employment as well as a balanced and sustainable development through the creation of an area without internal frontiers for gas and electricity,

Desiring to enhance the security of supply of the single regulatory space by providing the stable regulatory framework necessary for the region in which connections to Caspian, North African and Middle East gas reserves can be developed and indigenous reserves of natural gas, coal and hydro-power can be exploited,

Committed to improving the environmental situation in relation to gas and electricity, related energy efficiency and renewable energy sources,

Determined to develop gas and electricity market competition on a broader scale and exploit economies of scale,

Considering that, to achieve these aims, a broad ranging and integrated market regulatory structure needs to be put in place supported by strong institutions and effective supervision, and with the adequate involvement of the private sector,

Considering that in order to reduce stress on the state level gas and electricity systems and contribute to resolving local gas and electricity shortages, specific rules should be put in place to facilitate gas and electricity trade; and that such rules are needed to create a single regulatory space for the geographic extent of the concerned product markets,

Have decided to create an Energy Community.

## TITLE I – PRINCIPLES

### Article 1

1. By this Treaty, the Parties establish among themselves an Energy Community.
2. Member States of the European Community may become Participants in the Energy Community pursuant to Article 95 of this Treaty.

### Article 2

1. The task of the Energy Community shall be to organise the relations between the Parties and create a legal and economic framework in relation to Network Energy, as defined in paragraph 2, in order to:

- (a) create a stable regulatory and market framework capable of attracting investment in gas networks, power generation, and transmission and distribution networks, so that all Parties have access to the stable and continuous energy supply that is essential for economic development and social stability,
- (b) create a single regulatory space for trade in Network Energy that is necessary to match the geographic extent of the concerned product markets,
- (c) enhance the security of supply of the single regulatory space by providing a stable investment climate in which connections to Caspian, North African and Middle East gas reserves can be developed, and indigenous sources of energy such as natural gas, coal and hydropower can be exploited,
- (d) improve the environmental situation in relation to Network Energy and related energy efficiency, foster the use of renewable energy, and set out the conditions for energy trade in the single regulatory space,
- (e) develop Network Energy market competition on a broader geographic scale and exploit economies of scale.

2. "Network Energy" shall include the electricity and gas sectors falling within the scope of the European Community Directives 2003/54/EC and 2003/55/EC.<sup>1</sup>

### Article 3

For the purposes of Article 2, the activities of the Energy Community shall include:

- (a) the implementation by the Contracting Parties of the *acquis communautaire* on energy, environment, competition and renewables, as described in Title II below, adapted to both the institutional framework of the Energy Community and the specific situation of each of the Contracting Parties (hereinafter referred to as "the extension of the *acquis communautaire*"), as further described in Title II;
- (b) the setting up of a specific regulatory framework permitting the efficient operation of Network

<sup>1</sup> According to Article 1 of Decision 2008/03/MC-EnC of 1 December 2008 concerning the implementation to the oil sector of certain provisions of the Treaty and the creation of an Energy Community Oil Forum, "1. The Treaty is extended to oil under the conditions set by this Article.

2. 'Network Energy' as mentioned in Article 2 paragraph 2 of the Treaty shall be understood as to include the oil sector, i.e. supply, trade, processing and transmission of crude oil and petroleum products falling within the scope of the Directive 2006/67/EC and the related pipelines, storage, refineries and import/export facilities <...>

4. Paragraphs 1 and 2 of this Article do not apply to Articles 21 to 23 and to Articles 43 to 46 of the Treaty."

Energy markets across the territories of the Contracting Parties and part of the territory of the European Community, and including the creation of a single mechanism for the cross-border transmission and/or transportation of Network Energy, and the supervision of unilateral safeguard measures (hereinafter referred to as “the mechanism for operation of Network Energy markets”), as further described in Title III;

(c) the creation for the Parties of a market in Network Energy without internal frontiers, including the coordination of mutual assistance in case of serious disturbance to the energy networks or external disruptions, and which may include the achievement of a common external energy trade policy (hereinafter referred to as “the creation of a single energy market”), as further described in Title IV.

#### **Article 4**

The Commission of the European Communities (hereinafter referred to as “the European Commission”) shall act as co-ordinator of the three activities described in Article 3.

#### **Article 5**

The Energy Community shall follow the *acquis communautaire* described in Title II, adapted to both the institutional framework of this Treaty and the specific situation of each of the Contracting Parties, with a view to ensuring high levels of investment security and optimal investments.

#### **Article 6**

The Parties shall take all appropriate measures, whether general or particular, to ensure fulfilment of the obligations arising out of this Treaty. The Parties shall facilitate the achievement of the Energy Community’s tasks. The Parties shall abstain from any measure which could jeopardise the attainment of the objectives of this Treaty.

#### **Article 7**

Any discrimination within the scope of this Treaty shall be prohibited.

#### **Article 8**

Nothing in this Treaty shall affect the rights of a Party to determine the conditions for exploiting its energy resources, its choice between different energy sources and the general structure of its energy supply.

## TITLE II – THE EXTENSION OF THE ACQUIS COMMUNAUTAIRE

### CHAPTER I – GEOGRAPHIC SCOPE

#### *Article 9*

The provisions of and the Measures taken under this Title shall apply to the territories of the Adhering Parties, and to the territory under the jurisdiction of the United Nations Interim Administration Mission in Kosovo.

### CHAPTER II – THE ACQUIS ON ENERGY

#### *Article 10*

Each Contracting Party shall implement the *acquis communautaire* on energy in compliance with the timetable for the implementation of those measures set out in Annex I.

#### *Article 11*

The “*acquis communautaire* on energy”, for the purpose of this Treaty, shall mean the acts listed in Annex I of this Treaty.<sup>2</sup>

### CHAPTER III – THE ACQUIS ON ENVIRONMENT

#### *Article 12*

Each Contracting Party shall implement the *acquis communautaire* on environment in compliance with the timetable for the implementation of those measures set out in Annex II.

#### *Article 13*

The Parties recognise the importance of the Kyoto Protocol. Each Contracting Party shall endeavour to accede to it.

#### *Article 14*

The Parties recognise the importance of the rules set out in Council Directive 96/61/EC of 24 September 1996 concerning integrated pollution prevention and control. Each Contracting Party shall endeavour to implement that Directive.

---

<sup>2</sup> Amended by Article 1 of Ministerial Council Decision 2011/02/MC-EnC of 6 October 2011 on the implementation of Directive 2009/72/EC, Directive 2009/73/EC, Regulation (EC) 714/2009 and Regulation (EC) 715/2009 and amending Articles 11 and 59 of the Energy Community Treaty.

### Article 15

After the entry into force of this Treaty, the construction and operation of new generating plants shall comply with the *acquis communautaire* on environment.

### Article 16

The “*acquis communautaire* on environment”, for the purpose of this Treaty, shall mean

- (i) Directive 2011/92/EU of the European Parliament and of the Council of 13 December 2011 on the assessment of the effects of certain public and private projects on the environment as amended by Directive 2014/52/EU,<sup>3</sup>
- (ii) Directive (EU) 2016/802 of the European Parliament and of the Council of 11 May 2016 relating to a reduction in the sulphur content of certain liquid fuels and Commission Implementing Decision (EU) 2015/253 of 16 February 2015 laying down the rules concerning the sampling and reporting under Council Directive 1999/32/EC as regards the sulphur content of marine fuels,<sup>4</sup>
- (iii) Directive 2001/80/EC of the European Parliament and of the Council of 23 October 2001 on the limitation of emissions of certain pollutants into the air from large combustion plants,<sup>5</sup>
- (iv) Article 4(2) of Directive 79/409/EEC of the Council of 2 April 1979 on the conservation of wild birds,
- (v) Chapter III, Annex V, and Article 72(3)-(4) of Directive 2010/75/EU of the European Parliament and of the Council of 24 November 2010 on industrial emissions (integrated pollution prevention and control),<sup>6</sup>
- (vi) Directive 2004/35/EC of the European Parliament and of the Council of 21 April 2004 on environmental liability with regard to the prevention and remedying of environmental damage, as amended by Directive 2006/21/EC, Directive 2009/31/EC and Directive 2013/30/EU<sup>7</sup>, and,
- (vii) Directive 2001/42/EC of the European Parliament and of the Council of 27 June 2001 on the assessment of the effects of certain plans and programmes on the environment.<sup>8</sup>

<sup>3</sup> Amended by the Ministerial Council Decision 2016/12/MC-EnC of 14 October 2016 on amending the Treaty establishing the Energy Community and adapting and implementing Directive (EU) 2016/802 of the European Parliament and of the Council and Commission Implementing Decision (EU) 2015/253.

<sup>4</sup> Amended by the Ministerial Council Decision 2016/15/MC-EnC of 14 October 2016 on amending the Treaty establishing the Energy Community and adapting and implementing Directive (EU) 2016/802 of the European Parliament and of the Council and Commission Implementing Decision (EU) 2015/253.

<sup>5</sup> Amended by the Ministerial Council Decision 2013/05/MC-EnC of 24 October 2013 on the implementation of Directive 2001/80/EC of 23 October 2001 on the limitation of emissions of certain pollutants into the air from large combustion plants and Decision 2015/07/MC-EnC on amending 2013/05/MC on implementation of Directive 2001/80/(EC) on limitation of certain emissions.

<sup>6</sup> Amended by the Ministerial Council Decision 2013/06/MC-EnC of 24 October 2013 on the implementation of Chapter III Annex V, and Article 72(3)-(4) of Directive 2010/75/EU of the European Parliament and of the Council of 24 November 2010 on industrial emissions (integrated pollution prevention and control) and amending Article 16 and Annex II of the Energy Community Treaty.

<sup>7</sup> Amended by the Ministerial Council Decision 2016/14/MC-EnC of 14 October 2016 on amending the Treaty establishing the Energy Community and adapting and implementing Directive 2004/35/EC of the European Parliament and of the Council.

<sup>8</sup> Amended by the Ministerial Council Decision 2016/13/MC-EnC of 14 October 2016 on amending the Treaty establishing the Energy Community and adapting and implementing Directive 2001/42/EC of the European Parliament and of the Council.

### **Article 17**

The provisions of and the Measures taken under this Chapter shall only apply to Network Energy.

## **CHAPTER IV – THE ACQUIS ON COMPETITION**

### **Article 18**

1. The following shall be incompatible with the proper functioning of the Treaty, insofar as they may affect trade of Network Energy between the Contracting Parties:

- (a) all agreements between undertakings, decisions by associations of undertakings and concerted practices which have as their object or effect the prevention, restriction or distortion of competition,
- (b) abuse by one or more undertakings of a dominant position in the market between the Contracting Parties as a whole or in a substantial part thereof,
- (c) any public aid which distorts or threatens to distort competition by favouring certain undertakings or certain energy resources.

2. Any practices contrary to this Article shall be assessed on the basis of criteria arising from the application of the rules of Articles 81, 82 and 87 of the Treaty establishing the European Community (attached in Annex III).

### **Article 19**

With regard to public undertakings and undertakings to which special or exclusive rights have been granted, each Contracting Party shall ensure that as from 6 months following the date of entry force of this Treaty, the principles of the Treaty establishing the European Community, in particular Article 86 (1) and (2) thereof (attached in Annex III), are upheld.

## **CHAPTER V – THE ACQUIS FOR RENEWABLES**

### **Article 20<sup>9</sup>**

Each Contracting Party shall implement Directive 2009/28/EC of the European Parliament and of the Council of 23 April 2009 on the promotion of the use of energy from renewable sources and amending and subsequently repealing Directives 2001/77/EC and 2003/30/EC.

## **CHAPTER VI – COMPLIANCE WITH GENERALLY APPLICABLE STANDARDS OF THE EUROPEAN COMMUNITY**

### **Article 21**

Within one year of the date of entry into force of this Treaty, the Secretariat shall draw up a list of the Generally Applicable Standards of the European Community, to be submitted to the Ministerial Council for adoption.

---

<sup>9</sup> Amended by Ministerial Council Decision 2012/04/MC-EnC of 18 October 2012 on the implementation of Directive 2009/28/EC and amending Article 20 of the Energy Community Treaty.

### **Article 22**

The Contracting Parties shall, within one year of the adoption of the list, adopt development plans to bring their Network Energy sectors into line with these Generally Applicable Standards of the European Community.

### **Article 23**

“Generally Applicable Standards of the European Community” shall refer to any technical system standard that is applied within the European Community, and is necessary for operating network systems safely and efficiently, including aspects of transmission, cross-border connections, modulation and general technical system security standards issued where applicable via the European Committee for Standardization (CEN), the European Committee for Electrotechnical Standardization (CENELEC) and similar normation bodies or as issued by the Union for the Co-ordination of Transmission of Electricity (UCTE) and the European Association for the Streamlining of Energy Exchanges (Easeegas) for common rule setting and business practices.

## **CHAPTER VII – THE ADAPTATION AND EVOLUTION OF THE ACQUIS**

### **Article 24**

For the implementation of this Title, the Energy Community shall adopt Measures adapting the *acquis communautaire* described in this Title, taking into account both the institutional framework of this Treaty and the specific situation of each of the Contracting Parties.

### **Article 25**

The Energy Community may take Measures to implement amendments to the *acquis communautaire* described in this Title, in line with the evolution of European Community law.

## **TITLE III – MECHANISM FOR OPERATION OF NETWORK ENERGY MARKETS**

### **CHAPTER I – GEOGRAPHIC SCOPE**

### **Article 26**

The provisions of and the Measures taken under this Title shall apply to the territories of the Adhering Parties, to the territory under the jurisdiction of the United Nations Interim Administration Mission in Kosovo, and to the territories of the European Community referred to in Article 27.

### **Article 27**

As regard the European Community, the provisions of and the Measures taken under this Title shall apply to the territories of the Hellenic Republic, of Hungary, of the Republic of Bulgaria, of the Republic of Croatia, of the Republic of Italy, of the Republic of Poland, of the Republic of Romania and of the Republic of Slovakia.<sup>10</sup> Upon accession to the European Union of an Adhering Party, the provisions of and the Measures taken under this Title shall, without any further formalities, also apply to the territory of that new Member State.

## **CHAPTER II – MECHANISM FOR LONG-DISTANCE TRANSPORTATION OF NETWORK ENERGY**

### **Article 28**

The Energy Community shall take additional Measures establishing a single mechanism for the cross-border transmission and/or transportation of Network Energy.

## **CHAPTER III – SECURITY OF SUPPLY**

### **Article 29**

The Parties shall, within one year of the date of entry into force of this Treaty, adopt security of supply statements describing in particular diversity of supply, technological security, and geographic origin of imported fuels. The statements shall be communicated to the Secretariat, and shall be available to any Party to this Treaty. They shall be updated every two years. The Secretariat shall give guidance and assistance with respect to such statements.

### **Article 30**

Article 29 does not imply a necessity to change energy policies or purchasing practices.

## **CHAPTER IV – PROVISION OF ENERGY TO CITIZENS**

### **Article 31**

The Energy Community shall promote high levels of provision of Network Energy to all its citizens within the limits of the public service obligations contained in the relevant *acquis communautaire* on energy.

### **Article 32**

For this purpose, the Energy Community may take Measures to:

(a) allow for the universal provision of electricity;

---

<sup>10</sup> Amended by Ministerial Council Decision 2015/09/MC-EnC on the implementation of Regulation (EU) 347/2013 of the European Parliament and the Council on guidelines for trans-European energy infrastructure.

- (b) foster effective demand management policies;
- (c) ensure fair competition.

#### **Article 33**

The Energy Community may also make Recommendations to support effective reform of the Network Energy sectors of the Parties, including *inter alia* to increase the level of payment for energy by all customers, and to foster the affordability of Network Energy prices to consumers.

### **CHAPTER V – HARMONISATION**

#### **Article 34**

The Energy Community may take Measures concerning compatibility of market designs for the operation of Network Energy markets, as well as mutual recognition of licenses and Measures fostering free establishment of Network Energy companies.

### **CHAPTER VI – RENEWABLE ENERGY SOURCES AND ENERGY EFFICIENCY**

#### **Article 35**

The Energy Community may adopt Measures to foster development in the areas of renewable energy sources and energy efficiency, taking account of their advantages for security of supply, environment protection, social cohesion and regional development.

### **CHAPTER VII – SAFEGUARD MEASURES**

#### **Article 36**

In the event of a sudden crisis on the Network Energy market in the territory of an Adhering Party, the territory under the jurisdiction of the United Nations Interim Administration Mission in Kosovo, or a territory of the European Community referred to in Article 27, where the physical safety or security of persons, or Network Energy apparatus or installations or system integrity is threatened in this territory, the concerned Party may temporarily take necessary safeguard measures.

#### **Article 37**

Such safeguard measures shall cause the least possible disturbance in the functioning of the Network Energy market of the Parties, and not be wider in scope than is strictly necessary to remedy the sudden difficulties which have arisen. They shall not distort competition or adversely affect trade in a manner which is at variance with the common interest.

### **Article 38**

The Party concerned shall without delay notify these safeguard measures to the Secretariat, which shall immediately inform the other Parties.

### **Article 39**

The Energy Community may decide that the safeguard measures taken by the Party concerned do not comply with the provisions of this Chapter, and request that Party to put an end to, or modify, those safeguard measures.

## **TITLE IV – THE CREATION OF A SINGLE ENERGY MARKET**

### **CHAPTER I – GEOGRAPHIC SCOPE**

#### **Article 40**

The provisions of and the Measures taken under this Title shall apply to the territories to which the Treaty establishing the European Community applies under the conditions laid down in that Treaty, to the territories of the Adhering Parties and to the territory under the jurisdiction of the United Nations Interim Mission in Kosovo.

### **CHAPTER II – INTERNAL ENERGY MARKET**

#### **Article 41**

1. Customs duties and quantitative restrictions on the import and export of Network Energy and all measures having equivalent effect, shall be prohibited between the Parties. This prohibition shall also apply to customs duties of a fiscal nature.
2. Paragraph 1 shall not preclude quantitative restrictions or measures having equivalent effect, justified on grounds of public policy or public security; the protection of health and life of humans, animals or plants, or the protection of industrial and commercial property. Such restrictions or measures shall not, however, constitute a means of arbitrary discrimination or a disguised restriction on trade between the Parties.

#### **Article 42**

1. The Energy Community may take Measures with the aim of creating a single market without internal frontiers for Network Energy.
2. Paragraph 1 shall not apply to fiscal measures, to those relating to the free movement of persons nor to those relating to the rights and interests of employed persons.

## CHAPTER III – EXTERNAL ENERGY TRADE POLICY

### *Article 43*

The Energy Community may take Measures necessary for the regulation of imports and exports of Network Energy to and from third countries with a view to ensuring equivalent access to and from third country markets in respect of basic environmental standards or to ensure the safe operation of the internal energy market.

## CHAPTER IV – MUTUAL ASSISTANCE IN THE EVENT OF DISRUPTION

### *Article 44*

In the event of disruption of Network Energy supply affecting a Party and involving another Party or a third country, the Parties shall seek an expeditious resolution in accordance with the provisions of this Chapter.

### *Article 45*

Upon request of the Party directly affected by the disruption, the Ministerial Council shall meet. The Ministerial Council may take the necessary Measures in response to the disruption.

### *Article 46*

Within one year of the date of entry into force of this Treaty, the Ministerial Council shall adopt a Procedural Act for the operation of the mutual assistance obligation under this Chapter, which may include the conferral of powers to take interim Measures to the Permanent High Level Group.

## TITLE V – INSTITUTIONS OF THE ENERGY COMMUNITY

### CHAPTER I - THE MINISTERIAL COUNCIL

#### *Article 47*

The Ministerial Council shall ensure that the objectives set out in this Treaty are attained. It shall:

- (a) provide general policy guidelines;
- (b) take Measures;
- (c) adopt Procedural Acts, which may include the conferral, under precise conditions, of specific tasks, powers and obligations to carry out the policy of the Energy Community on the Permanent High Level Group, the Regulatory Board or the Secretariat.

### **Article 48**

The Ministerial Council shall consist of one representative of each Contracting Party and two representatives of the European Community. One non-voting representative of each Participant may participate in its meetings.

### **Article 49**

The Ministerial Council shall adopt its internal rules of procedure by Procedural Act.

### **Article 50<sup>11</sup>**

The Presidency shall be held in turn by each Contracting Party for a term of one year in the order decided by a Procedural Act of the Ministerial Council. The Presidency shall convene the Ministerial Council in a place decided upon by the Presidency. The Ministerial Council shall meet at least once every year. The meetings shall be prepared by the Secretariat.

### **Article 51**

The Presidency shall chair the Ministerial Council and be assisted by one representative of the European Community and one representative of the incoming Presidency as Vice-Presidents. The Presidency and the Vice-Presidents shall prepare the draft Agenda.

### **Article 52**

The Ministerial Council shall submit an annual report on the activities of the Energy Community to the European Parliament and to the Parliaments of the Adhering Parties and of the Participants.

## **CHAPTER II - THE PERMANENT HIGH LEVEL GROUP**

### **Article 53**

The Permanent High Level Group shall:

- (a) prepare the work of the Ministerial Council;
- (b) give assent to technical assistance requests made by international donor organisations, international financial institutions and bilateral donors;
- (c) report to the Ministerial Council on progress made toward achievement of the objectives of this Treaty;
- (d) take Measures, if so empowered by the Ministerial Council;
- (e) adopt Procedural Acts, not involving the conferral of tasks, powers or obligations on other institutions of the Energy Community;
- (f) discuss the development of the *acquis communautaire* described in Title II on the basis of a report that the European Commission shall submit on a regular basis.

---

<sup>11</sup> Amended by Ministerial Council Decision 2009/02/MC-EnC of 18 December 2009 amending the Treaty establishing the Energy Community with regard to the frequency of Ministerial Council meetings.

**Article 54**

The Permanent High Level Group shall consist of one representative of each Contracting Party and two representatives of the European Community. One non-voting representative of each Participant may participate in its meetings.

**Article 55**

The Permanent High Level Group shall adopt its internal rules of procedure as a Procedural Act.

**Article 56**

The Presidency shall convene the Permanent High Level Group at a place to be determined by the Presidency. The meetings shall be prepared by the Secretariat.

**Article 57**

The Presidency shall chair the Permanent High Level Group and be assisted by one representative of the European Community and one representative of the incoming Presidency as Vice-Presidents. The Presidency and the Vice-Presidents shall prepare the draft Agenda.

**CHAPTER III – THE REGULATORY BOARD****Article 58**

The Regulatory Board shall:

- (a) advise the Ministerial Council or the Permanent High Level Group on the details of statutory, technical and regulatory rules;
- (b) issue Recommendations on cross-border disputes involving two or more Regulators, upon request of any of them;
- (c) take Measures, if so empowered by the Ministerial Council;
- (d) adopt Procedural Acts.

**Article 59<sup>12</sup>**

The Regulatory Board shall be composed of one representative of the energy regulator of each Contracting Party, pursuant to the relevant parts of the *acquis communautaire* on energy. The European Union shall be represented by the European Commission, assisted by one regulator of each Participant, and one representative of the Agency for the Cooperation of Energy Regulators.

---

<sup>12</sup> Amended by Ministerial Council Decision 2011/02/MC-EnC of 6 October 2011 on the implementation of Directive 2009/72/EC, Directive 2009/73/EC, Regulation (EC) 714/2009 and Regulation (EC) 715/2009 and amending Articles 11 and 59 of the Energy Community Treaty.

### **Article 60**

The Regulatory Board shall adopt its internal rules of procedure by Procedural Act.

### **Article 61**

The Regulatory Board shall elect a President for a term determined by the Regulatory Board. The European Commission shall act as Vice-President. The President and the Vice-President shall prepare the draft Agenda.

### **Article 62**

The Regulatory Board shall meet in Athens.

## **CHAPTER IV - THE FORA**

### **Article 63**

Two Fora, composed of representatives of all interested stakeholders, including industry, regulators, industry representative groups and consumers, shall advise the Energy Community.<sup>13</sup>

### **Article 64**

The Fora shall be chaired by a representative of the European Community.

### **Article 65**

The conclusions of the Fora shall be adopted by consensus. They shall be forwarded to the Permanent High Level Group.

### **Article 66**

The Electricity Forum shall meet in Athens. The Gas Forum shall meet at a place to be determined by a Procedural Act of the Ministerial Council.<sup>14</sup>

---

<sup>13</sup> Pursuant to Decision 2008/03/MC-EnC of 18 December 2008 concerning the implementation to the oil sector of certain provisions of the Treaty and the creation of an Energy Community Oil Forum, the Ministerial Council established the Oil Forum.

<sup>14</sup> According to Article 1 of Procedural Act 2007/03/2/PHLG-EnC of 17 October 2007 on the seat of the Gas Forum, the Gas Forum is to be set up in cooperation with the competent Slovenian authorities. According to Article 2 of the Decision 2008/03/MC-EnC of 18 December 2008 Oil Forum shall meet in Belgrade, Serbia.

## CHAPTER V - THE SECRETARIAT

### **Article 67**

The Secretariat shall:

- (a) provide administrative support to the Ministerial Council, the Permanent High Level Group, the Regulatory Board and the Fora;
- (b) review the proper implementation by the Parties of their obligations under this Treaty, and submit yearly progress reports to the Ministerial Council;
- (c) review and assist in the coordination by the European Commission of the donors' activity in the territories of the Adhering Parties and the territory under the jurisdiction of the United Nations Interim Administration Mission in Kosovo, and provide administrative support to the donors;
- (d) carry out other tasks conferred on it under this Treaty or by a Procedural Act of the Ministerial Council, excluding the power to take Measures; and
- (e) adopt Procedural Acts.

### **Article 68**

The Secretariat shall comprise a Director and such staff as the Energy Community may require.

### **Article 69**

The Director of the Secretariat shall be appointed by a Procedural Act of the Ministerial Council. The Ministerial Council shall lay down, by Procedural Act, rules for the recruitment, working conditions and geographic equilibrium of the Secretariat's staff. The Director shall select and appoint the staff.

### **Article 70**

In the performance of their duties the Director and the staff shall not seek or receive instructions from any Party to this Treaty. They shall act impartially and promote the interests of the Energy Community.

### **Article 71**

The Director of the Secretariat or a nominated alternate shall assist at the Ministerial Council, the Permanent High Level Group, the Regulatory Board and the Fora.

### **Article 72**

The seat of the Secretariat shall be in Vienna.

## CHAPTER VI – BUDGET

### *Article 73*

Each Party shall contribute to the budget of the Energy Community as set out in Annex IV. The level of contributions may be reviewed every five years, on request of any Party, by a Procedural Act of the Ministerial Council.

### *Article 74*

The Ministerial Council shall adopt the budget of the Energy Community by Procedural Act every two years. The budget shall cover the operational expenses of the Energy Community necessary for the functioning of its institutions. The expenditure of each institution shall be set out in a different part of the budget. The Ministerial Council shall adopt a Procedural Act specifying the procedure for the implementation of the budget, and for presenting and auditing accounts and inspection.

### *Article 75*

The Director of the Secretariat shall implement the budget in accordance with the Procedural Act adopted pursuant to Article 74, and shall report annually to the Ministerial Council on the execution of the budget. The Ministerial Council may decide by Procedural Act, if appropriate, to entrust independent auditors with verifying the proper execution of the budget.

## TITLE VI – DECISION MAKING PROCESS

### CHAPTER I – GENERAL PROVISIONS

#### *Article 76*

Measures may take the form of a Decision or a Recommendation.

A Decision is legally binding in its entirety upon those to whom it is addressed.

A Recommendation has no binding force. Parties shall use their best endeavours to carry out Recommendations.

#### *Article 77*

Save as provided in Article 80, each Party shall have one vote.

#### *Article 78*

The Ministerial Council, the Permanent High Level Group or the Regulatory Board may act only if two third of the Parties are represented. Abstentions in a vote from Parties present shall not count as votes cast.

## CHAPTER II – MEASURES UNDER TITLE II

### *Article 79*

The Ministerial Council, the Permanent High Level Group or the Regulatory Board shall take Measures under Title II on a proposal from the European Commission. The European Commission may alter or withdraw its proposal at any time during the procedure leading to adoption of the Measures.

### *Article 80*

Each Contracting Party shall have one vote.

### *Article 81*

The Ministerial Council, the Permanent High Level Group or the Regulatory Board shall act by a majority of the votes cast.

## CHAPTER III – MEASURES UNDER TITLE III

### *Article 82*

The Ministerial Council, the Permanent High Level Group or the Regulatory Board shall take Measures under Title III on a proposal from a Party or the Secretariat.

### *Article 83*

The Ministerial Council, the Permanent High Level Group or the Regulatory Board shall act by a two third majority of the votes cast, including a positive vote of the European Community.

## CHAPTER IV – MEASURES UNDER TITLE IV

### *Article 84*

The Ministerial Council, the Permanent High Level Group or the Regulatory Board shall take Measures under Title IV on a proposal from a Party.

### *Article 85*

The Ministerial Council, the Permanent High Level Group or the Regulatory Board shall take Measures by unanimity.

## CHAPTER V – PROCEDURAL ACTS

### *Article 86*

A Procedural Act shall regulate organizational, budgetary and transparency issues of the Energy Community, including the delegation of power from the Ministerial Council to the Permanent High Level Group, the Regulatory Board or the Secretariat, and shall have binding force on the institutions of the Energy Community, and, if the Procedural Act so provides, on the Parties.

### *Article 87*

Save as provided in Article 88, Procedural Acts shall be adopted in compliance with the Decision Making Process set out in Chapter III of this Title.

### *Article 88*

The Procedural Act appointing the Director of the Secretariat provided for in Article 69 shall be adopted by simple majority on a proposal from the European Commission. The Procedural Acts on budgetary matters provided for in Articles 73 and 74 shall be adopted by unanimity on a proposal from the European Commission. The Procedural Acts conferring powers on the Regulatory Board provided for in Article 47(c) shall be taken by unanimity on a proposal from a Party or the Secretariat.

## TITLE VII - IMPLEMENTATION OF DECISIONS AND DISPUTE SETTLEMENT

### *Article 89*

The Parties shall implement Decisions addressed to them in their domestic legal system within the period specified in the Decision.

### *Article 90*

1. Failure by a Party to comply with a Treaty obligation or to implement a Decision addressed to it within the required period may be brought to the attention of the Ministerial Council by a reasoned request of any Party, the Secretariat or the Regulatory Board. Private bodies may approach the Secretariat with complaints.
2. The Party concerned may make observations in response to the request or complaint.

### *Article 91*

1. The Ministerial Council may determine the existence of a breach by a Party of its obligations. The Ministerial Council shall decide:

- (a) by a simple majority, if the breach relates to Title II;
- (b) by a two-third majority, if the breach relates to Title III;
- (c) by unanimity, if the breach relates to Title IV.

2. The Ministerial Council may subsequently decide by simple majority to revoke any decisions adopted under this Article.

#### **Article 92**

1. At the request of a Party, the Secretariat or the Regulatory Board, the Ministerial Council, acting by unanimity, may determine the existence of a serious and persistent breach by a Party of its obligations under this Treaty and may suspend certain of the rights deriving from application of this Treaty to the Party concerned, including the suspension of voting rights and exclusion from meetings or mechanisms provided for in this Treaty.

2. The Ministerial Council may subsequently decide by simple majority to revoke any decisions taken under this Article.

#### **Article 93**

When adopting the decisions referred to in Articles 91 and 92, the Ministerial Council shall act without taking into account the vote of the representative of the Party concerned.

## **TITLE VIII - INTERPRETATION**

#### **Article 94**

The institutions shall interpret any term or other concept used in this Treaty that is derived from European Community law in conformity with the case law of the Court of Justice or the Court of First Instance of the European Communities. Where no interpretation from those Courts is available, the Ministerial Council shall give guidance in interpreting this Treaty. It may delegate that task to the Permanent High Level Group. Such guidance shall not prejudice any interpretation of the *acquis communautaire* by the Court of Justice or the Court of First Instance at a later stage.

## **TITLE IX – PARTICIPANTS AND OBSERVERS**

#### **Article 95**

Upon a request to the Ministerial Council, any Member State of the European Community may be represented in the Ministerial Council, the Permanent High Level Group and the Regulatory Board under the conditions laid down in Articles 48, 54 and 59 as a Participant, and shall be permitted to

participate in the discussions of the Ministerial Council, the Permanent High Level Group, the Regulatory Board and the Fora.

#### **Article 96**

1. Upon a reasoned request of a neighbouring third country, the Ministerial Council may, by unanimity, accept that country as an Observer. Upon a request presented to the Ministerial Council within six months of the date of entry into force of this Treaty, Moldova shall be accepted as an Observer.
2. Observers may attend the meetings of the Ministerial Council, the Permanent High Level Group, the Regulatory Board and the Fora, without participating in the discussions.

## **TITLE X - DURATION**

#### **Article 97**

This Treaty is concluded for a period of 10 years from the date of entry into force<sup>15</sup>. The Ministerial Council, acting by unanimity, may decide to extend its duration. If no such decision is taken, the Treaty may continue to apply between those Parties who voted in favour of extension, provided that their number amounted to at least two thirds of the Parties to the Energy Community.

#### **Article 98**

Any party may withdraw from this Treaty by giving six months notice, addressed to the Secretariat.

#### **Article 99**

Upon accession to the European Community of an Adhering Party, that party shall become a Participant as provided for in Article 95.

## **TITLE XI – REVISION AND ACCESSION**

#### **Article 100**

The Ministerial Council may, by unanimity of its Members:

- (i) amend the provisions of Title I to VII;
- (ii) decide to implement other parts of the *acquis communautaire* related to Network Energy;
- (iii) extend this Treaty to other energy products and carriers or other essential network infrastructures;
- (iv) agree on the accession to the Energy Community of a new Party.

---

<sup>15</sup> According to Ministerial Council Decision 2013/03/MC-EnC on extending the duration of the Energy Community Treaty, the duration of the Treaty is extended for a period of 10 years.

## TITLE XII - FINAL AND TRANSITIONAL PROVISIONS

### **Article 101**

Without prejudice to Articles 102 and 103, the rights and obligations arising from agreements concluded by a Contracting Party before the signature of this Treaty shall not be affected by the provisions of this Treaty. To the extent that such agreements are not compatible with this Treaty, the Contracting Party concerned shall take all appropriate measures to eliminate the incompatibilities established, no later than one year after the date of entry into force of this Treaty.

### **Article 102**

All obligations under this Treaty are without prejudice to existing legal obligations of the Parties under the Treaty establishing the World Trade Organisation.

### **Article 103**

Any obligations under an agreement between the European Community and its Member States on the one hand, and a Contracting Party on the other hand shall not be affected by this Treaty. Any commitment taken in the context of negotiations for accession to the European Union shall not be affected by this Treaty.

### **Article 104**

Until the adoption of the Procedural Act referred to in Article 50, the 2003 Athens Memorandum of Understanding<sup>16</sup> shall define the order for holding the Presidency.<sup>17</sup>

### **Article 105**

This Treaty shall be approved by the Parties in accordance with their internal procedures. This Treaty shall enter into force on the first day of the month following the date on which the European Community and six Contracting Parties have notified the completion of the procedures necessary for this purpose. Notification shall be sent to the Secretary-General of the Council of the European Union who shall be the depositary for this Treaty.

In witness thereof the duly authorised representatives have signed this Treaty.

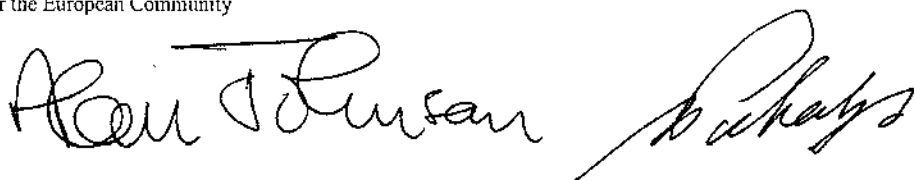

---

<sup>16</sup> Memorandum of Understanding on the Regional Energy Market in South East Europe and its Integration into the European Community Internal Energy Market, signed in Athens on 8 December 2003.

<sup>17</sup> According to Annex point III(1) of Procedural Act 2006/01/MC-EnC of 17 November 2006 on adoption of Internal Rules of Procedures of Ministerial Council of Energy Community, the Presidency of the Council shall be held in turn by each Contracting Party in alphabetical order, following the names of the Parties as indicated in the Treaty.

Done at Athens, on the twenty-fifth day of October in the year two thousand and five.

For the European Community

A handwritten signature in black ink, appearing to read "Jean-Pierre Lecoq". The signature is fluid and cursive, with a long, sweeping tail on the final letter.

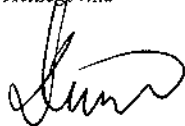

For the Republic of Albania

A handwritten signature in black ink, appearing to read "Gene Ruben". The signature is written in a cursive style with distinct loops and a horizontal line at the end.

For the Republic of Bulgaria

A handwritten signature in black ink, appearing to read "L. L. L.". The signature is highly stylized and cursive, with a prominent loop at the end.

For Bosnia and Herzegovina

A handwritten signature in black ink, appearing to read "L. L. L.". The signature is cursive and somewhat compact, with a clear loop at the end.

For the Republic of Croatia

A handwritten signature in black ink, appearing to read "P. P. P.". The signature is cursive and features a large, sweeping loop at the end.

For the former Yugoslav Republic of Macedonia

For the Republic of Montenegro

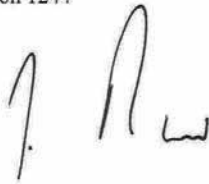

For Romania

For the Republic of Serbia

For the United Nations Interim Administration Mission in Kosovo pursuant to the United Nations Security Council Resolution 1244

Republic of Macedonia  
– Office of the Deputy Prime Minister –  
Minčo Jordanov

Athens, 25 October 2005

*Your Excellency,*

*Hereby I declare that the text of the Treaty establishing the Energy Community is acceptable for the Government of the Republic of Macedonia.*

*With this letter, the Government of the Republic of Macedonia considers itself as signatory of the Treaty establishing the Energy Community.*

*However, I declare that the Republic of Macedonia does not accept the denomination used for my country in the above-mentioned documents having in view that the constitutional name of my country is the Republic of Macedonia.*

*Please accept, Your Excellency, the assurances of my highest consideration.*

Minčo Jordanov

**THE EUROPEAN COMMUNITY**

Brussels

**COUNCIL OF  
THE EUROPEAN UNION**  
The Presidency

Athens, 25 October 2005

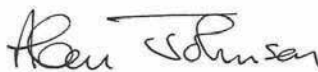

Mr. Minco Jordanov,  
Vice-President of the Government  
of the former Yugoslav Republic of Macedonia.

Sir,

The European Community takes note of your letter of today's date and confirms that your letter and this reply shall together take the place of the signature of the Treaty establishing the Energy Community by the former Yugoslav Republic of Macedonia. However, this cannot be construed as acceptance or recognition by the European Community, in whatever form or content of a denomination other than "former Yugoslav Republic of Macedonia".

Please accept, Sir, the assurance of my highest consideration.

On behalf of  
the European Community

UNITED NATIONS  
United Nations Interim  
Administration Mission in  
Kosovo

NATIONS UNIES  
Mission d'Administration  
Intérimaire des Nations Unies  
au Kosovo

## DECLARATION

I, Søren Jessen-Petersen, Special Representative of the Secretary General and Head of the United Nations Interim Administration Mission in Kosovo (UNMIK),

HEREBY DECLARE that the United Nations Interim Administration Mission in Kosovo (UNMIK) is signing the Treaty establishing the Energy Community on 25 October 2005, subject to the following terms:

- (i) The United Nations Interim Administration Mission in Kosovo (UNMIK) established by Security Council resolution 1244 (1999) of 10 June 1999 signs the Treaty on behalf of Kosovo;
- (ii) The Treaty is valid in respect of Kosovo for the duration of UNMIK administration under resolution 1244 (1999), and its continued validity beyond that would depend on the future administration of Kosovo; and
- (iii) The conclusion of the Treaty on the part of UNMIK is without prejudice to the future status of Kosovo.

Furthermore, the Treaty does not engage the responsibility of the United Nations, nor does it create for the Organization any legal, financial or other obligations.

I request that this Declaration be duly recorded and form part of the official records of the Treaty.

IN WITNESS WHEREOF, I have hereto set my hand and seal.

Done at Pristina on 21 October 2005.

Søren Jessen-Petersen  
Special Representative of the Secretary General

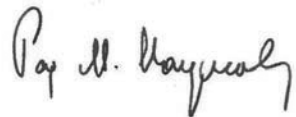

## STATEMENT

### **Of the Serbian Delegation at the Ceremony of the signing of the Treaty establishing the Energy Community**

"The Government of the Republic of Serbia would like to state that the signing of the Treaty establishing the Energy Community on behalf of the Special Representative of the Secretary General United Nations Interim Administration Mission in Kosovo shall in no way prejudice the final status of Kosovo and Metohija. The Government of the Republic of Serbia recalls the UN Security Council Resolution 1244 reaffirming the commitment of all Member States to the sovereignty and territorial integrity of the Serbia and Montenegro."

Athens, October 25, 2005

## ANNEX I

### LIST OF ACTS INCLUDED IN THE “ACQUIS COMMUNAUTAIRE ON ENERGY”

- (1) Directive 2009/72/EC of 13 July 2009 concerning common rules for the internal market in electricity, as adopted by Ministerial Council Decision 2011/02/MC-EnC of 6 October 2011.
- (2) Directive 2009/73/EC of 13 July 2009 concerning common rules for the internal market in natural gas, as adopted by Ministerial Council Decision 2011/02/MC-EnC of 6 October 2011.
- (3) Regulation (EC) 714/2009 of 13 July 2009 on conditions for access to the network for cross-border exchanges in electricity, as adopted by Ministerial Council Decision 2011/02/MC-EnC of 6 October 2011.
- (4) Regulation (EC) 715/2009 of 13 July 2009 on conditions for access to the natural gas transmission networks, as amended by Commission Decision 2010/685/EU of 10 November 2010, as adopted by Ministerial Council Decision 2011/02/MC-EnC of 6 October 2011.
- (5) Directive 2005/89/ of 18 January 2006 concerning measures to safeguard security of electricity supply and infrastructure investment, as adopted by Ministerial Council Decision 2007/06/MC-EnC of 18 December 2007.
- (6) Directive 2004/67/EC of 26 April 2004 concerning measures to safeguard security of natural gas supply, as adopted by Ministerial Council Decision 2007/06/MC-EnC of 18 December 2007.
- (7) Regulation (EU) 347/2013 of 17 April 2013 on guidelines for trans-European energy infrastructure, as adopted by Ministerial Council Decision 2015/09/MC-EnC of 16 October 2015.
- (8) Regulation (EU) 838/2010 of 23 September 2010 on laying down guidelines relating to the inter-transmission system operator compensation mechanism and a common regulatory approach to transmission charging
- (9) Regulation (EU) 543/2013 of 14 June 2013 on submission and publication of data in electricity markets
- (10) Regulation (EU) 2016/1388 of 17 August 2016 establishing a network code on demand connection
- (11) Regulation (EU) 2016/631 of 14 April 2016 establishing a network code on requirements for grid connection of generators
- (12) Regulation (EU) 2016/1447 of 26 August 2016 establishing a network code on requirements for grid connection of high voltage direct current systems and direct current-connected power park modules
- (13) Regulation (EU) 1227/2011 of 25 October 2011 on wholesale energy market integrity and transparency
- (14) Regulation (EC) 715/2009 of 13 July 2009 on conditions for access to the natural gas transmission networks
- (15) Regulation (EU) 703/2015 of 30 April 2015 establishing a network code on interoperability and data exchange rules
- (16) Regulation (EU) 2017/459 of 16 March 2017 establishing a network code on capacity allocation mechanisms in gas transmission systems and repealing Regulation (EU) 984/2013
- (17) Regulation (EU) 2017/460 of 16 March 2017 establishing a network code on harmonized transmission tariff structures for gas
- (18) Regulation (EU) 312/2014 of 26 March 2014 establishing a network code on gas balancing of transmission networks

## ANNEX II

### TIMETABLE FOR THE IMPLEMENTATION OF THE ACQUIS ON ENVIRONMENT

1. Each Contracting Party shall implement Directive 2011/92/EU of the European Parliament and of the Council of 13 December 2011 on the assessment of the effects of certain public and private projects on the environment by 14 October 2016. Each Contracting Party shall implement Directive 2014/52/EU by 1 January 2019, with the exception of the provisions referring to Directives not covered by Article 16 of this Treaty.
2. Each Contracting Party shall implement Council Directive 1999/32/EC of 26 April 1999 relating to a reduction in the sulphur content of certain liquid fuels and amending Directive 93/12/EEC by 31 December 2011.
- 2a. Each Contracting Party shall implement Directive (EU) 2016/802 of the European Parliament and of the Council of 11 May 2016 relating to a reduction in the sulphur content of certain liquid fuels and Commission Implementing Decision (EU) 2015/253 of 16 February 2015 laying down the rules concerning the sampling and reporting under Council Directive 1999/32/EC as regards the sulphur content of marine fuels by 30 June 2018.
3. Each Contracting Party shall implement Directive 2001/80/EC of the European Parliament and of the Council of 23 October 2001 on the limitation of emissions of certain pollutants into the air from large combustion plants by 31 December 2017.
4. Each Contracting Party shall implement Article 4(2) of Directive 79/409/EEC of the Council of 2 April 1979 on the conservation of wild birds on the entry into force of this Treaty.
5. Each Contracting Party shall implement Chapter III, Annex V, and Article 72(3)-(4) of Directive 2010/75/EU of the European Parliament and of the Council of 24 November 2010 on industrial emissions (integrated pollution prevention and control) from 1 January 2018 for new plants. For existing plants, Contracting Parties shall implement those provisions by 1 January 2028 at the latest. Prior to that date, they shall endeavour to implement the provisions of Chapter III and Annex V within the shortest possible timeframe, in particular in the cases of retrofitting existing plants. Ukraine shall implement those provisions by 1 January 2029 at the latest for SO<sub>2</sub> and dust and by 1 January 2034 at the latest for NO<sub>x</sub>.<sup>1</sup>
6. Each Contracting Party shall implement Directive 2004/35/EU of the European Parliament and of the Council of 21 April 2004 on environmental liability with regard to the prevention and remedying of environmental damage, as amended by Directive 2006/21/EC, Directive 2009/31/EC and Directive 2013/30/EU by 1 January 2021.
7. Each Contracting Party shall transpose Directive 2001/42/EC of the European Parliament and of the Council of 27 June 2001 on the assessment of the effects of certain plans and programmes on the environment by 1 January 2018 and implement those provisions by 31 March 2018.

---

<sup>1</sup> Amended by the Ministerial Council Decision 2015/07/MC-EnC on amending Decision D/2013/05/MC-EnC of 24 October 2013 on the implementation of Directive 2001/80/EC of the European Parliament and of the Council on the limitation of emissions of certain pollutants into the air from large combustion plants and on amending Annex II of the Energy Community Treaty.

## ANNEX III

### EC COMPETITION RULES

#### *Article 81 of the EC Treaty*

1. The following shall be prohibited as incompatible with the common market: all agreements between undertakings, decisions by associations of undertakings and concerted practices which may affect trade between Member States and which have as their object or effect the prevention, restriction or distortion of competition within the common market, and in particular those which:

- (a) directly or indirectly fix purchase or selling prices or any other trading conditions;
- (b) limit or control production, markets, technical development, or investment;
- (c) share markets or sources of supply;
- (d) apply dissimilar conditions to equivalent transactions with other trading parties, thereby placing them at a competitive disadvantage;
- (e) make the conclusion of contracts subject to acceptance by the other parties of supplementary obligations which, by their nature or according to commercial usage, have no connection with the subject of such contracts.

2. Any agreements or decisions prohibited pursuant to this article shall be automatically void.

3. The provisions of paragraph 1 may, however, be declared inapplicable in the case of:

- any agreement or category of agreements between undertakings,
- any decision or category of decisions by associations of undertakings,
- any concerted practice or category of concerted practices,

which contributes to improving the production or distribution of goods or to promoting technical or economic progress, while allowing consumers a fair share of the resulting benefit, and which does not:

- (a) impose on the undertakings concerned restrictions which are not indispensable to the attainment of these objectives;
- (b) afford such undertakings the possibility of eliminating competition in respect of a substantial part of the products in question.

#### *Article 82 of the EC Treaty*

Any abuse by one or more undertakings of a dominant position within the common market or in a substantial part of it shall be prohibited as incompatible with the common market in so far as it may affect trade between Member States.

Such abuse may, in particular, consist in:

- (a) directly or indirectly imposing unfair purchase or selling prices or other unfair trading conditions;
- (b) limiting production, markets or technical development to the prejudice of consumers;
- (c) applying dissimilar conditions to equivalent transactions with other trading parties, thereby placing them at a competitive disadvantage;
- (d) making the conclusion of contracts subject to acceptance by the other parties of supplementary obligations which, by their nature or according to commercial usage, have no connection with the subject of such contracts.

### ***Article 86(1) and (2) of the EC Treaty***

1. In the case of public undertakings and undertakings to which Member States grant special or exclusive rights, Member States shall neither enact nor maintain in force any measure contrary to the rules contained in this Treaty, in particular to those rules provided for in Article 12 and Articles 81 to 89.
2. Undertakings entrusted with the operation of services of general economic interest or having the character of a revenue-producing monopoly shall be subject to the rules contained in this Treaty, in particular to the rules on competition, in so far as the application of such rules does not obstruct the performance, in law or in fact, of the particular tasks assigned to them. The development of trade must not be affected to such an extent as would be contrary to the interests of the Community.

### ***Article 87 of the EC Treaty***

1. Save as otherwise provided in this Treaty, any aid granted by a Member State or through State resources in any form whatsoever which distorts or threatens to distort competition by favouring certain undertakings or the production of certain goods shall, in so far as it affects trade between Member States, be incompatible with the common market.
2. The following shall be compatible with the common market:
  - (a) aid having a social character, granted to individual consumers, provided that such aid is granted without discrimination related to the origin of the products concerned;
  - (b) aid to make good the damage caused by natural disasters or exceptional occurrences;
  - (c) aid granted to the economy of certain areas of the Federal Republic of Germany affected by the division of Germany, in so far as such aid is required in order to compensate for the economic disadvantages caused by that division.
3. The following may be considered to be compatible with the common market:
  - (a) aid to promote the economic development of areas where the standard of living is abnormally low or where there is serious underemployment;
  - (b) aid to promote the execution of an important project of common European interest or to remedy a serious disturbance in the economy of a Member State;
  - (c) aid to facilitate the development of certain economic activities or of certain economic areas, where such aid does not adversely affect trading conditions to an extent contrary to the common interest;
  - (d) aid to promote culture and heritage conservation where such aid does not affect trading conditions and competition in the Community to an extent that is contrary to the common interest;
  - (e) such other categories of aid as may be specified by decision of the Council acting by a qualified majority on a proposal from the Commission.

**PROTOCOL  
CONCERNING THE ACCESSION OF THE REPUBLIC OF MOLDOVA  
TO THE TREATY ESTABLISHING THE ENERGY COMMUNITY**

The Energy Community, in accordance with the Treaty establishing the Energy Community (hereinafter - the Treaty) on the one hand,

and the Republic of Moldova on the other hand,

Taking note of the outcome of negotiations on the Republic of Moldova's accession to the Energy Community,

Having regard to the Decision of the Ministerial Council of the Energy Community of 18 December 2009 approving the accession of the Republic of Moldova to the Energy Community on the conditions set out herein (Decision 2009/03/MC-EnC),

AGREED ON THE FOLLOWING:

***Article 1***

1. The Republic of Moldova accedes to the Energy Community as a Contracting Party under the terms and conditions set out in the Decision of the Ministerial Council of the Energy Community of 18 December 2009 on the accession of the Republic of Moldova to the Energy Community (Decision 2009/03/MC-EnC), as laid down in this Protocol.

2. Unless specified otherwise in this Protocol, by date of accession, the Republic of Moldova is entitled to all rights granted to Contracting Parties and is subject to all obligations imposed on Contracting Parties by the Treaty and by all Decisions and Procedural Acts adopted in application of the Treaty since its entry into force.

***Article 2***

1. For the purpose of compliance with Title II of the Treaty establishing the Energy Community and its related Annexes, the timetable for implementation by the Republic of Moldova of the *acquis communautaire* is defined as follows:

Directive 2003/55/EC concerning common rules for the internal market in natural gas	By 31 December 2009
Regulation 1775/2005 on conditions for access to the natural gas transmission networks	By 31 December 2010
Directive 2004/67/EC concerning measures to safeguard security of natural gas supply	By 31 December 2010
Directive 2003/54/EC concerning common rules for the internal market in electricity	By 31 December 2009
Regulation 1228/2003 on conditions for access to the network for cross-border exchanges in electricity	By 31 December 2010
Commission Decision 2006/770/EC amending the Annex to Regulation No 1228/2003 on conditions for access to the network for cross-border exchanges in electricity	By 31 December 2010
Directive 2005/89/EC concerning measures to safeguard security of electricity supply and infrastructure investment	By 31 December 2010
Directive 85/337/EEC on the assessment of the effects of certain public and private projects on the environment, as amended by Directive 97/11/EC and Directive 2003/35/EC	By 31 December 2010
Directive 1999/32/EC relating to a reduction in the sulphur content of certain liquid fuels	By 31 December 2014
Directive 2001/80/EC on the limitation of emissions of certain pollutants into the air from large combustion plants	By 31 December 2017
Directive 79/409/EC, Article 4(2), on the conservation of wild birds	By 31 December 2010
Plan for the implementation of Directive 2001/77/EEC on the promotion of electricity produced from renewable energy sources in the internal electricity market	By 31 December 2010
Plan for the implementation of Directive 2003/30/EC on the promotion of the use of biofuels or other renewable fuels for transport	By 31 December 2010

2. The Republic of Moldova must ensure that the eligible customers within the meaning of EC Directives 2003/54/EC and 2003/55/EC are:

- From 1 January 2013, all non-household customers; and
- From 1 January 2015, all customers.

3. In Article 19 of the Treaty, the reference “as from six months following the date of entry into force of this Treaty” shall be understood as meaning “as from six months following the date of accession of the Republic of Moldova”. In Article 22 of the Treaty, the reference “within one year of the adoption of the list” shall be understood as meaning “within one year of the date of accession of the Republic of Moldova”. In Article 29 of the Treaty, the reference “within one year of the date of entry into force of this Treaty” shall be understood as meaning “within one year of the date of accession of the Republic of Moldova”.

4. Article 15 of the Treaty shall apply to the Republic of Moldova as from one year following the date of accession of the Republic of Moldova.

### **Article 3**

1. The contribution of the Republic of Moldova and of the other Parties to the budget of the Energy Community shall be set out in a Procedural Act to be adopted pursuant to Article 73 of the Treaty. The methodology to be applied shall be based on a pro-rata calculated in relation to GDP and Total Primary Energy Supply.

2. The first contribution of the Republic of Moldova shall be due for the first full budgetary year following accession.

### **Article 4**

1. After adoption by the Ministerial Council of the Energy Community of its Decision on the Republic of Moldova's accession to the Energy Community, the Republic of Moldova shall initiate its internal procedures required for entry into force of its accession to the Energy Community.

2. The accession to the Energy Community shall enter into force on the first day of the second month following the month of completion of the procedures provided in the first paragraph of this article.

Done at Vienna, this seventeenth day of March in the year two thousand and ten.

For the Republic of Moldova

## PROTOCOL CONCERNING THE ACCESSION OF UKRAINE TO THE TREATY ESTABLISHING THE ENERGY COMMUNITY

The Energy Community, in accordance with the Treaty establishing the Energy Community (hereinafter - the Treaty) on the one hand,

And Ukraine on the other hand,

Taking note of the outcome of negotiations on Ukraine's accession to the Energy Community Treaty,

Having regard to the Decision of the Ministerial Council of the Energy Community of 18 December 2009 approving the accession of Ukraine to the Energy Community Treaty on the conditions set out herein (Decision 2009/04/MC-EnC),

AGREED ON THE FOLLOWING:

### **Article 1**

1. Ukraine accedes to the Treaty establishing the Energy Community as a Contracting Party under the terms and conditions set out in the Decision of the Ministerial Council of the Energy Community of 18 December 2009 on the accession of Ukraine to the Energy Community Treaty (Decision 2009/04/MC-EnC), as laid down in this Protocol.

2. Unless specified otherwise in this Protocol, by date of accession, Ukraine is entitled to all rights granted to Contracting Parties and is subject to all obligations imposed on Contracting Parties by the Treaty and by all Decisions and Procedural Acts adopted in application of the Treaty since its entry into force.

### **Article 2**

1. For the purposes of compliance with Title II of the Treaty establishing the Energy Community and its related Annexes, the timetable for implementation of the *acquis communautaire* is defined as follows:

Directive 2003/55/EC concerning common rules for the internal market in natural gas	By 1st January 2012
Regulation 1775/2005 on conditions for access to the natural gas transmission networks	By 1st January 2012
Directive 2004/67/EC concerning measures to safeguard security of natural gas supply	By 1st January 2012
Directive 2003/54/EC concerning common rules for the internal market in electricity	By 1st January 2012

Regulation 1228/2003 on conditions for access to the network for cross-border exchanges in electricity	By 1st January 2012
Commission Decision 2006/770/EC amending the Annex to Regulation 1228/2003 on conditions for access to the network for cross-border exchanges in electricity	By 1st January 2012
Directive 2005/89/EC concerning measures to safeguard security of electricity supply and infrastructure investment	By 1st January 2012
Directive 85/337/EEC on the assessment of the effects of certain public and private projects on the environment, as amended by Directive 97/11/EC and Directive 2003/35/EC.	By 1st January 2013
Directive 1999/32/EC relating to a reduction in the sulphur content of certain liquid fuels	By 1st January 2012
Directive 2001/80/EC on the limitation of emissions of certain pollutants into the air from large combustion plants	By 1st January 2018
Directive 79/409/EC, Article 4(2), on the conservation of wild birds	By 1st January 2015
Plan for the implementation of Directive 2001/77/EEC on the promotion of electricity produced from renewable energy sources in the internal electricity market	By 1st July 2011
Plan for the implementation of Directive 2003/30/EC on the promotion of the use of biofuels or other renewable fuels for transport	By 1st July 2011

2. Ukraine must ensure that the eligible customers within the meaning of EC Directives 2003/15/EC and 2003/55/EC are:

- From 1 January 2012, all non-household customers; and
- From 1 January 2015, all customers.

3. In Article 19 of the Treaty, the reference “as from six months following the date of entry into force of this Treaty” shall be understood as meaning “as from six months following the date of accession of Ukraine”. In Article 22 of the Treaty, the reference “within one year of the adoption of the list” shall be understood as meaning “within one year of the date of accession of Ukraine”. In Article 29 of the Treaty, the reference “within one year of the date of entry into force of this Treaty” shall be understood as meaning “within one year of the date of accession of Ukraine”.

4. Article 15 of the Treaty shall apply to Ukraine as from two years following the date of accession of Ukraine.

### **Article 3**

1. The contribution of Ukraine and of the other Parties to the budget of the Energy Community shall be set out in a Procedural Act to be adopted pursuant to Article 73 of the Treaty. The methodology to be applied shall be based on a pro-rata calculated in relation to GDP and Total Primary Energy Supply.
2. The first contribution of Ukraine shall be due for the first full budgetary year following accession.

### **Article 4**

1. After adoption by the Ministerial Council of the Energy Community of its Decision on Ukraine's accession to the Energy Community, Ukraine shall initiate its internal procedures required for entry into force of its accession to the Energy Community.
2. The accession to the Energy Community shall enter into force on the first day of the second month following the month of completion of the procedures provided in the first paragraph of this article.

Done at Skopje, this twenty fourth day of September in the year two thousand and ten.

## PROTOCOL CONCERNING THE ACCESSION OF GEORGIA TO THE TREATY ESTABLISHING THE ENERGY COMMUNITY

The Energy Community, in accordance with the Treaty establishing the Energy Community (hereinafter - the Treaty), on the one hand,

and Georgia, on the other hand,

Taking note of the outcome of negotiations on Georgia's accession to the Energy Community,

Having regard to the Decision of the Ministerial Council of the Energy Community of 14th October 2016 approving the accession of Georgia to the Energy Community (Decision 2016/18/MC-EnC),

Considering that Georgia is not directly interconnected to the energy network of any Contracting Party or any Member State of the European Union and that specific solutions needs to be found as regards key gas transmission infrastructures mainly used for the shipment of gas through Georgia,

Considering that Georgia became an observer to the Energy Community in 2007, after the negotiation of the conditions ruling these gas transmission infrastructures,

AGREED ON THE FOLLOWING:

### **Article 1**

1. Georgia hereby accedes to the Treaty establishing the Energy Community as a Contracting Party under the terms and conditions set out in the present Protocol.
2. Unless specified otherwise in this Protocol, by date of accession, Georgia is entitled to all rights granted to Contracting Parties and is subject to all obligations imposed on Contracting Parties by the Treaty and by all Decisions and Procedural Acts adopted in application of the Treaty since its entry into force.

### **Article 2**

1. For the purpose of compliance with Title II of the Treaty establishing the Energy Community and its related Annexes, the timetable for implementation of the *acquis communautaire* is defined as follows:

Directive 2009/73/EC concerning common rules for the internal market in natural gas and repealing Directive 2003/55/EC	By 31 December 2020
Regulation (EC) No 715/2009 on conditions for access to the natural gas transmission networks and repealing Regulation (EC) No 1775/2005	By 31 December 2020

Directive 2004/67/EC concerning measures to safeguard security of natural gas supply	By 31 December 2020
Directive 2009/72/EC concerning common rules for the internal market in electricity and repealing Directive 2003/54/EC	By 31 December 2018
Regulation (EC) No 714/2009 on conditions for access to the network for cross-border exchanges in electricity and repealing Regulation (EC) No 1228/2003	By 31 December 2018
Directive 2005/89/EC concerning measures to safeguard security of electricity supply and infrastructure investment	By 31 December 2019
Directive 85/337/EEC on the assessment of the effects of certain public and private projects on the environment, as amended by Directive 97/11/EC and Directive 2003/35/EC	Without prejudice to commitments under EU-Georgia Association Agreement the entire Directive should be fully implemented by 1 September 2017.
Directive 1999/32/EC relating to a reduction in the sulphur content of certain liquid fuels	Without prejudice to commitments under EU-Georgia Association Agreement the entire Directive should be fully implemented by 1 September 2021.
Directive 2001/80/EC on the limitation of emissions of certain pollutants into the air from large combustion plants	By 31 December 2018
Chapter III, Annex V and Article 72(3)-(4) of Directive 2010/75/EU on industrial emissions (integrated pollution prevention and control) – for new plants	By 1 September 2018
Chapter III, Annex V and Article 72(3)-(4) of Directive 2010/75/EU on industrial emissions (integrated pollution prevention and control) – for existing plants	By 1 September 2026
Directive 79/409/EC, Article 4(2), on the conservation of wild birds	By 1 September 2019
Directive 2009/28/EC on the promotion of the use of energy from renewable sources and amending and subsequently repealing Directives 2001/77/EC and 2003/30/EC	By 31 December 2018
Directive 2012/27/EU on energy efficiency, amending Directives 2009/125/EC and 2010/30/EU and repealing Directives 2004/8/EC and 2006/32/EC.	By 31 December 2018
Directive 2010/30/EU on the indication by labelling and standard product information of the consumption of energy and other resources by energy-related products (recast)	By 31 December 2018
Directive 2010/31/EU on the energy performance of buildings (recast)	By 30 June 2019

Directive 2009/119/EC imposing an obligation on Member States to maintain minimum stocks of crude oil and/or petroleum products	By 1 January 2023
Directive 2008/92/EC concerning a Community procedure to improve the transparency of gas and electricity prices charged to industrial end-users (recast)	By 31 December 2017
Regulation (EC) No 1099/2008 on energy statistics	By 31 December 2017

2. Georgia must ensure that the eligible customers within the meaning of EC Directives 2009/72/EC and 2009/73/EC are:

- From 31 December 2018, all non-household customers; and
- From 31 December 2019, all customers.

3. In Article 19 of the Treaty, the reference “as from 6 months following the date of entry into force of this Treaty” shall be understood as meaning “as from one year following the date of accession of Georgia”. In Article 22 of the Treaty, the reference “within one year of the adoption of the list” shall be understood as meaning “within one year of the date of accession of Georgia”. In Article 29 of the Treaty, the reference “within one year of the date of entry into force of this Treaty” shall be understood as meaning “within one year of the date of accession of Georgia”.

4. Article 15 of the Treaty shall apply to Georgia as from one year following the date of accession of Georgia.

5. The South Caucasus Pipeline<sup>1</sup> and the North South Gas Pipeline<sup>2</sup> are exempted from the implementation of Directive 2009/73/EC and Regulation (EC) No 715/2009 until 31 August 2026, the date of expiration of the Energy Community Treaty.

6. The present protocol of accession shall not affect the Intergovernmental Agreement between Georgia and the Azerbaijan Republic relating to the transit, transportation and sale of natural gas in and beyond the territories of Georgia and the Azerbaijan Republic through the South Caucasus Pipeline System.

7. As regards implementation of the provisions of Article 2(5) and 2(6) of this Protocol it is confirmed that Georgia is exempted from the application of the Treaty in relation to legal and/or regulatory regime and/or terms and conditions of cross-border transmission (transit) of natural gas, as well as to the terms and conditions of the existing agreements concluded to implement the Intergovernmental Agreement between Georgia and the Azerbaijan Republic relating to the transit, transportation and sale of natural gas in and beyond the territories of Georgia and the Azerbaijan Republic through the South Caucasus Pipeline System.

<sup>1</sup> The South Caucasus Pipeline means SCP Project within the meaning ascribed to this term in the Intergovernmental Agreement between Georgia and the Azerbaijan Republic.

<sup>2</sup> The North-South Gas Pipeline is a part of the Georgian Main Gas Pipelines System consisting of 1200/1000 mm diameter gas pipeline sections (as may be renewed, repaired, modified, refurbished, reconstructed and/or replaced) primarily assigned for transportation of natural gas from Russian Federation to the Republic of Armenia.

8. Should the Energy Community Treaty be extended beyond the date referred to in point 5, the provisions under points 5 and 6 of the present article shall be reviewed.

### **Article 3**

1. The contribution of Georgia and of the other Parties to the budget of the Energy Community shall be set out in a Procedural Act to be adopted pursuant to Article 73 of the Treaty. The methodology to be applied shall be based on a pro-rata calculated in relation to GDP and Total Primary Energy Supply.

2. The first contribution of Georgia shall be due for the first full budgetary year following accession.

### **Article 4**

1. After adoption by the Ministerial Council of the Energy Community of its Decision on Georgia's accession to the Treaty establishing the Energy Community, Georgia shall initiate its internal procedures required for entry into force of its accession to the Energy Community.

2. The accession to the Energy Community shall enter into force on the first day of the second month following the month of completion of the procedures provided in the first paragraph of this article. Notification thereof shall be sent to the Secretary General of the Council of the European Union, who shall be the depositary for this Protocol.

Done in Sarajevo, 14th October 2016

For the Energy Community    For Georgia

## ANNEX

### COMMON UNDERSTANDING CONCERNING THE IMPLEMENTATION OF THE PROTOCOL

1. As regards the provisions included in the *acquis communautaire* listed under articles 2(1) and 2(2) of the protocol concerning energy cross-border exchanges with a Contracting Party or a Member State of the European Union, it shall be taken into account that Georgia is not directly interconnected to the energy network of any Contracting Party or Member State of the European Union. Georgia will start applying these rules and principles with respect to any Contracting Party or Member State of the European Union whenever it is physically interconnected to the energy network of any Contracting Party or Member State of the European Union. Rules and principles governing trade with countries which are not a Contracting Party of the Energy Community or a Member State of the European Union remains a national competence.

2. Any application of the provisions of the Chapter IV in Title II the Treaty (the *acquis* on competition) shall take into account that Georgia is currently an isolated market not having direct interconnections to the energy network of any Party. Georgia will promote and apply these provisions insofar as trade between the Contracting Parties may be affected.

3. For the implementation of Directive 2009/72/EC concerning common rules for the internal market in electricity, to be completed by 31 December 2018 and Directive 2005/89/EC concerning measures to safeguard security of electricity supply and infrastructure investment, to be completed by 31 December 2019, it is understood that a subsequent period of one year will be necessary for testing and adjusting the relevant implementing provisions and market instruments.

4. For the setting and level of electricity distribution tariffs, it is understood that Georgia may continue to observe its commitments with investors resulting from contracts concluded before the signature of this Protocol. It will engage in discussions with the Secretariat aimed at eliminating potential incompatibilities with the Treaty, no later than Article 2(1) and 2(2) become applicable.

5. Within the scope of Directive 2009/28/EC on the promotion of the use of energy from renewable sources, the applicability and, if appropriate, the calculation of the 2020 renewable energy target for Georgia will be established after the completion of the study appositely carried out under the responsibility of the Energy Community Secretariat.

6. With regard to Directives 2001/80/EC, 2012/27/EU, 2009/28/EC, 2010/30/EU, and 2010/31/EU, a number of specific deadlines differing from the overall Directives deadlines have been adapted by the Ministerial Council Decisions 2015/08/MC-EnC, 2013/05/MC-EnC, 2012/04/MC-EnC, 2014/02/MC-EnC and 2010/02/MC-EnC. In these specific cases, Georgia shall be granted the same adapted timeframe for implementation following the logic of the adaptations made for the existing Contracting Parties plus an additional period of 12 months. Within one month after signature of this Protocol, the Secretariat shall compile the deadlines applicable to Georgia under these Directives in a table for clarification.

---

## **PART II**

ACQUIS COMMUNAUTAIRE

ELECTRICITY

## **DIRECTIVE 2009/72/EC of 13 July 2009 concerning common rules for the internal market in electricity and repealing Directive 2003/54/EC**

Incorporated and adapted by Ministerial Council Decision 2011/02/MC-EnC of 6 October 2011 on the implementation of Directive 2009/72/EC, Directive 2009/73/EC, Regulation (EC) 714/2009 and Regulation (EC) 715/2009 and amending Articles 11 and 59 of the Energy Community Treaty.

*The adaptations made by Ministerial Council Decision 2011/02/MC-EnC are highlighted in **bold and blue**.*

Whereas:

(1) The internal market in electricity, which has been progressively implemented throughout the Community since 1999, aims to deliver real choice for all consumers of the European Union, be they citizens or businesses, new business opportunities and more cross-border trade, so as to achieve efficiency gains, competitive prices, and higher standards of service, and to contribute to security of supply and sustainability.

(2) Directive 2003/54/EC of the European Parliament and of the Council of 26 June 2003 concerning common rules for the internal market in electricity has made a significant contribution towards the creation of such an internal market in electricity.

(3) The freedoms which the Treaty guarantees the citizens of the Union - *inter alia*, the free movement of goods, the freedom of establishment and the freedom to provide services - are achievable only in a fully open market, which enables all consumers freely to choose their suppliers and all suppliers freely to deliver to their customers.

(4) However, at present, there are obstacles to the sale of electricity on equal terms and without discrimination or disadvantages in the Community. In particular, non-discriminatory network access and an equally effective level of regulatory supervision in each Member State do not yet exist.

(5) A secure supply of electricity is of vital importance for the development of European society, the implementation of a sustainable climate change policy, and the fostering of competitiveness within the internal market. To that end, cross-border interconnections should be further developed in order to secure the supply of all energy sources at the most competitive prices to consumers and industry within the Community.

(6) A well-functioning internal market in electricity should provide producers with the appropriate incentives for investing in new power generation, including in electricity from renewable energy sources, paying special attention to the most isolated countries and regions in the Community's energy market. A well-functioning market should also provide consumers with adequate measures to promote the more efficient use of energy for which a secure supply of energy is a precondition.

(7) The Communication of the Commission of 10 January 2007 entitled "An Energy Policy for Europe" highlighted the importance of completing the internal market in electricity and of creating a level playing field for all electricity undertakings established in the Community. The Communications of the Commission of 10 January 2007 entitled "Prospects for the internal gas and electricity market" and "Inquiry pursuant to Article 17 of Regulation (EC) No 1/2003 into the European gas and electricity sectors (Final Report)" showed that the present rules and measures do not provide the necessary framework for achieving the objective of a well-functioning internal market.

(8) In order to secure competition and the supply of electricity at the most competitive price, Member States and national regulatory authorities should facilitate cross-border access for new suppliers of electricity from different energy sources as well as for new providers of power generation.

(9) Without effective separation of networks from activities of generation and supply (effective unbundling), there is an inherent risk of discrimination not only in the operation of the network but also in the incentives for vertically integrated undertakings to invest adequately in their networks.

(10) The rules on legal and functional unbundling as provided for in Directive 2003/54/EC have not, however, led to effective unbundling of the transmission system operators. At its meeting on 8 and 9 March 2007, the European Council therefore invited the Commission to develop legislative proposals for the “effective separation of supply and generation activities from network operations”.

(11) Only the removal of the incentive for vertically integrated undertakings to discriminate against competitors as regards network access and investment can ensure effective unbundling. Ownership unbundling, which implies the appointment of the network owner as the system operator and its independence from any supply and production interests, is clearly an effective and stable way to solve the inherent conflict of interests and to ensure security of supply. For that reason, the European Parliament, in its resolution of 10 July 2007 on prospects for the internal gas and electricity market referred to ownership unbundling at transmission level as the most effective tool by which to promote investments in infrastructure in a non-discriminatory way, fair access to the network for new entrants and transparency in the market. Under ownership unbundling, Member States should therefore be required to ensure that the same person or persons are not entitled to exercise control over a generation or supply undertaking and, at the same time, exercise control or any right over a transmission system operator or transmission system. Conversely, control over a transmission system or transmission system operator should preclude the possibility of exercising control or any right over a generation or supply undertaking. Within those limits, a generation or supply undertaking should be able to have a minority shareholding in a transmission system operator or transmission system.

(12) Any system for unbundling should be effective in removing any conflict of interests between producers, suppliers and transmission system operators, in order to create incentives for the necessary investments and guarantee the access of new market entrants under a transparent and efficient regulatory regime and should not create an overly onerous regulatory regime for national regulatory authorities.

(13) The definition of the term “control” is taken from Council Regulation (EC) No 139/2004 of 20 January 2004 on the control of concentrations between undertakings (the EC Merger Regulation).

(14) Since ownership unbundling requires, in some instances, the restructuring of undertakings, Member States that decide to implement ownership unbundling should be granted additional time to apply the relevant provisions. In view of the vertical links between the electricity and gas sectors, the unbundling provisions should apply across the two sectors.

(15) Under ownership unbundling, to ensure full independence of network operation from supply and generation interests and to prevent exchanges of any confidential information, the same person should not be a member of the managing boards of both a transmission system operator or a transmission system and an undertaking performing any of the functions of generation or supply. For the same reason, the same person should not be entitled to appoint members of the managing boards of a transmission system operator or a transmission system and to exercise control or any right over a generation or supply undertaking.

(16) The setting up of a system operator or a transmission operator that is independent from supply and generation interests should enable a vertically integrated undertaking to maintain its ownership of network assets whilst ensuring effective separation of interests, provided that such independent system operator or such independent transmission operator performs all the functions of a system operator and detailed regulation and extensive regulatory control mechanisms are put in place.

(17) Where, on 3 September 2009, an undertaking owning a transmission system is part of a vertically integrated undertaking, Member States should therefore be given a choice between ownership unbundling and setting up a system operator or transmission operator which is independent from supply and generation interests.

(18) To preserve fully the interests of the shareholders of vertically integrated undertakings, Member States should have the choice of implementing ownership unbundling either by direct divestiture or by splitting the shares of the integrated undertaking into shares of the network undertaking and shares of the remaining supply and generation undertaking, provided that the requirements resulting from ownership unbundling are complied with.

(19) The full effectiveness of the independent system operator or independent transmission operator solutions should be ensured by way of specific additional rules. The rules on the independent transmission operator provide an appropriate regulatory framework to guarantee fair competition, sufficient investment, access for new market entrants and the integration of electricity markets. Effective unbundling through the independent transmission operator provisions should be based on a pillar of organisational measures and measures relating to the governance of transmission system operators and on a pillar of measures relating to investment, connecting new production capacities to the network and market integration through regional cooperation. The independence of the transmission operator should also, *inter alia*, be ensured through certain “cooling-off” periods during which no management or other relevant activity giving access to the same information as could have been obtained in a managerial position is exercised in the vertically integrated undertaking. The independent transmission operator model of effective unbundling is in line with the requirements laid down by the European Council at its meeting on 8 and 9 March 2007.

(20) In order to develop competition in the internal market in electricity, large non-household customers should be able to choose their suppliers and enter into contracts with several suppliers to secure their electricity requirements. Such customers should be protected against exclusivity clauses the effect of which is to exclude competing or complementary offers.

(21) A Member State has the right to opt for full ownership unbundling in its territory. Where a Member State has exercised that right, an undertaking does not have the right to set up an independent system operator or an independent transmission operator. Furthermore, an undertaking performing any of the functions of generation or supply cannot directly or indirectly exercise control or any right over a transmission system operator from a Member State that has opted for full ownership unbundling.

(22) Under this Directive different types of market organisation will exist in the internal market in electricity. The measures that Member States could take in order to ensure a level playing field should be based on overriding requirements of general interest. The Commission should be consulted on the compatibility of the measures with the Treaty and Community law.

(23) The implementation of effective unbundling should respect the principle of non-discrimination between the public and private sectors. To that end, the same person should not be able to exercise

control or any right, in violation of the rules of ownership unbundling or the independent system operator option, solely or jointly, over the composition, voting or decision of the bodies of both the transmission system operators or the transmission systems and the generation or supply undertakings. With regard to ownership unbundling and the independent system operator solution, provided that the Member State in question is able to demonstrate that the requirement is complied with, two separate public bodies should be able to control generation and supply activities on the one hand and transmission activities on the other.

(24) Fully effective separation of network activities from supply and generation activities should apply throughout the Community to both Community and non-Community undertakings. To ensure that network activities and supply and generation activities throughout the Community remain independent from each other, regulatory authorities should be empowered to refuse certification to transmission system operators that do not comply with the unbundling rules. To ensure the consistent application of those rules across the Community, the regulatory authorities should take utmost account of the Commission's opinion when the former take decisions on certification. To ensure, in addition, respect for the international obligations of the Community, and solidarity and energy security within the Community, the Commission should have the right to give an opinion on certification in relation to a transmission system owner or a transmission system operator which is controlled by a person or persons from a third country or third countries.

(25) The security of energy supply is an essential element of public security and is therefore inherently connected to the efficient functioning of the internal market in electricity and the integration of the isolated electricity markets of Member States. Electricity can reach the citizens of the Union only through the network. Functioning electricity markets and, in particular, the networks and other assets associated with electricity supply are essential for public security, for the competitiveness of the economy and for the well-being of the citizens of the Union. Persons from third countries should therefore be allowed to control a transmission system or a transmission system operator only if they comply with the requirements of effective separation that apply inside the Community. Without prejudice to the international obligations of the Community, the Community considers that the electricity transmission system sector is of high importance to the Community and therefore additional safeguards are necessary regarding the preservation of the security of supply of energy to the Community to avoid any threats to public order and public security in the Community and the welfare of the citizens of the Union. The security of supply of energy to the Community requires, in particular, an assessment of the independence of network operation, the level of the Community's and individual Member States' dependence on energy supply from third countries, and the treatment of both domestic and foreign trade and investment in energy in a particular third country. Security of supply should therefore be assessed in the light of the factual circumstances of each case as well as the rights and obligations arising under international law, in particular the international agreements between the Community and the third country concerned. Where appropriate the Commission is encouraged to submit recommendations to negotiate relevant agreements with third countries addressing the security of supply of energy to the Community or to include the necessary issues in other negotiations with those third countries.

(26) Non-discriminatory access to the distribution network determines downstream access to customers at retail level. The scope for discrimination as regards third-party access and investment, however, is less significant at distribution level than at transmission level where congestion and the influence of generation or supply interests are generally greater than at distribution level. Moreover,

legal and functional unbundling of distribution system operators was required, pursuant to Directive 2003/54/EC, only from 1 July 2007 and its effects on the internal market in electricity still need to be evaluated. The rules on legal and functional unbundling currently in place can lead to effective unbundling provided they are more clearly defined, properly implemented and closely monitored. To create a level playing field at retail level, the activities of distribution system operators should therefore be monitored so that they are prevented from taking advantage of their vertical integration as regards their competitive position on the market, in particular in relation to household and small non-household customers.

(27) Member States should encourage the modernisation of distribution networks, such as through the introduction of smart grids, which should be built in a way that encourages decentralised generation and energy efficiency.

(28) In the case of small systems it may be necessary that the provision of ancillary services is ensured by transmission system operators interconnected with small systems.

(29) To avoid imposing a disproportionate financial and administrative burden on small distribution system operators, Member States should be able, where necessary, to exempt the undertakings concerned from the legal distribution unbundling requirements.

(30) Where a closed distribution system is used to ensure the optimal efficiency of an integrated energy supply requiring specific operational standards, or a closed distribution system is maintained primarily for the use of the owner of the system, it should be possible to exempt the distribution system operator from obligations which would constitute an unnecessary administrative burden because of the particular nature of the relationship between the distribution system operator and the users of the system. Industrial, commercial or shared services sites such as train station buildings, airports, hospitals, large camping sites with integrated facilities or chemical industry sites can include closed distribution systems because of the specialised nature of their operations.

(31) Authorisation procedures should not lead to an administrative burden disproportionate to the size and potential impact of electricity producers. Unduly lengthy authorisation procedures may constitute a barrier to access for new market entrants.

(32) Further measures should be taken in order to ensure transparent and non-discriminatory tariffs for access to networks. Those tariffs should be applicable to all system users on a non-discriminatory basis.

(33) Directive 2003/54/EC introduced a requirement for Member States to establish regulators with specific competences. However, experience shows that the effectiveness of regulation is frequently hampered through a lack of independence of regulators from government, and insufficient powers and discretion. For that reason, at its meeting on 8 and 9 March 2007, the European Council invited the Commission to develop legislative proposals providing for further harmonisation of the powers and strengthening of the independence of national energy regulators. It should be possible for those national regulatory authorities to cover both the electricity and the gas sectors.

(34) Energy regulators need to be able to take decisions in relation to all relevant regulatory issues if the internal market in electricity is to function properly, and to be fully independent from any other public or private interests. This precludes neither judicial review nor parliamentary supervision in accordance with the constitutional laws of the Member States. In addition, approval of the budget of the regulator by the national legislator does not constitute an obstacle to budgetary autonomy. The provisions relating to the autonomy in the implementation of the allocated budget of the regulatory

authority should be implemented in the framework defined by national budgetary law and rules. While contributing to the independence of the national regulatory authority from any political or economic interest through an appropriate rotation scheme, it should be possible for Member States to take due account of the availability of human resources and of the size of the board.

(35) In order to ensure effective market access for all market players, including new entrants, non-discriminatory and cost-reflective balancing mechanisms are necessary. As soon as the electricity market is sufficiently liquid, this should be achieved through the setting up of transparent market-based mechanisms for the supply and purchase of electricity, needed in the framework of balancing requirements. In the absence of such a liquid market, national regulatory authorities should play an active role to ensure that balancing tariffs are non-discriminatory and cost-reflective. At the same time, appropriate incentives should be provided to balance the in-put and off-take of electricity and not to endanger the system. Transmission system operators should facilitate participation of final customers and final customers' aggregators in reserve and balancing markets.

(36) National regulatory authorities should be able to fix or approve tariffs, or the methodologies underlying the calculation of the tariffs, on the basis of a proposal by the transmission system operator or distribution system operator(s), or on the basis of a proposal agreed between those operator(s) and the users of the network. In carrying out those tasks, national regulatory authorities should ensure that transmission and distribution tariffs are non-discriminatory and cost-reflective, and should take account of the long-term, marginal, avoided network costs from distributed generation and demand-side management measures.

(37) Energy regulators should have the power to issue binding decisions in relation to electricity undertakings and to impose effective, proportionate and dissuasive penalties on electricity undertakings which fail to comply with their obligations or to propose that a competent court impose such penalties on them. Energy regulators should also be granted the power to decide, irrespective of the application of competition rules, on appropriate measures ensuring customer benefits through the promotion of effective competition necessary for the proper functioning of the internal market in electricity. The establishment of virtual power plants - electricity release programmes whereby electricity undertakings are obliged to sell or to make available a certain volume of electricity or to grant access to part of their generation capacity to interested suppliers for a certain period of time - is one of the possible measures that can be used to promote effective competition and ensure the proper functioning of the market. Energy regulators should also be granted the power to contribute to ensuring high standards of universal and public service in compliance with market opening, to the protection of vulnerable customers, and to the full effectiveness of consumer protection measures. Those provisions should be without prejudice to both the Commission's powers concerning the application of competition rules including the examination of mergers with a Community dimension, and the rules on the internal market such as the free movement of capital. The independent body to which a party affected by the decision of a national regulator has a right to appeal could be a court or other tribunal empowered to conduct a judicial review.

(38) Any harmonisation of the powers of national regulatory authorities should include the powers to provide incentives to electricity undertakings, and to impose effective, proportionate and dissuasive penalties on electricity undertakings or to propose that a competent court impose such penalties. Moreover, regulatory authorities should have the power to request relevant information from electricity undertakings, make appropriate and sufficient investigations and settle disputes.

(39) The internal market in electricity suffers from a lack of liquidity and transparency hindering

the efficient allocation of resources, risk hedging and new entry. There is a need for enhancement of competition and security of supply through facilitated integration of new power plants into the electricity network in all Member States, in particular encouraging new market entrants. Trust in the market, its liquidity and the number of market participants needs to increase, and, therefore, regulatory oversight of undertakings active in the supply of electricity needs to be increased. Such requirements should be without prejudice to, and compatible with, existing Community law in relation to the financial markets. Energy regulators and financial market regulators need to cooperate in order to enable each other to have an overview over the markets concerned.

(40) Prior to the adoption by the Commission of Guidelines defining further the record-keeping requirements, the Agency for the Cooperation of Energy Regulators established by Regulation (EC) No 713/2009 of the European Parliament and of the Council of 13 July 2009 establishing an Agency for the Cooperation of Energy Regulators (the "Agency"), and the Committee of European Securities Regulators (the "CESR"), established by Commission Decision 2009/77/EC, should confer and advise the Commission in regard to their content. The Agency and the CESR should also cooperate to investigate further and advise on whether transactions in electricity supply contracts and electricity derivatives should be subject to pre- or post-trade transparency requirements and, if so, what the content of those requirements should be.

(41) Member States or, where a Member State has so provided, the regulatory authority, should encourage the development of interruptible supply contracts.

(42) All Community industry and commerce, including small and medium-sized enterprises, and all citizens of the Union that enjoy the economic benefits of the internal market should also be able to enjoy high levels of consumer protection, and in particular household customers and, where Member States deem it appropriate, small enterprises should also be able to enjoy public service guarantees, in particular with regard to security of supply and reasonable tariffs, for reasons of fairness, competitiveness and, indirectly, to create employment. Those customers should also have access to choice, fairness, representation and dispute settlement mechanisms.

(43) Nearly all Member States have chosen to ensure competition in the electricity generation market through a transparent authorisation procedure. However, Member States should ensure the possibility to contribute to security of supply through the launching of a tendering procedure or an equivalent procedure in the event that sufficient electricity generation capacity is not built on the basis of the authorisation procedure. Member States should have the possibility, in the interests of environmental protection and the promotion of new infant technologies, of tendering for new capacity on the basis of published criteria. Such new capacity includes, *inter alia*, electricity from renewable energy sources and combined heat and power.

(44) In the interests of security of supply, the balance between supply and demand in individual Member States should be monitored, and such monitoring should be followed by a report on the situation at Community level, taking account of interconnection capacity between areas. Such monitoring should be carried out sufficiently early to enable appropriate measures to be taken if security of supply is compromised. The construction and maintenance of the necessary network infrastructure, including interconnection capacity, should contribute to ensuring a stable electricity supply. The maintenance and construction of the necessary network infrastructure, including interconnection capacity and decentralised electricity generation, are important elements in ensuring a stable electricity supply.

(45) Member States should ensure that household customers and, where Member States deem it appropriate, small enterprises, enjoy the right to be supplied with electricity of a specified quality at clearly comparable, transparent and reasonable prices. In order to ensure the maintenance of the high standards of public service in the Community, all measures taken by Member States to achieve the objective of this Directive should be regularly notified to the Commission. The Commission should regularly publish a report analysing measures taken at national level to achieve public service objectives and comparing their effectiveness, with a view to making recommendations as regards measures to be taken at national level to achieve high public service standards. Member States should take the necessary measures to protect vulnerable customers in the context of the internal market in electricity. Such measures may differ according to the particular circumstances in the Member States in question and may include specific measures relating to the payment of electricity bills, or more general measures taken in the social security system. Where universal service is also provided to small enterprises, measures to ensure that such universal service is provided may differ according to whether they are aimed at household customers or small enterprises.

(46) Respect for the public service requirements is a fundamental requirement of this Directive, and it is important that common minimum standards, respected by all Member States, are specified in this Directive, which take into account the objectives of consumer protection, security of supply, environmental protection and equivalent levels of competition in all Member States. It is important that the public service requirements can be interpreted on a national basis, taking into account national circumstances and subject to the respect of Community law.

(47) It should be possible for Member States to appoint a supplier of last resort. That supplier may be the sales division of a vertically integrated undertaking, which also performs the functions of distribution, provided that it meets the unbundling requirements of this Directive.

(48) It should be possible for measures implemented by Member States to achieve the objectives of social and economic cohesion to include, in particular, the provision of adequate economic incentives, using, where appropriate, all existing national and Community tools. Such tools may include liability mechanisms to guarantee the necessary investment.

(49) To the extent to which measures taken by Member States to fulfil public service obligations constitute State aid under Article 87(1) of the Treaty, there is an obligation under Article 88(3) of the Treaty to notify them to the Commission.

(50) The public service requirements, including as regards the universal service, and the common minimum standards that follow from them need to be further strengthened to make sure that all consumers, especially vulnerable ones, are able to benefit from competition and fair prices. The public service requirements should be defined at national level, taking into account national circumstances; Community law should, however, be respected by the Member States. The citizens of the Union and, where Member States deem it appropriate, small enterprises, should be able to enjoy public service obligations, in particular with regard to security of supply, and reasonable prices. A key aspect of supplying customers is access to objective and transparent consumption data. Thus, consumers should have access to their consumption data and associated prices and services costs so that they can invite competitors to make an offer based on those data. Consumers should also have the right to be properly informed about their energy consumption. Prepayments should reflect the likely consumption of electricity and different payment systems should be non-discriminatory. Information on energy costs provided to consumers frequently enough will create incentives for energy savings because it will give customers direct feedback on the effects of investment in energy efficiency and

change of behaviour. In this respect, full implementation of Directive 2006/32/EC of the European Parliament and of the Council of 5 April 2006 on energy end-use efficiency and energy services will help consumers to reduce their energy costs.

(51) Consumer interests should be at the heart of this Directive and quality of service should be a central responsibility of electricity undertakings. Existing rights of consumers need to be strengthened and guaranteed, and should include greater transparency. Consumer protection should ensure that all consumers in the wider remit of the Community benefit from a competitive market. Consumer rights should be enforced by Member States or, where a Member State has so provided, the regulatory authorities.

(52) Clear and comprehensible information should be made available to consumers concerning their rights in relation to the energy sector. The Commission should establish, after consulting relevant stakeholders including Member States, national regulatory authorities, consumer organisations and electricity undertakings, an accessible, user-friendly energy consumer checklist providing consumers with practical information about their rights. That checklist should be provided to all consumers and should be made publicly available.

(53) Energy poverty is a growing problem in the Community. Member States which are affected and which have not yet done so should therefore develop national action plans or other appropriate frameworks to tackle energy poverty, aiming at decreasing the number of people suffering such situation. In any event, Member States should ensure the necessary energy supply for vulnerable customers. In doing so, an integrated approach, such as in the framework of social policy, could be used and measures could include social policies or energy efficiency improvements for housing. At the very least, this Directive should allow national policies in favour of vulnerable customers.

(54) Greater consumer protection is guaranteed by the availability of effective means of dispute settlement for all consumers. Member States should introduce speedy and effective complaint handling procedures.

(55) It should be possible to base the introduction of intelligent metering systems on an economic assessment. Should that assessment conclude that the introduction of such metering systems is economically reasonable and cost-effective only for consumers with a certain amount of electricity consumption, Member States should be able to take this into account when implementing intelligent metering systems.

(56) Market prices should give the right incentives for the development of the network and for investing in new electricity generation.

(57) Promoting fair competition and easy access for different suppliers and fostering capacity for new electricity generation should be of the utmost importance for Member States in order to allow consumers to take full advantage of the opportunities of a liberalised internal market in electricity.

(58) With a view to creating an internal market in electricity, Member States should foster the integration of their national markets and the cooperation of system operators at Community and regional level, also incorporating isolated systems forming electricity islands that persist in the Community.

(59) The development of a true internal market in electricity, through a network connected across the Community, should be one of the main goals of this Directive and regulatory issues on cross-border interconnections and regional markets should, therefore, be one of the main tasks of the regulatory authorities, in close cooperation with the Agency where relevant.

(60) Securing common rules for a true internal market and a broad supply of electricity accessible to all should also be one of the main goals of this Directive. To that end, undistorted market prices would provide an incentive for cross-border interconnections and for investments in new power generation while leading, in the long term, to price convergence.

(61) Regulatory authorities should also provide information on the market to permit the Commission to exercise its role of observing and monitoring the internal market in electricity and its short, medium and long-term evolution, including aspects such as generation capacity, different sources of electricity generation, transmission and distribution infrastructure, quality of service, cross-border trade, congestion management, investments, wholesale and consumer prices, market liquidity and environmental and efficiency improvements. National regulatory authorities should report to the competition authorities and the Commission those Member States in which prices impair competition and proper functioning of the market.

(62) Since the objective of this Directive, namely the creation of a fully operational internal electricity market, cannot be sufficiently achieved by the Member States and can therefore be better achieved at Community level, the Community may adopt measures, in accordance with the principle of subsidiarity as set out in Article 5 of the Treaty. In accordance with the principle of proportionality, as set out in that Article, this Directive does not go beyond what is necessary in order to achieve that objective.

(63) Under Regulation (EC) No 714/2009 of the European Parliament and of the Council of 13 July 2009 on conditions for access to the network for cross-border exchanges in electricity, the Commission may adopt Guidelines to achieve the necessary degree of harmonisation. Such Guidelines, which constitute binding implementing measures, are, also with regard to certain provisions of this Directive, a useful tool which can be adapted quickly where necessary.

(64) The measures necessary for the implementation of this Directive should be adopted in accordance with Council Decision 1999/468/EC of 28 June 1999 laying down the procedures for the exercise of implementing powers conferred on the Commission.

(65) In particular, the Commission should be empowered to adopt the Guidelines necessary for providing the minimum degree of harmonisation required to achieve the aim of this Directive. Since those measures are of general scope and are designed to amend non-essential elements of this Directive, by supplementing it with new non-essential elements, they must be adopted in accordance with the regulatory procedure with scrutiny provided for in Article 5a of Decision 1999/468/EC.

(66) In accordance with point 34 of the Interinstitutional Agreement on better law-making, Member States are encouraged to draw up, for themselves and in the interest of the Community, their own tables, illustrating, as far as possible, the correlation between this Directive and the transposition measures, and to make them public.

(67) Given the scope of the amendments made to Directive 2003/54/EC herein, it is desirable, for reasons of clarity and rationalisation, that the provisions in question should be recast by bringing them all together in a single text in a new Directive.

(68) This Directive respects the fundamental rights, and observes the principles, recognised in particular by the Charter of Fundamental Rights of the European Union.

## CHAPTER I

### SUBJECT MATTER, SCOPE AND DEFINITIONS

#### *Article 1*

##### **Subject matter and scope**

This Directive establishes common rules for the generation, transmission, distribution and supply of electricity, of electricity, together with consumer protection provisions, with a view to improving and integrating competitive electricity markets in the **Energy Community**. It lays down the rules relating to the organization and functioning of the electricity sector, open access to the market, the criteria and procedures applicable to calls for tenders and the granting of authorizations and the operation of systems. It also lays down universal service obligations and the rights of electricity consumers and clarifies competition requirements.

#### *Article 2*

##### **Definitions**

For the purposes of this Directive, the following definitions apply:

1. "generation" means the production of electricity;
2. "producer" means a natural or legal person generating electricity;
3. "transmission" means the transport of electricity on the extra high-voltage and high-voltage interconnected system with a view to its delivery to final customers or to distributors, but does not include supply;
4. "transmission system operator" means a natural or legal person responsible for operating, ensuring the maintenance of and, if necessary, developing the transmission system in a given area and, where applicable, its interconnections with other systems, and for ensuring the long-term ability of the system to meet reasonable demands for the transmission of electricity;
5. "distribution" means the transport of electricity on high-voltage, medium-voltage and low-voltage distribution systems with a view to its delivery to customers, but does not include supply;
6. "distribution system operator" means a natural or legal person responsible for operating, ensuring the maintenance of and, if necessary, developing the distribution system in a given area and, where applicable, its interconnections with other systems and for ensuring the long-term ability of the system to meet reasonable demands for the distribution of electricity;
7. "customer" means a wholesale or final customer of electricity;
8. "wholesale customer" means a natural or legal person purchasing electricity for the purpose of resale inside or outside the system where he is established;
9. "final customer" means a customer purchasing electricity for his own use;
10. "household customer" means a customer purchasing electricity for his own household consumption, excluding commercial or professional activities;

11. "non-household customer" means a natural or legal persons purchasing electricity which is not for their own household use and includes producers and wholesale customers;
12. "eligible customer" means a customer who is free to purchase electricity from the supplier of his choice within the meaning of Article 33;
13. "interconnector" means equipment used to link electricity systems;
14. "interconnected system" means a number of transmission and distribution systems linked together by means of one or more interconnectors;
15. "direct line" means either an electricity line linking an isolated generation site with an isolated customer or an electricity line linking an electricity producer and an electricity supply undertaking to supply directly their own premises, subsidiaries and eligible customers;
16. "economic precedence" means the ranking of sources of electricity supply in accordance with economic criteria;
17. "ancillary service" means a service necessary for the operation of a transmission or distribution system;
18. "system user" means a natural or legal person supplying to, or being supplied by, a transmission or distribution system;
19. "supply" means the sale, including resale, of electricity to customers;
20. "integrated electricity undertaking" means a vertically or horizontally integrated undertaking;
21. "vertically integrated undertaking" means an electricity undertaking or a group of electricity undertakings where the same person or the same persons are entitled, directly or indirectly, to exercise control, and where the undertaking or group of undertakings perform at least one of the functions of transmission or distribution, and at least one of the functions of generation or supply of electricity;
22. "related undertaking" means affiliated undertakings, within the meaning of Article 41 of the Seventh Council Directive 83/349/EEC of 13 June 1983 based on Article 44(2)(g) of the Treaty on consolidated accounts, and/or associated undertakings, within the meaning of Article 33(1) of that Directive, and/or undertakings which belong to the same shareholders;
23. "horizontally integrated undertaking" means an undertaking performing at least one of the functions of generation for sale, or transmission, or distribution, or supply of electricity, and another non-electricity activity;
24. "tendering procedure" means the procedure through which planned additional requirements and replacement capacity are covered by supplies from new or existing generating capacity;
25. "long-term planning" means the planning of the need for investment in generation and transmission and distribution capacity on a long-term basis, with a view to meeting the demand of the system for electricity and securing supplies to customers;
26. "small isolated system" means any system with consumption of less than 3000 GWh in the year **2006**, where less than 5% of annual consumption is obtained through interconnection with other systems;
27. "micro isolated system" means any system with consumption less than 500 GWh in the year **2006**, where there is no connection with other systems;
28. "security" means both security of supply and provision of electricity, and technical safety;
29. "energy efficiency/demand-side management" means a global or integrated approach aimed

at influencing the amount and timing of electricity consumption in order to reduce primary energy consumption and peak loads by giving precedence to investments in energy efficiency measures, or other measures, such as interruptible supply contracts, over investments to increase generation capacity, if the former are the most effective and economical option, taking into account the positive environmental impact of reduced energy consumption and the security of supply and distribution cost aspects related to it;

30. “renewable energy sources” means renewable non-fossil energy sources (wind, solar, geothermal, wave, tidal, hydropower, biomass, landfill gas, sewage treatment plant gas and biogases);

31. “distributed generation” means generation plants connected to the distribution system;

32. “electricity supply contract” means a contract for the supply of electricity, but does not include an electricity derivative;

33. “electricity derivative” means a financial instrument specified in points 5, 6 or 7 of Section C of Annex I to Directive 2004/39/EC of the European Parliament and of the Council of 21 April 2004 on markets in financial instruments, where that instrument relates to electricity;

34. “control” means rights, contracts or any other means which, either separately or in combination and having regard to the considerations of fact or law involved, confer the possibility of exercising decisive influence on an undertaking, in particular by:

(a) ownership or the right to use all or part of the assets of an undertaking;

(b) rights or contracts which confer decisive influence on the composition, voting or decisions of the organs of an undertaking;

35. “electricity undertaking” means any natural or legal person carrying out at least one of the following functions: generation, transmission, distribution, supply, or purchase of electricity, which is responsible for the commercial, technical or maintenance tasks related to those functions, but does not include final customers.

## CHAPTER II

### GENERAL RULES FOR THE ORGANISATION OF THE SECTOR

#### *Article 3*

#### **Public service obligations and customer protection**

1. **Contracting Parties** shall ensure, on the basis of their institutional organisation and with due regard to the principle of subsidiarity, that, without prejudice to paragraph 2, electricity undertakings are operated in accordance with the principles of this Directive with a view to achieving a competitive, secure and environmentally sustainable market in electricity, and shall not discriminate between those undertakings as regards either rights or obligations.

2. Having full regard to the relevant provisions of the **Energy Community Treaty, in particular Annex III thereof, Contracting Parties** may impose on undertakings operating in the electricity sector, in the general economic interest, public service obligations which may relate to security, including security of supply, regularity, quality and price of supplies and environmental protection, including energy efficiency, energy from renewable sources and climate protection. Such obligations

shall be clearly defined, transparent, non-discriminatory, verifiable and shall guarantee equality of access for electricity undertakings of the **Energy Community** to national consumers. In relation to security of supply, energy efficiency/demand-side management and for the fulfilment of environmental goals and goals for energy from renewable sources, as referred to in this paragraph, **Contracting Parties** may introduce the implementation of long-term planning, taking into account the possibility of third parties seeking access to the system.

3. **Contracting Parties** shall ensure that all household customers, and, where **Contracting Parties** deem it appropriate, small enterprises (namely enterprises with fewer than 50 occupied persons and an annual turnover or balance sheet not exceeding EUR 10 million), enjoy universal service, that is the right to be supplied with electricity of a specified quality within their territory at reasonable, easily and clearly comparable, transparent and non-discriminatory prices. To ensure the provision of universal service, **Contracting Parties** may appoint a supplier of last resort. **Contracting Parties** shall impose on distribution companies an obligation to connect customers to their network under terms, conditions and tariffs set in accordance with the procedure laid down in Article 37(6). Nothing in this Directive shall prevent **Contracting Parties** from strengthening the market position of the household, small and medium-sized consumers by promoting the possibilities of voluntary aggregation of representation for that class of consumers.

The first subparagraph shall be implemented in a transparent and non-discriminatory way and shall not impede the opening of the market provided for in Article 33.

4. **Contracting Parties** shall ensure that all customers are entitled to have their electricity provided by a supplier, subject to the supplier's agreement, regardless of the **Contracting Party** in which the supplier is registered, as long as the supplier follows the applicable trading and balancing rules. In this regard, **Contracting Parties** shall take all measures necessary to ensure that administrative procedures do not discriminate against supply undertakings already registered in another **Contracting Party**.

5. **Contracting Parties** shall ensure that:

- (a) where a customer, while respecting contractual conditions, wishes to change supplier, the change is effected by the operator(s) concerned within three weeks; and
- (b) customers are entitled to receive all relevant consumption data.

**Contracting Parties** shall ensure that the rights referred to in points (a) and (b) are granted to customers in a non-discriminatory manner as regards cost, effort or time.

6. Where financial compensation, other forms of compensation and exclusive rights which a **Contracting Party** grants for the fulfilment of the obligations set out in paragraphs 2 and 3 are provided, this shall be done in a non-discriminatory and transparent way.

7. **Contracting Parties** shall take appropriate measures to protect final customers, and shall, in particular, ensure that there are adequate safeguards to protect vulnerable customers. In this context, each **Contracting Party** shall define the concept of vulnerable customers which may refer to energy poverty and, *inter alia*, to the prohibition of disconnection of electricity to such customers in critical times. **Contracting Parties** shall ensure that rights and obligations linked to vulnerable customers are applied. In particular, they shall take measures to protect final customers in remote areas. They shall ensure high levels of consumer protection, particularly with respect to transparency regarding contractual terms and conditions, general information and dispute settlement mechanisms. **Contracting Parties** shall ensure that the eligible customer is in fact able easily to switch to a new sup-

plier. As regards at least household customers, those measures shall include those set out in Annex I.

8. **Contracting Parties** shall take appropriate measures, such as formulating national energy action plans, providing benefits in social security systems to ensure the necessary electricity supply to vulnerable customers, or providing for support for energy efficiency improvements, to address energy poverty where identified, including in the broader context of poverty. Such measures shall not impede the effective opening of the market set out in Article 33 or market functioning and shall be notified **to the Energy Community Secretariat**, where relevant, in accordance with the provisions of paragraph 15 of this Article. Such notification may also include measures taken within the general social security system.

9. **Contracting Parties** shall ensure that electricity suppliers specify in or with the bills and in promotional materials made available to final customers:

(a) the contribution of each energy source to the overall fuel mix of the supplier over the preceding year in a comprehensible and, at a national level, clearly comparable manner;

(b) at least the reference to existing reference sources, such as web pages, where information on the environmental impact, in terms of at least CO<sub>2</sub> emissions and the radioactive waste resulting from the electricity produced by the overall fuel mix of the supplier over the preceding year is publicly available;

(c) information concerning their rights as regards the means of dispute settlement available to them in the event of a dispute.

As regards points (a) and (b) of the first subparagraph with respect to electricity obtained via an electricity exchange or imported from an undertaking situated outside the **Energy Community**, aggregate figures provided by the exchange or the undertaking in question over the preceding year may be used.

The regulatory authority or another competent national authority shall take the necessary steps to ensure that the information provided by suppliers to their customers pursuant to this Article is reliable and is provided, at a national level, in a clearly comparable manner.

10. **Contracting Parties** shall implement measures to achieve the objectives of social and economic cohesion and environmental protection, which shall include energy efficiency/demand-side management measures and means to combat climate change, and security of supply, where appropriate. Such measures may include, in particular, the provision of adequate economic incentives, using, where appropriate, all existing national and **Energy Community** tools, for the maintenance and construction of the necessary network infrastructure, including interconnection capacity.

11. In order to promote energy efficiency, **Contracting Parties** or, where a **Contracting Party** has so provided, the regulatory authority shall strongly recommend that electricity undertakings optimize the use of electricity, for example by providing energy management services, developing innovative pricing formulas, or introducing intelligent metering systems or smart grids, where appropriate.

12. **Contracting Parties** shall ensure the provision of single points of contact to provide consumers with all necessary information concerning their rights, current legislation and the means of dispute settlement available to them in the event of a dispute. Such contact points may be part of general consumer information points.

13. **Contracting Parties** shall ensure that an independent mechanism such as an energy ombudsman or a consumer body is in place in order to ensure efficient treatment of complaints and out-of-

court dispute settlements.

14. **Contracting Parties** may decide not to apply the provisions of Articles 7, 8, 32 and/or 34 insofar as their application would obstruct the performance, in law or in fact, of the obligations imposed on electricity undertakings in the general economic interest and insofar as the development of trade would not be affected to such an extent as would be contrary to the interests of the **Energy Community**. The interests of the **Energy Community** include, *inter alia*, competition with regard to eligible customers in accordance with this Directive and **Annex III of the Energy Community Treaty**.

15. **Contracting Parties** shall, upon implementation of this Directive, inform the **Energy Community Secretariat** of all measures adopted to fulfil universal service and public service obligations, including consumer protection and environmental protection, and their possible effect on national and international competition, whether or not such measures require a derogation from this Directive. They shall inform the **Energy Community Secretariat** subsequently every two years of any changes to such measures, whether or not they require a derogation from this Directive.

16.<sup>1</sup> **Contracting Parties shall ensure that electricity <...> suppliers or distribution system operators, in cooperation with the regulatory authority, take the necessary steps to provide their consumers with a copy of the energy consumer checklists established by the European Commission <...>.**

**The checklists shall be adopted by the Permanent High Level Group, following the procedure laid down in Article 79 of the Treaty.**

#### **Article 4**

#### **Monitoring of security of supply**

**Contracting Parties** shall ensure the monitoring of security of supply issues. Where **Contracting Parties** consider it appropriate, they may delegate that task to the regulatory authorities referred to in Article 35. Such monitoring shall, in particular, cover the balance of supply and demand on the national market, the level of expected future demand and envisaged additional capacity being planned or under construction, and the quality and level of maintenance of the networks, as well as measures to cover peak demand and to deal with shortfalls of one or more suppliers. The competent authorities shall publish every two years, by 31 July, a report outlining the findings resulting from the monitoring of those issues, as well as any measures taken or envisaged to address them and shall forward that report to the **Energy Community Secretariat** forthwith.

<sup>1</sup> Replaced by Article 6 of Decision 2011/02/MC-EnC.

## Article 5

### Technical rules

The regulatory authorities where **Contracting Parties** have so provided or **Contracting Parties** shall ensure that technical safety criteria are defined and that technical rules establishing the minimum technical design and operational requirements for the connection to the system of generating installations, distribution systems, directly connected consumers' equipment, interconnector circuits and direct lines are developed and made public. Those technical rules shall ensure the interoperability of systems and shall be objective and non-discriminatory. <...>

## Article 6<sup>2</sup>

### Promotion of regional cooperation

1. **Contracting Parties** as well as the regulatory authorities shall cooperate with each other for the purpose of integrating their national markets at regional levels, as a first step towards the creation of a fully liberalized internal market. In particular, the regulatory authorities where **Contracting Parties** have so provided or **Contracting Parties** shall promote and facilitate the cooperation of transmission system operators at a regional level, including on cross-border issues, with the aim of creating a competitive internal market in electricity, foster the consistency of their legal, regulatory and technical framework and facilitate integration of the isolated systems forming electricity islands that persist in the **Energy Community**. **Such regional cooperation shall concern cooperation in the geographical area defined under Title III of the Treaty establishing the Energy Community. It may cover other geographical areas.**
2. The **Energy Community Regulatory Board** shall cooperate with national regulatory authorities and transmission system operators to ensure the compatibility of regulatory frameworks with other European regions with the aim of creating a competitive internal market in electricity that can be fully integrated with the EU internal market.
3. **Contracting Parties** shall ensure, through the implementation of this Directive, that transmission system operators have one or more integrated system(s) at regional level covering two or more **Contracting Parties** for capacity allocation and for checking the security of the network.
4. Where vertically integrated transmission system operators participate in a joint undertaking established for implementing such cooperation, the joint undertaking shall establish and implement a compliance program which sets out the measures to be taken to ensure that discriminatory and anticompetitive conduct is excluded. That compliance programme shall set out the specific obligations of employees to meet the objective of excluding discriminatory and anticompetitive conduct. It shall be notified to the **Energy Community Regulatory Board**. Compliance with the programme shall be independently monitored by the compliance officers of the vertically integrated transmission system operators.

<sup>2</sup> In addition, Article 25 of Decision 2011/02/MC-EnC reads: 'Transmission system operators shall promote operational arrangements in order to ensure the optimum management of the Energy Community network and shall promote the development of energy exchanges, the coordinated allocation of cross-border capacity through non-discriminatory market-based solutions, paying due attention to the specific merits of implicit auctions for short-term allocations, and the integration of balancing and reserve power mechanisms.'

## CHAPTER III

### GENERATION

#### *Article 7*

#### **Authorisation procedure for new capacity**

1. For the construction of new generating capacity, **Contracting Parties** shall adopt an authorisation procedure, which shall be conducted in accordance with objective, transparent and non-discriminatory criteria.

2. **Contracting Parties** shall lay down the criteria for the grant of authorisations for the construction of generating capacity in their territory. In determining appropriate criteria, **Contracting Parties** shall consider:

- (a) the safety and security of the electricity system, installations and associated equipment;
- (b) the protection of public health and safety;
- (c) the protection of the environment;
- (d) land use and siting;
- (e) the use of public ground;
- (f) energy efficiency;
- (g) the nature of the primary sources;
- (h) the characteristics particular to the applicant, such as technical, economic and financial capabilities;
- (i) compliance with measures adopted pursuant to Article 3;
- (j) the contribution of the generating capacity to meeting the overall Energy Community target of at least a 20% share of energy from renewable sources in the Energy Community's gross final consumption of energy in 2020 referred to in Article 3(1) of Directive 2009/28/EC of the European Parliament and of the Council of 23 April 2009 on the promotion of the use of energy from renewable sources;<sup>3</sup> and
- (k) the contribution of generating capacity to reducing emissions.

3. **Contracting Parties** shall ensure that specific authorisation procedures exist for small decentralised and/or distributed generation, which take into account their limited size and potential impact.

**Contracting Parties** may set guidelines for that specific authorisation procedure. National regulatory authorities or other competent national authorities including planning authorities shall review those guidelines and may recommend amendments thereto.

Where **Contracting Parties** have established particular land use permit procedures applying to major new infrastructure projects in generation capacity, **Contracting Parties** shall, where appropriate, include the construction of new generation capacity within the scope of those procedures and shall

<sup>3</sup> Directive 2009/28/EC was incorporated to the Energy Community *acquis* and adapted by Decision 2012/04/MC-EnC of 18 October 2012. According to Article 4(1) of that Decision, the second sentence of Article 3(1) of Directive 2009/28/EC shall not be applicable in the Energy Community.

implement them in a non-discriminatory manner and within an appropriate time-frame.

4. The authorisation procedures and criteria shall be made public. Applicants shall be informed of the reasons for any refusal to grant an authorisation. Those reasons shall be objective, non-discriminatory, well-founded and duly substantiated. Appeal procedures shall be made available to the applicant.

## **Article 8**

### **Tendering for new capacity**

1. **Contracting Parties** shall ensure the possibility, in the interests of security of supply, of providing for new capacity or energy efficiency/demand-side management measures through a tendering procedure or any procedure equivalent in terms of transparency and non-discrimination, on the basis of published criteria. Those procedures may, however, be launched only where, on the basis of the authorisation procedure, the generating capacity to be built or the energy efficiency/demand-side management measures to be taken are insufficient to ensure security of supply.

2. **Contracting Parties** may ensure the possibility, in the interests of environmental protection and the promotion of infant new technologies, of tendering for new capacity on the basis of published criteria. Such tendering may relate to new capacity or to energy efficiency/demand-side management measures. A tendering procedure may, however, be launched only where, on the basis of the authorisation procedure the generating capacity to be built or the measures to be taken, are insufficient to achieve those objectives.

3. Details of the tendering procedure for means of generating capacity and energy efficiency/demand-side management measures shall be published **in a dedicated section of the web site of the Energy Community** at least six months prior to the closing date for tenders.

The tender specifications shall be made available to any interested undertaking established in the territory of a **Contracting Party** so that it has sufficient time in which to submit a tender.

With a view to ensuring transparency and non-discrimination, the tender specifications shall contain a detailed description of the contract specifications and of the procedure to be followed by all tenderers and an exhaustive list of criteria governing the selection of tenderers and the award of the contract, including incentives, such as subsidies, which are covered by the tender. Those specifications may also relate to the fields referred to in Article 7(2).

4. In invitations to tender for the requisite generating capacity, consideration must also be given to electricity supply offers with long-term guarantees from existing generating units, provided that additional requirements can be met in this way.

5. **Contracting Parties** shall designate an authority or a public or private body independent from electricity generation, transmission, distribution and supply activities, which may be a regulatory authority referred to in Article 35(1), to be responsible for the organisation, monitoring and control of the tendering procedure referred to in paragraphs 1 to 4 of this Article. Where a transmission system operator is fully independent from other activities not relating to the transmission system in ownership terms, the transmission system operator may be designated as the body responsible for organising, monitoring and controlling the tendering procedure. That authority or body shall take all necessary steps to ensure confidentiality of the information contained in the tenders.

## CHAPTER IV

### TRANSMISSION SYSTEM OPERATION

#### *Article 9*

#### **Unbundling of transmission systems and transmission system operators**

1. **Contracting Parties** shall ensure that from **1 June 2016**:

(a) each undertaking which owns a transmission system acts as a transmission system operator;

(b) the same person or persons are entitled neither:

(i) directly or indirectly to exercise control over an undertaking performing any of the functions of generation or supply, and directly or indirectly to exercise control or exercise any right over a transmission system operator or over a transmission system; nor

(ii) directly or indirectly to exercise control over a transmission system operator or over a transmission system, and directly or indirectly to exercise control or exercise any right over an undertaking performing any of the functions of generation or supply;

(c) the same person or persons are not entitled to appoint members of the supervisory board, the administrative board or bodies legally representing the undertaking, of a transmission system operator or a transmission system, and directly or indirectly to exercise control or exercise any right over an undertaking performing any of the functions of generation or supply; and

(d) the same person is not entitled to be a member of the supervisory board, the administrative board or bodies legally representing the undertaking, of both an undertaking performing any of the functions of generation or supply and a transmission system operator or a transmission system.

2. The rights referred to in points (b) and (c) of paragraph 1 shall include, in particular:

(a) the power to exercise voting rights;

(b) the power to appoint members of the supervisory board, the administrative board or bodies legally representing the undertaking; or

(c) the holding of a majority share.

3. For the purpose of paragraph 1(b), the notion "undertaking performing any of the functions of generation or supply" shall include "undertaking performing any of the functions of production and supply" within the meaning of Directive 2009/73/EC of the European Parliament and of the Council of 13 July 2009 concerning common rules for the internal market in natural gas, and the terms "transmission system operator" and "transmission system" shall include "transmission system operator" and "transmission system" within the meaning of that Directive.

4. **Contracting Parties** may allow for derogations from points (b) and (c) of paragraph 1 until **1 June 2017**, provided that transmission system operators are not part of a vertically integrated undertaking.

5. The obligation set out in paragraph 1(a) shall be deemed to be fulfilled in a situation where two or more undertakings which own transmission systems have created a joint venture which acts as a transmission system operator in two or more **Contracting Parties** for the transmission systems concerned. No other undertaking may be part of the joint venture, unless it has been approved under

Article 13 as an independent system operator or as an independent transmission operator for the purposes of Chapter V.

6. For the implementation of this Article, where the person referred to in points (b), (c) and (d) of paragraph 1 is the **Contracting Party** or another public body, two separate public bodies exercising control over a transmission system operator or over a transmission system on the one hand, and over an undertaking performing any of the functions of generation or supply on the other, shall be deemed not to be the same person or persons.

7. **Contracting Parties** shall ensure that neither commercially sensitive information referred to in Article 16 held by a transmission system operator which was part of a vertically integrated undertaking, nor the staff of such a transmission system operator, is transferred to undertakings performing any of the functions of generation and supply.

8. Where on **6 October 2011**, the transmission system belongs to a vertically integrated undertaking a **Contracting Party** may decide not to apply paragraph 1.

In such case, the **Contracting Party** concerned shall either:

(a) designate an independent system operator in accordance with Article 13; or

(b) comply with the provisions of Chapter V.

9. Where, on **6 October 2011**, the transmission system belongs to a vertically integrated undertaking and there are arrangements in place which guarantee more effective independence of the transmission system operator than the provisions of Chapter V, a Contracting Party may decide not to apply paragraph 1.

10. Before an undertaking is approved and designated as a transmission system operator under paragraph 9 of this Article, it shall be certified according to the procedures laid down in Article 10(4), (5) and (6) of this Directive and in Article 3 of Regulation (EC) No 714/2009, pursuant to which the **Energy Community Secretariat**, shall verify that the arrangements in place clearly guarantee more effective independence of the transmission system operator than the provisions of Chapter V.

11. Vertically integrated undertakings which own a transmission system shall not in any event be prevented from taking steps to comply with paragraph 1.

12. Undertakings performing any of the functions of generation or supply shall not in any event be able to directly or indirectly take control over or exercise any right over unbundled transmission system operators in **Contracting Parties** which apply paragraph 1.

## **Article 10**

### **Designation and certification of transmission system operators**

1. Before an undertaking is approved and designated as transmission system operator, it shall be certified according to the procedures laid down in paragraphs 4, 5 and 6 of this Article and in Article 3 of Regulation (EC) No 714/2009.

2. Undertakings which own a transmission system and which have been certified by the national regulatory authority as having complied with the requirements of Article 9, pursuant to the certification procedure below, shall be approved and designated as transmission system operators by the **Contracting Parties**. The designation of transmission system operators shall be notified to the

**Energy Community Secretariat** and published in **a dedicated section of the website of the Energy Community.**

3. Transmission system operators shall notify to the regulatory authority any planned transaction which may require a reassessment of their compliance with the requirements of Article 9.

4. Regulatory authorities shall monitor the continuing compliance of transmission system operators with the requirements of Article 9. They shall open a certification procedure to ensure such compliance:

(a) upon notification by the transmission system operator pursuant to paragraph 3;

(b) on their own initiative where they have knowledge that a planned change in rights or influence over transmission system owners or transmission system operators may lead to an infringement of Article 9, or where they have reason to believe that such an infringement may have occurred; or

(c) upon a reasoned request from the **Energy Community Secretariat.**

5. The regulatory authorities shall adopt a decision on the certification of a transmission system operator within a period of four months from the date of the notification by the transmission system operator or from the date of the **Energy Community Secretariat's** request. After expiry of that period, the certification shall be deemed to be granted. The explicit or tacit decision of the regulatory authority shall become effective only after the conclusion of the procedure set out in paragraph 6.

6. The explicit or tacit decision on the certification of a transmission system operator shall be notified without delay to the **Energy Community Secretariat** by the regulatory authority, together with all the relevant information with respect to that decision. The **Energy Community Secretariat** shall act in accordance with the procedure laid down in Article 3 of Regulation (EC) No 714/2009.

7. The regulatory authorities and the **Energy Community Secretariat** may request from transmission system operators and undertakings performing any of the functions of generation or supply any information relevant for the fulfilment of their tasks under this Article.

8. Regulatory authorities and the **Energy Community Secretariat** shall preserve the confidentiality of commercially sensitive information.

## **Article 11**

### **Certification in relation to third countries**

1. Where certification is requested by a transmission system owner or a transmission system operator which is controlled by a person or persons from a third country or third countries, the regulatory authority shall notify the **Energy Community Secretariat.**

The regulatory authority shall also notify to the **Energy Community Secretariat** without delay any circumstances that would result in a person or persons from a third country or third countries acquiring control of a transmission system or a transmission system operator.

2. The transmission system operator shall notify to the regulatory authority any circumstances that would result in a person or persons from a third country or third countries acquiring control of the transmission system or the transmission system operator.

3. The regulatory authority shall adopt a draft decision on the certification of a transmission system operator within four months from the date of notification by the transmission system operator. It

shall refuse the certification if it has not been demonstrated:

(a) that the entity concerned complies with the requirements of Article 9; and  
 (b) to the regulatory authority or to another competent authority designated by the **Contracting Party** that granting certification will not put at risk the security of energy supply of the **Contracting Party** and the **Energy Community**. In considering that question the regulatory authority or other competent authority so designated shall take into account:

(i) the rights and obligations of the **Energy Community** with respect to that third country arising under international law, including any agreement concluded with one or more third countries to which the **Energy Community** is a party and which addresses the issues of security of energy supply

(ii) the rights and obligations of the **Contracting Party** with respect to that third country arising under agreements concluded with it, insofar as they are in compliance with Energy Community law; and

(iii) other specific facts and circumstances of the case and the third country concerned.<sup>4</sup>

4. The regulatory authority shall notify the decision to the **Energy Community Secretariat** without delay, together with all the relevant information with respect to that decision.

5. **Contracting Parties** shall provide for the regulatory authority or the designated competent authority referred to in paragraph 3(b), before the regulatory authority adopts a decision on the certification, to request an opinion from the **Energy Community Secretariat** on whether:

(a) the entity concerned complies with the requirements of Article 9; and

(b) granting certification will not put at risk the security of energy supply to the **Energy Community**.

6. The **Energy Community Secretariat** shall examine the request referred to in paragraph 5 as soon as it is received. Within a period of two months after receiving the request, it shall deliver its opinion to the national regulatory authority or, if the request was made by the designated competent authority, to that authority.

**In preparing its opinion, the Energy Community Secretariat shall request the views of the Energy Community Regulatory Board.** It may also request the views of the **Contracting Party** concerned, and interested parties. In the event that the **Energy Community Secretariat** makes such a request, the two-month period shall be extended by two months.

In the absence of an opinion by the **Energy Community Secretariat** within the period referred to in the first and second subparagraphs, the **Energy Community Secretariat** shall be deemed not to raise objections to the decision of the regulatory authority.

7. When assessing whether the control by a person or persons from a third country or third countries will put at risk the security of energy supply to the **Energy Community**, the **Energy Community Secretariat** shall take into account:

(a) the specific facts of the case and the third country or third countries concerned; and

(b) the rights and obligations of the **Energy Community** with respect to that third country arising under international law, including any agreement concluded with one or more third countries to

<sup>4</sup> According to Article 10(1) of Decision 2011/02/MC-EnC, 'the regulatory authority or other competent authority designated shall also take into account the rights and obligations resulting from association or trade agreements between the Contracting Party and the European Union'.

which the **Energy Community** is a party and which addresses the issues of security of energy supply.<sup>5</sup>

8. The national regulatory authority shall, within a period of two months after the expiry of the period referred to in paragraph 6, adopt its final decision on the certification. In adopting its final decision the national regulatory authority shall take utmost account of the opinion of the **Energy Community Secretariat**. In any event **Contracting Parties** shall have the right to refuse certification where granting certification puts at risk the **Contracting Party's** security of energy supply or the security of energy supply of another **Contracting Party**. Where the **Contracting Party** has designated another competent authority to assess paragraph 3(b), it may require the national regulatory authority to adopt its final decision in accordance with the assessment of that competent authority. The national regulatory authority's final decision and the opinion of the **Energy Community Secretariat** shall be published together. Where the final decision diverges from the **Secretariat's** opinion, the **Contracting Party** concerned shall provide and publish, together with that decision, the reasoning underlying such decision.

9. Nothing in this Article shall affect the right of **Contracting Parties** to exercise, in compliance with **Energy Community** law, national legal controls to protect legitimate public security interests.

10. <...>

11. <...>

## Article 12

### Tasks of transmission system operators

Each transmission system operator shall be responsible for:

- (a) ensuring the long-term ability of the system to meet reasonable demands for the transmission of electricity, operating, maintaining and developing under economic conditions secure, reliable and efficient transmission systems with due regard to the environment;
- (b) ensuring adequate means to meet service obligations;
- (c) contributing to security of supply through adequate transmission capacity and system reliability;
- (d) managing electricity flows on the system, taking into account exchanges with other interconnected systems. To that end, the transmission system operator shall be responsible for ensuring a secure, reliable and efficient electricity system and, in that context, for ensuring the availability of all necessary ancillary services, including those provided by demand response, insofar as such availability is independent from any other transmission system with which its system is interconnected;
- (e) providing to the operator of any other system with which its system is interconnected sufficient information to ensure the secure and efficient operation, coordinated development and interoperability of the interconnected system;
- (f) ensuring non-discrimination as between system users or classes of system users, particularly in favour of its related undertakings;
- (g) providing system users with the information they need for efficient access to the system; and

<sup>5</sup> According to Article 10(2) of Decision 2011/02/MC-EnC, Article 10(1) of the same Decision applies - 'the regulatory authority or other competent authority designated shall also take into account the rights and obligations resulting from association or trade agreements between the Contracting Party and the European Union'.

(h) collecting congestion rents and payments under the inter-transmission system operator compensation mechanism, in compliance with Article 13 of Regulation (EC) No 714/2009, granting and managing third-party access and giving reasoned explanations when it denies such access, which shall be monitored by the national regulatory authorities; in carrying out their tasks under this Article transmission system operators shall primarily facilitate market integration.

### **Article 13**

#### **Independent system operator**

1. Where the transmission system belongs to a vertically integrated undertaking on **6 October 2011**, **Contracting Parties** may decide not to apply Article 9(1) and designate an independent system operator upon a proposal from the transmission system owner. Such designation shall be subject to **the opinion of the Energy Community Secretariat**.

2. The **Contracting Party** may approve and designate an independent system operator only where:

(a) the candidate operator has demonstrated that it complies with the requirements of Article 9(1) (b), (c) and (d);

(b) the candidate operator has demonstrated that it has at its disposal the required financial, technical, physical and human resources to carry out its tasks under Article 12;

(c) the candidate operator has undertaken to comply with a ten-year network development plan monitored by the regulatory authority;

(d) the transmission system owner has demonstrated its ability to comply with its obligations under paragraph 5. To that end, it shall provide all the draft contractual arrangements with the candidate undertaking and any other relevant entity; and

(e) the candidate operator has demonstrated its ability to comply with its obligations under Regulation (EC) No 714/2009, including the cooperation of transmission system operators at European and regional level.

3. Undertakings which have been certified by the regulatory authority as having complied with the requirements of Article 11 and paragraph 2 of this Article shall be approved and designated as independent system operators by **Contracting Parties**. The certification procedure in either Article 10 of this Directive and Article 3 of Regulation (EC) No 714/2009, or in Article 11 of this Directive shall be applicable.

4. Each independent system operator shall be responsible for granting and managing third-party access, including the collection of access charges, congestion charges, and payments under the inter-transmission system operator compensation mechanism in compliance with Article 13 of Regulation (EC) No 714/2009, as well as for operating, maintaining and developing the transmission system, and for ensuring the long-term ability of the system to meet reasonable demand through investment planning. When developing the transmission system, the independent system operator shall be responsible for planning (including authorization procedure), construction and commissioning of the new infrastructure. For this purpose, the independent system operator shall act as a transmission system operator in accordance with this Chapter. The transmission system owner shall not be responsible for granting and managing third-party access, nor for investment planning.

5. Where an independent system operator has been designated, the transmission system owner shall:

(a) provide all the relevant cooperation and support to the independent system operator for the fulfillment of its tasks, including in particular all relevant information;

(b) finance the investments decided by the independent system operator and approved by the regulatory authority, or give its agreement to financing by any interested party including the independent system operator. The relevant financial arrangements shall be subject to approval by the regulatory authority. Prior to such approval, the regulatory authority shall consult the transmission system owner together with the other interested parties;

(c) provide for the coverage of liability relating to the network assets, excluding the liability relating to the tasks of the independent system operator; and

(d) provide guarantees to facilitate financing any network expansions with the exception of those investments where, pursuant to point (b), it has given its agreement to financing by any interested party including the independent system operator.

6. In close cooperation with the regulatory authority, the relevant national competition authority shall be granted all relevant powers to effectively monitor compliance of the transmission system owner with its obligations under paragraph 5.

#### **Article 14**

#### **Unbundling of transmission system owners**

1. A transmission system owner, where an independent system operator has been appointed, which is part of a vertically integrated undertaking shall be independent at least in terms of its legal form, organization and decision making from other activities not relating to transmission.

2. In order to ensure the independence of the transmission system owner referred to in paragraph 1, the following minimum criteria shall apply:

(a) persons responsible for the management of the transmission system owner shall not participate in company structures of the integrated electricity undertaking responsible, directly or indirectly, for the day-to-day operation of the generation, distribution and supply of electricity;

(b) appropriate measures shall be taken to ensure that the professional interests of persons responsible for the management of the transmission system owner are taken into account in a manner that ensures that they are capable of acting independently; and

(c) the transmission system owner shall establish a compliance program, which sets out measures taken to ensure that discriminatory conduct is excluded, and ensure that observance of it is adequately monitored. The compliance program shall set out the specific obligations of employees to meet those objectives. An annual report, setting out the measures taken, shall be submitted by the person or body responsible for monitoring the compliance program to the regulatory authority and shall be published.

3. <...>

## **Article 15**

### **Dispatching and balancing**

1. Without prejudice to the supply of electricity on the basis of contractual obligations, including those which derive from the tendering specifications, the transmission system operator shall, where it has such a function, be responsible for dispatching the generating installations in its area and for determining the use of interconnectors with other systems.
2. The dispatching of generating installations and the use of interconnectors shall be determined on the basis of criteria which shall be approved by national regulatory authorities where competent and which must be objective, published and applied in a non-discriminatory manner, ensuring the proper functioning of the internal market in electricity. The criteria shall take into account the economic precedence of electricity from available generating installations or interconnector transfers and the technical constraints on the system.
3. A **Contracting Party** shall require system operators to act in accordance with Article 16 of Directive 2009/28/EC, when dispatching generating installations using renewable energy sources. They also may require the system operator to give priority when dispatching generating installations producing combined heat and power.
4. A **Contracting Party** may, for reasons of security of supply, direct that priority be given to the dispatch of generating installations using indigenous primary energy fuel sources, to an extent not exceeding, in any calendar year, 15% of the overall primary energy necessary to produce the electricity consumed in the **Contracting Party** concerned.
5. The regulatory authorities where **Contracting Parties** have so provided or **Contracting Parties** shall require transmission system operators to comply with minimum standards for the maintenance and development of the transmission system, including interconnection capacity.
6. Transmission system operators shall procure the energy they use to cover energy losses and reserve capacity in their system according to transparent, non-discriminatory and market-based procedures, whenever they have such a function.
7. Rules adopted by transmission system operators for balancing the electricity system shall be objective, transparent and non-discriminatory, including rules for charging system users of their networks for energy imbalance. The terms and conditions, including the rules and tariffs, for the provision of such services by transmission system operators shall be established pursuant to a methodology compatible with Article 37(6) in a non-discriminatory and cost-reflective way and shall be published.

## **Article 16**

### **Confidentiality for transmission system operators and transmission system owners**

1. Without prejudice to Article 30 or any other legal duty to disclose information, each transmission system operator and each transmission system owner shall preserve the confidentiality of commercially sensitive information obtained in the course of carrying out its activities, and shall prevent information about its own activities which may be commercially advantageous from being disclosed in a discriminatory manner. In particular it shall not disclose any commercially sensitive information to the remaining parts of the undertaking, unless this is necessary for carrying out a business transaction.

In order to ensure the full respect of the rules on information unbundling, **Contracting Parties** shall ensure that the transmission system owner and the remaining part of the undertaking do not use joint services, such as joint legal services, apart from purely administrative or IT functions.

2. Transmission system operators shall not, in the context of sales or purchases of electricity by related undertakings, misuse commercially sensitive information obtained from third parties in the context of providing or negotiating access to the system.

3. Information necessary for effective competition and the efficient functioning of the market shall be made public. That obligation shall be without prejudice to preserving the confidentiality of commercially sensitive information.

## CHAPTER V

### INDEPENDENT TRANSMISSION OPERATOR

#### *Article 17*

##### **Assets, equipment, staff and identity**

1. Transmission system operators shall be equipped with all human, technical, physical and financial resources necessary for fulfilling their obligations under this Directive and carrying out the activity of electricity transmission, in particular:

(a) assets that are necessary for the activity of electricity transmission, including the transmission system, shall be owned by the transmission system operator;

(b) personnel, necessary for the activity of electricity transmission, including the performance of all corporate tasks, shall be employed by the transmission system operator;

(c) leasing of personnel and rendering of services, to and from any other parts of the vertically integrated undertaking shall be prohibited. A transmission system operator may, however, render services to the vertically integrated undertaking as long as:

(i) the provision of those services does not discriminate between system users, is available to all system users on the same terms and conditions and does not restrict, distort or prevent competition in generation or supply; and

(ii) the terms and conditions of the provision of those services are approved by the regulatory authority;

(d) without prejudice to the decisions of the Supervisory Body under Article 20, appropriate financial resources for future investment projects and/or for the replacement of existing assets shall be made available to the transmission system operator in due time by the vertically integrated undertaking following an appropriate request from the transmission system operator.

2. The activity of electricity transmission shall include at least the following tasks in addition to those listed in Article 12:

(a) the representation of the transmission system operator and contacts to third parties and the regulatory authorities;

(b) <...>

- (c) granting and managing third-party access on a non-discriminatory basis between system users or classes of system users;
  - (d) the collection of all the transmission system related charges including access charges, balancing charges for ancillary services such as purchasing of services (balancing costs, energy for losses);
  - (e) the operation, maintenance and development of a secure, efficient and economic transmission system;
  - (f) investment planning ensuring the long-term ability of the system to meet reasonable demand and guaranteeing security of supply;
  - (g) the setting up of appropriate joint ventures, including with one or more transmission system operators, power exchanges, and the other relevant actors pursuing the objectives to develop the creation of regional markets or to facilitate the liberalisation process; and
  - (h) all corporate services, including legal services, accountancy and IT services.
3. Transmission system operators shall be organized in a legal form as referred to in Article 1 of Council Directive 68/151/EEC.
  4. The transmission system operator shall not, in its corporate identity, communication, branding and premises, create confusion in respect of the separate identity of the vertically integrated undertaking or any part thereof.
  5. The transmission system operator shall not share IT systems or equipment, physical premises and security access systems with any part of the vertically integrated undertaking nor use the same consultants or external contractors for IT systems or equipment, and security access systems.
  6. The accounts of transmission system operators shall be audited by an auditor other than the one auditing the vertically integrated undertaking or any part thereof.

### **Article 18**

#### **Independence of the transmission system operator**

1. Without prejudice to the decisions of the Supervisory Body under Article 20, the transmission system operator shall have:
  - (a) effective decision-making rights, independent from the vertically integrated undertaking, with respect to assets necessary to operate, maintain or develop the transmission system; and
  - (b) the power to raise money on the capital market in particular through borrowing and capital increase.
2. The transmission system operator shall at all times act so as to ensure it has the resources it needs in order to carry out the activity of transmission properly and efficiently and develop and maintain an efficient, secure and economic transmission system.
3. Subsidiaries of the vertically integrated undertaking performing functions of generation or supply shall not have any direct or indirect shareholding in the transmission system operator. The transmission system operator shall neither have any direct or indirect shareholding in any subsidiary of the vertically integrated undertaking performing functions of generation or supply, nor receive dividends or any other financial benefit from that subsidiary.

4. The overall management structure and the corporate statutes of the transmission system operator shall ensure effective independence of the transmission system operator in compliance with this Chapter. The vertically integrated undertaking shall not determine, directly or indirectly, the competitive behaviour of the transmission system operator in relation to the day to day activities of the transmission system operator and management of the network, or in relation to activities necessary for the preparation of the ten-year network development plan developed pursuant to Article 22.

5. In fulfilling their tasks in Article 12 and Article 17(2) of this Directive, and in complying with Articles 14, 15 and 16 of Regulation (EC) No 714/2009, transmission system operators shall not discriminate against different persons or entities and shall not restrict, distort or prevent competition in generation or supply.

6. Any commercial and financial relations between the vertically integrated undertaking and the transmission system operator, including loans from the transmission system operator to the vertically integrated undertaking, shall comply with market conditions. The transmission system operator shall keep detailed records of such commercial and financial relations and make them available to the regulatory authority upon request.

7. The transmission system operator shall submit for approval by the regulatory authority all commercial and financial agreements with the vertically integrated undertaking.

8. The transmission system operator shall inform the regulatory authority of the financial resources, referred to in Article 17(1)(d), available for future investment projects and/or for the replacement of existing assets.

9. The vertically integrated undertaking shall refrain from any action impeding or prejudicing the transmission system operator from complying with its obligations in this Chapter and shall not require the transmission system operator to seek permission from the vertically integrated undertaking in fulfilling those obligations.

10. An undertaking which has been certified by the regulatory authority as being in compliance with the requirements of this Chapter shall be approved and designated as a transmission system operator by the **Contracting Party** concerned. The certification procedure in either Article 10 of this Directive and Article 3 of Regulation (EC) No 714/2009, or in Article 11 of this Directive shall apply.

### **Article 19**

#### **Independence of the staff and the management of the transmission system operator**

1. Decisions regarding the appointment and renewal, working conditions including remuneration, and termination of the term of office of the persons responsible for the management and/or members of the administrative bodies of the transmission system operator shall be taken by the Supervisory Body of the transmission system operator appointed in accordance with Article 20.

2. The identity and the conditions governing the term, the duration and the termination of office of the persons nominated by the Supervisory Body for appointment or renewal as persons responsible for the executive management and/or as members of the administrative bodies of the transmission system operator, and the reasons for any proposed decision terminating such term of office, shall be notified to the regulatory authority. Those conditions and the decisions referred to in paragraph 1 shall become binding only if the regulatory authority has raised no objections within three weeks

of notification.

The regulatory authority may object to the decisions referred to in paragraph 1 where:

(a) doubts arise as to the professional independence of a nominated person responsible for the management and/or member of the administrative bodies; or

(b) in the case of premature termination of a term of office, doubts exist regarding the justification of such premature termination.

3. No professional position or responsibility, interest or business relationship, directly or indirectly, with the vertically integrated undertaking or any part of it or its controlling shareholders other than the transmission system operator shall be exercised for a period of three years before the appointment of the persons responsible for the management and/or members of the administrative bodies of the transmission system operator who are subject to this paragraph.

4. The persons responsible for the management and/or members of the administrative bodies, and employees of the transmission system operator shall have no other professional position or responsibility, interest or business relationship, directly or indirectly, with any other part of the vertically integrated undertaking or with its controlling shareholders.

5. The persons responsible for the management and/or members of the administrative bodies, and employees of the transmission system operator shall hold no interest in or receive any financial benefit, directly or indirectly, from any part of the vertically integrated undertaking other than the transmission system operator. Their remuneration shall not depend on activities or results of the vertically integrated undertaking other than those of the transmission system operator.

6. Effective rights of appeal to the regulatory authority shall be guaranteed for any complaints by the persons responsible for the management and/or members of the administrative bodies of the transmission system operator against premature terminations of their term of office.

7. After termination of their term of office in the transmission system operator, the persons responsible for its management and/or members of its administrative bodies shall have no professional position or responsibility, interest or business relationship with any part of the vertically integrated undertaking other than the transmission system operator, or with its controlling shareholders for a period of not less than four years.

8. Paragraph 3 shall apply to the majority of the persons responsible for the management and/or members of the administrative bodies of the transmission system operator.

The persons responsible for the management and/or members of the administrative bodies of the transmission system operator who are not subject to paragraph 3 shall have exercised no management or other relevant activity in the vertically integrated undertaking for a period of at least six months before their appointment.

The first subparagraph of this paragraph and paragraphs 4 to 7 shall be applicable to all the persons belonging to the executive management and to those directly reporting to them on matters related to the operation, maintenance or development of the network.

## Article 20

### Supervisory Body

1. The transmission system operator shall have a Supervisory Body which shall be in charge of taking decisions which may have a significant impact on the value of the assets of the shareholders within the transmission system operator, in particular decisions regarding the approval of the annual and longer-term financial plans, the level of indebtedness of the transmission system operator and the amount of dividends distributed to shareholders. The decisions falling under the remit of the Supervisory Body shall exclude those that are related to the day to day activities of the transmission system operator and management of the network, and to activities necessary for the preparation of the ten-year network development plan developed pursuant to Article 22.

2. The Supervisory Body shall be composed of members representing the vertically integrated undertaking, members representing third party shareholders and, where the relevant legislation of a **Contracting Party** so provides, members representing other interested parties such as employees of the transmission system operator.

3. The first subparagraph of Article 19(2) and Article 19(3) to (7) shall apply to at least half of the members of the Supervisory Body minus one.

Point (b) of the second subparagraph of Article 19(2) shall apply to all the members of the Supervisory Body.

## Article 21

### Compliance programme and compliance officer

1. **Contracting Parties** shall ensure that transmission system operators establish and implement a compliance programme which sets out the measures taken in order to ensure that discriminatory conduct is excluded, and ensure that the compliance with that programme is adequately monitored. The compliance programme shall set out the specific obligations of employees to meet those objectives. It shall be subject to approval by the regulatory authority. Without prejudice to the powers of the national regulator, compliance with the program shall be independently monitored by a compliance officer.

2. The compliance officer shall be appointed by the Supervisory Body, subject to the approval by the regulatory authority. The regulatory authority may refuse the approval of the compliance officer only for reasons of lack of independence or professional capacity. The compliance officer may be a natural or legal person. Article 19(2) to (8) shall apply to the compliance officer.

3. The compliance officer shall be in charge of:

(a) monitoring the implementation of the compliance programme;

(b) elaborating an annual report, setting out the measures taken in order to implement the compliance programme and submitting it to the regulatory authority;

(c) reporting to the Supervisory Body and issuing recommendations on the compliance programme and its implementation;

(d) notifying the regulatory authority on any substantial breaches with regard to the implementation of the compliance programme; and

(e) reporting to the regulatory authority on any commercial and financial relations between the vertically integrated undertaking and the transmission system operator.

4. The compliance officer shall submit the proposed decisions on the investment plan or on individual investments in the network to the regulatory authority. This shall occur at the latest when the management and/or the competent administrative body of the transmission system operator submits them to the Supervisory Body.

5. Where the vertically integrated undertaking, in the general assembly or through the vote of the members of the Supervisory Body it has appointed, has prevented the adoption of a decision with the effect of preventing or delaying investments, which under the ten-year network development plan was to be executed in the following three years, the compliance officer shall report this to the regulatory authority, which then shall act in accordance with Article 22.

6. The conditions governing the mandate or the employment conditions of the compliance officer, including the duration of its mandate, shall be subject to approval by the regulatory authority. Those conditions shall ensure the independence of the compliance officer, including by providing him with all the resources necessary for fulfilling his duties. During his mandate, the compliance officer shall have no other professional position, responsibility or interest, directly or indirectly, in or with any part of the vertically integrated undertaking or with its controlling shareholders.

7. The compliance officer shall report regularly, either orally or in writing, to the regulatory authority and shall have the right to report regularly, either orally or in writing, to the Supervisory Body of the transmission system operator.

8. The compliance officer may attend all meetings of the management or administrative bodies of the transmission system operator, and those of the Supervisory Body and the general assembly. The compliance officer shall attend all meetings that address the following matters:

(a) conditions for access to the network, as defined in Regulation (EC) No 714/2009, in particular regarding tariffs, third party access services, capacity allocation and congestion management, transparency, balancing and secondary markets;

(b) projects undertaken in order to operate, maintain and develop the transmission system, including interconnection and connection investments;

(c) energy purchases or sales necessary for the operation of the transmission system.

9. The compliance officer shall monitor the compliance of the transmission system operator with Article 16.

10. The compliance officer shall have access to all relevant data and to the offices of the transmission system operator and to all the information necessary for the fulfilment of his task.

11. After prior approval by the regulatory authority, the Supervisory Body may dismiss the compliance officer. It shall dismiss the compliance officer for reasons of lack of independence or professional capacity upon request of the regulatory authority.

12. The compliance officer shall have access to the offices of the transmission system operator without prior announcement.

## Article 22

### Network development and powers to make investment decisions

1. Every year, transmission system operators shall submit to the regulatory authority a ten-year network development plan based on existing and forecast supply and demand after having consulted all the relevant stakeholders. That network development plan shall contain efficient measures in order to guarantee the adequacy of the system and the security of supply.

2. The ten-year network development plan shall in particular:

(a) indicate to market participants the main transmission infrastructure that needs to be built or upgraded over the next ten years;

(b) contain all the investments already decided and identify new investments which have to be executed in the next three years; and

(c) provide for a time frame for all investment projects.

3. When elaborating the ten-year network development plan, the transmission system operator shall make reasonable assumptions about the evolution of the generation, supply, consumption and exchanges with other countries, taking into account investment plans for regional and **Energy Community**-wide networks.

4. The regulatory authority shall consult all actual or potential system users on the ten-year network development plan in an open and transparent manner. Persons or undertakings claiming to be potential system users may be required to substantiate such claims. The regulatory authority shall publish the result of the consultation process, in particular possible needs for investments.

5. The regulatory authority shall examine whether the ten-year network development plan covers all investment needs identified during the consultation process <...>. The regulatory authority may require the transmission system operator to amend its ten-year network development plan.

6. The regulatory authority shall monitor and evaluate the implementation of the ten-year network development plan.

7. In circumstances where the transmission system operator, other than for overriding reasons beyond its control, does not execute an investment, which, under the ten-year network development plan, was to be executed in the following three years, **Contracting Parties** shall ensure that the regulatory authority is required to take at least one of the following measures to ensure that the investment in question is made if such investment is still relevant on the basis of the most recent ten-year network development plan:

(a) to require the transmission system operator to execute the investments in question;

(b) to organise a tender procedure open to any investors for the investment in question; or

(c) to oblige the transmission system operator to accept a capital increase to finance the necessary investments and allow independent investors to participate in the capital.

Where the regulatory authority has made use of its powers under point (b) of the first subparagraph, it may oblige the transmission system operator to agree to one or more of the following:

(a) financing by any third party;

(b) construction by any third party;

- (c) building the new assets concerned itself;
- (d) operating the new asset concerned itself.

The transmission system operator shall provide the investors with all information needed to realise the investment, shall connect new assets to the transmission network and shall generally make its best efforts to facilitate the implementation of the investment project.

The relevant financial arrangements shall be subject to approval by the regulatory authority.

8. Where the regulatory authority has made use of its powers under the first subparagraph of paragraph 7, the relevant tariff regulations shall cover the costs of the investments in question.

### **Article 23**

#### **Decision-making powers regarding the connection of new power plant to the transmission system**

1. The transmission system operator shall establish and publish transparent and efficient procedures for non-discriminatory connection of new power plants to the transmission system. Those procedures shall be subject to the approval of national regulatory authorities.

2. The transmission system operator shall not be entitled to refuse the connection of a new power plant on the grounds of possible future limitations to available network capacities, such as congestion in distant parts of the transmission system. The transmission system operator shall supply necessary information.

3. The transmission system operator shall not be entitled to refuse a new connection point, on the ground that it will lead to additional costs linked with necessary capacity increase of system elements in the close-up range to the connection point.

## **CHAPTER VI**

### **DISTRIBUTION SYSTEM OPERATION**

#### **Article 24**

##### **Designation of distribution system operators**

**Contracting Parties** shall designate or shall require undertakings that own or are responsible for distribution systems to designate, for a period of time to be determined by **Contracting Parties** having regard to considerations of efficiency and economic balance, one or more distribution system operators. **Contracting Parties** shall ensure that distribution system operators act in accordance with Articles 25, 26 and 27.

## Article 25

### Tasks of distribution system operators

1. The distribution system operator shall be responsible for ensuring the long-term ability of the system to meet reasonable demands for the distribution of electricity, for operating, maintaining and developing under economic conditions a secure, reliable and efficient electricity distribution system in its area with due regard for the environment and energy efficiency.
2. In any event, it must not discriminate between system users or classes of system users, particularly in favour of its related undertakings.
3. The distribution system operator shall provide system users with the information they need for efficient access to, including use of the system.
4. A **Contracting Party** may require the distribution system operator, when dispatching generating installations, to give priority to generating installations using renewable energy sources or waste or producing combined heat and power.
5. Each distribution system operator shall procure the energy it uses to cover energy losses and reserve capacity in its system according to transparent, non-discriminatory and market based procedures, whenever it has such a function. That requirement shall be without prejudice to using electricity acquired under contracts concluded before **1 January 2006**.
6. Where a distribution system operator is responsible for balancing the distribution system, rules adopted by it for that purpose shall be objective, transparent and non-discriminatory, including rules for the charging of system users of their networks for energy imbalance. Terms and conditions, including rules and tariffs, for the provision of such services by distribution system operators shall be established in accordance with Article 37(6) in a non-discriminatory and cost-reflective way and shall be published.
7. When planning the development of the distribution network, energy efficiency/demand-side management measures or distributed generation that might supplant the need to upgrade or replace electricity capacity shall be considered by the distribution system operator.

## Article 26

### Unbundling of distribution system operators

1. Where the distribution system operator is part of a vertically integrated undertaking, it shall be independent at least in terms of its legal form, organisation and decision making from other activities not relating to distribution. Those rules shall not create an obligation to separate the ownership of assets of the distribution system operator from the vertically integrated undertaking.
2. In addition to the requirements under paragraph 1, where the distribution system operator is part of a vertically integrated undertaking, it shall be independent in terms of its organisation and decision-making from the other activities not related to distribution. In order to achieve this, the following minimum criteria shall apply:
  - (a) those persons responsible for the management of the distribution system operator must not participate in company structures of the integrated electricity undertaking responsible, directly or

indirectly, for the day-to-day operation of the generation, transmission or supply of electricity;

(b) appropriate measures must be taken to ensure that the professional interests of the persons responsible for the management of the distribution system operator are taken into account in a manner that ensures that they are capable of acting independently;

(c) the distribution system operator must have effective decision-making rights, independent from the integrated electricity undertaking, with respect to assets necessary to operate, maintain or develop the network. In order to fulfil those tasks, the distribution system operator shall have at its disposal the necessary resources including human, technical, physical and financial resources. This should not prevent the existence of appropriate coordination mechanisms to ensure that the economic and management supervision rights of the parent company in respect of return on assets, regulated indirectly in accordance with Article 37(6), in a subsidiary are protected. In particular, this shall enable the parent company to approve the annual financial plan, or any equivalent instrument, of the distribution system operator and to set global limits on the levels of indebtedness of its subsidiary. It shall not permit the parent company to give instructions regarding day-to-day operations, nor with respect to individual decisions concerning the construction or upgrading of distribution lines, that do not exceed the terms of the approved financial plan, or any equivalent instrument; and

(d) the distribution system operator must establish a compliance programme, which sets out measures taken to ensure that discriminatory conduct is excluded, and ensure that observance of it is adequately monitored. The compliance programme shall set out the specific obligations of employees to meet that objective. An annual report, setting out the measures taken, shall be submitted by the person or body responsible for monitoring the compliance programme, the compliance officer of the distribution system operator, to the regulatory authority referred to in Article 35(1) and shall be published. The compliance officer of the distribution system operator shall be fully independent and shall have access to all the necessary information of the distribution system operator and any affiliated undertaking to fulfil his task.

3. Where the distribution system operator is part of a vertically integrated undertaking, the Contracting Parties shall ensure that the activities of the distribution system operator are monitored by regulatory authorities or other competent bodies so that it cannot take advantage of its vertical integration to distort competition. In particular, vertically integrated distribution system operators shall not, in their communication and branding, create confusion in respect of the separate identity of the supply branch of the vertically integrated undertaking.

4. **Contracting Parties** may decide not to apply paragraphs 1, 2 and 3 to integrated electricity undertakings serving less than 100 000 connected customers, or serving small isolated systems.

### **Article 27**

#### **Confidentiality obligation of distribution system operators**

Without prejudice to Article 30 or any other legal duty to disclose information, the distribution system operator must preserve the confidentiality of commercially sensitive information obtained in the course of carrying out its business, and shall prevent information about its own activities which may be commercially advantageous being disclosed in a discriminatory manner.

### **Article 28**

#### **Closed distribution systems**

1. **Contracting Parties** may provide for national regulatory authorities or other competent authorities to classify a system which distributes electricity within a geographically confined industrial, commercial or shared services site and does not, without prejudice to paragraph 4, supply household customers, as a closed distribution system if:

(a) for specific technical or safety reasons, the operations or the production process of the users of that system are integrated; or

(b) that system distributes electricity primarily to the owner or operator of the system or their related undertakings.

2. **Contracting Parties** may provide for national regulatory authorities to exempt the operator of a closed distribution system from:

(a) the requirement under Article 25(5) to procure the energy it uses to cover energy losses and reserve capacity in its system according to transparent, non-discriminatory and market based procedures;

(b) the requirement under Article 32(1) that tariffs, or the methodologies underlying their calculation, are approved prior to their entry into force in accordance with Article 37.

3. Where an exemption is granted under paragraph 2, the applicable tariffs, or the methodologies underlying their calculation, shall be reviewed and approved in accordance with Article 37 upon request by a user of the closed distribution system.

4. Incidental use by a small number of households with employment or similar associations with the owner of the distribution system and located within the area served by a closed distribution system shall not preclude an exemption under paragraph 2 being granted.

### **Article 29**

#### **Combined operator**

Article 26(1) shall not prevent the operation of a combined transmission and distribution system operator provided that operator complies with Articles 9(1), or 13 and 14, or Chapter V or falls under Article 44(2).

## **CHAPTER VII**

### **UNBUNDLING AND TRANSPARENCY OF ACCOUNTS**

#### **Article 30**

##### **Right of access to accounts**

1. **Contracting Parties** or any competent authority they designate, including the regulatory author-

ities referred to in Article 35, shall, insofar as necessary to carry out their functions, have right of access to the accounts of electricity undertakings as set out in Article 31.

2. **Contracting Parties** and any designated competent authority, including the regulatory authorities, shall preserve the confidentiality of commercially sensitive information. **Contracting Parties** may provide for the disclosure of such information where this is necessary in order for the competent authorities to carry out their functions.

### **Article 31**

#### **Unbundling of accounts**

1. **Contracting Parties** shall take the necessary steps to ensure that the accounts of electricity undertakings are kept in accordance with paragraphs 2 and 3.

2. Electricity undertakings, whatever their system of ownership or legal form, shall draw up, submit to audit and publish their annual accounts in accordance with the rules of national law concerning the annual accounts of limited liability companies adopted pursuant to the Fourth Council Directive 78/660/EEC of 25 July 1978 based on Article 44(2)(g) of the Treaty on the annual accounts of certain types of companies.

Undertakings which are not legally obliged to publish their annual accounts shall keep a copy of these at the disposal of the public in their head office.

3. Electricity undertakings shall, in their internal accounting, keep separate accounts for each of their transmission and distribution activities as they would be required to do if the activities in question were carried out by separate undertakings, with a view to avoiding discrimination, cross-subsidisation and distortion of competition. They shall also keep accounts, which may be consolidated, for other electricity activities not relating to transmission or distribution. Until **1 January 2015**, they shall keep separate accounts for supply activities for eligible customers and supply activities for non-eligible customers. Revenue from ownership of the transmission or distribution system shall be specified in the accounts. Where appropriate, they shall keep consolidated accounts for other, non-electricity activities. The internal accounts shall include a balance sheet and a profit and loss account for each activity.

4. The audit referred to in paragraph 2 shall, in particular, verify that the obligation to avoid discrimination and cross-subsidies referred to in paragraph 3 is respected.

## **CHAPTER VIII**

### **ORGANISATION OF ACCESS TO THE SYSTEM**

#### **Article 32**

##### **Third-party access**

1. **Contracting Parties** shall ensure the implementation of a system of third party access to the transmission and distribution systems based on published tariffs, applicable to all eligible customers and applied objectively and without discrimination between system users. **Contracting Parties** shall

ensure that those tariffs, or the methodologies underlying their calculation, are approved prior to their entry into force in accordance with Article 37 and that those tariffs, and the methodologies - where only methodologies are approved - are published prior to their entry into force.

2. The transmission or distribution system operator may refuse access where it lacks the necessary capacity. Duly substantiated reasons must be given for such refusal, in particular having regard to Article 3, and based on objective and technically and economically justified criteria. The regulatory authorities where **Contracting Parties** have so provided or **Contracting Parties** shall ensure that those criteria are consistently applied and that the system user who has been refused access can make use of a dispute settlement procedure. The regulatory authorities shall also ensure, where appropriate and when refusal of access takes place, that the transmission or distribution system operator provides relevant information on measures that would be necessary to reinforce the network. The party requesting such information may be charged a reasonable fee reflecting the cost of providing such information.

### **Article 33**

#### **Market opening and reciprocity**

1. **Contracting Parties** shall ensure that the eligible customers comprise<sup>6</sup>:

- (a) <...>;
- (b) **from 1 January 2008**, all non-household customers;
- (c) **from 1 January 2015**, all customers.

2. To avoid imbalance in the opening of electricity markets:

- (a) contracts for the supply of electricity with an eligible customer in the system of another **Contracting Party** shall not be prohibited if the customer is considered as eligible in both systems involved; and
- (b) <...>

### **Article 34**

#### **Direct lines**

1. **Contracting Parties** shall take the measures necessary to enable:

- (a) all electricity producers and electricity supply undertakings established within their territory to supply their own premises, subsidiaries and eligible customers through a direct line; and
- (b) all eligible customers within their territory to be supplied through a direct line by a producer and supply undertakings.

2. **Contracting Parties** shall lay down the criteria for the grant of authorisations for the construction of direct lines in their territory. Those criteria shall be objective and non-discriminatory.

3. The possibility of supplying electricity through a direct line as referred to in paragraph 1 of this

<sup>6</sup> According to Article 17(2) of Decision 2011/02/MC-EnC, the following deadlines 'shall apply without prejudice to special deadlines agreed in the Protocols of Accession to the Energy Community'.

Article shall not affect the possibility of contracting electricity in accordance with Article 32.

4. **Contracting Parties** may issue an authorisation to construct a direct line subject either to the refusal of system access on the basis, as appropriate, of Article 32 or to the opening of a dispute settlement procedure under Article 37.

5. **Contracting Parties** may refuse to authorise a direct line if the granting of such an authorisation would obstruct the provisions of Article 3. Duly substantiated reasons shall be given for such refusal.

## CHAPTER IX

### NATIONAL REGULATORY AUTHORITIES

#### *Article 35*

#### **Designation and independence of regulatory authorities**

1. Each **Contracting Party** shall designate a single national regulatory authority at national level.
2. Paragraph 1 of this Article shall be without prejudice to the designation of other regulatory authorities at regional level within **Contracting Parties**, provided that there is one senior representative for representation and contact purposes at **Energy Community** level.
3. By way of derogation from paragraph 1 of this Article, a **Contracting Party** may designate regulatory authorities for small systems on a geographically separate region whose consumption, in 2008, accounted for less than 3% of the total consumption of the **Contracting Party** of which it is part. This derogation shall be without prejudice to the appointment of one senior representative for representation and contact purposes at **Energy Community** level.
4. **Contracting Parties** shall guarantee the independence of the regulatory authority and shall ensure that it exercises its powers impartially and transparently. For this purpose, **Contracting Party** shall ensure that, when carrying out the regulatory tasks conferred upon it by this Directive and related legislation, the regulatory authority:
  - (a) is legally distinct and functionally independent from any other public or private entity;
  - (b) ensures that its staff and the persons responsible for its management:
    - (i) act independently from any market interest; and
    - (ii) do not seek or take direct instructions from any government or other public or private entity when carrying out the regulatory tasks. This requirement is without prejudice to close cooperation, as appropriate, with other relevant national authorities or to general policy guidelines issued by the government not related to the regulatory powers and duties under Article 37.
5. In order to protect the independence of the regulatory authority, **Contracting Parties** shall in particular ensure that:
  - (a) the regulatory authority can take autonomous decisions, independently from any political body, and has separate annual budget allocations, with autonomy in the implementation of the allocated budget, and adequate human and financial resources to carry out its duties; and

(b) the members of the board of the regulatory authority or, in the absence of a board, the regulatory authority's top management are appointed for a fixed term of five up to seven years, renewable once.

In regard to point (b) of the first subparagraph, **Contracting Parties** shall ensure an appropriate rotation scheme for the board or the top management. The members of the board or, in the absence of a board, members of the top management may be relieved from office during their term only if they no longer fulfil the conditions set out in this Article or have been guilty of misconduct under national law.

### **Article 36**

#### **General objectives of the regulatory authority**

In carrying out the regulatory tasks specified in this Directive, the regulatory authority shall take all reasonable measures in pursuit of the following objectives within the framework of their duties and powers as laid down in Article 37, in close consultation with other relevant national authorities including competition authorities, as appropriate, and without prejudice to their competencies:

(a) promoting, in close cooperation with the **Energy Community Regulatory Board**, regulatory authorities of other **Contracting Parties** and the **Energy Community Secretariat**, a competitive, secure and environmentally sustainable internal market in electricity within the **Energy Community**, and effective market opening for all customers and suppliers in the **Energy Community** and ensuring appropriate conditions for the effective and reliable operation of electricity networks, taking into account long-term objectives;

(b) developing competitive and properly functioning regional markets within the **Energy Community** in view of the achievement of the objectives referred to in point (a);

(c) eliminating restrictions on trade in electricity between **Contracting Parties**, including developing appropriate cross-border transmission capacities to meet demand and enhancing the integration of national markets which may facilitate electricity flows across the **Energy Community**;

(d) helping to achieve, in the most cost-effective way, the development of secure, reliable and efficient non-discriminatory systems that are consumer oriented, and promoting system adequacy and, in line with general energy policy objectives, energy efficiency as well as the integration of large and small-scale production of electricity from renewable energy sources and distributed generation in both transmission and distribution networks;

(e) facilitating access to the network for new generation capacity, in particular removing barriers that could prevent access for new market entrants and of electricity from renewable energy sources;

(f) ensuring that system operators and system users are granted appropriate incentives, in both the short and the long term, to increase efficiencies in system performance and foster market integration;

(g) ensuring that customers benefit through the efficient functioning of their national market, promoting effective competition and helping to ensure consumer protection;

(h) helping to achieve high standards of universal and public service in electricity supply, contributing to the protection of vulnerable customers and contributing to the compatibility of necessary data exchange processes for customer switching.

### Article 37

#### Duties and powers of the regulatory authority

1. The regulatory authority shall have the following duties:

- (a) fixing or approving, in accordance with transparent criteria, transmission or distribution tariffs or their methodologies;
- (b) ensuring compliance of transmission and distribution system operators and, where relevant, system owners, as well as of any electricity undertakings, with their obligations under this Directive and other relevant **Energy Community** legislation, including as regards cross-border issues;
- (c) cooperating in regard to cross-border issues with the regulatory authority or authorities of the **Contracting Parties** concerned and with the **Energy Community Regulatory Board**;
- (d) complying with, and implementing, any relevant legally binding decisions of the **Energy Community Regulatory Board** <...>;
- (e) reporting annually on its activity and the fulfilment of its duties to the relevant authorities of the **Contracting Parties**, **Energy Community Regulatory Board** and the **Energy Community Secretariat**. Such reports shall cover the steps taken and the results obtained as regards each of the tasks listed in this Article;
- (f) ensuring that there are no cross-subsidies between transmission, distribution, and supply activities;
- (g) monitoring investment plans of the transmission system operators, and providing in its annual report an assessment of the **investment plans of the transmission system operators** <...>; such assessment may, which may include recommendations to amend those investment plans;
- (h) monitoring compliance with and reviewing the past performance of network security and reliability rules and setting or approving standards and requirements for quality of service and supply or contributing thereto together with other competent authorities;
- (i) monitoring the level of transparency, including of wholesale prices, and ensuring compliance of electricity undertakings with transparency obligations;
- (j) monitoring the level and effectiveness of market opening and competition at wholesale and retail levels, including on electricity exchanges, prices for household customers including prepayment systems, switching rates, disconnection rates, charges for and the execution of maintenance services, and complaints by household customers, as well as any distortion or restriction of competition, including providing any relevant information, and bringing any relevant cases to the relevant competition authorities;
- (k) monitoring the occurrence of restrictive contractual practices, including exclusivity clauses which may prevent large non-household customers from contracting simultaneously with more than one supplier or restrict their choice to do so, and, where appropriate, informing the national competition authorities of such practices;
- (l) respecting contractual freedom with regard to interruptible supply contracts and with regard to long-term contracts provided that they are compatible with Energy Community law;
- (m) monitoring the time taken by transmission and distribution system operators to make connections and repairs;

- (n) helping to ensure, together with other relevant authorities, that the consumer protection measures, including those set out in Annex I, are effective and enforced;
- (o) publishing recommendations, at least annually, in relation to compliance of supply prices with Article 3, and providing these to the competition authorities, where appropriate;
- (p) ensuring access to customer consumption data, the provision, for optional use, of an easily understandable harmonised format at national level for consumption data, and prompt access for all customers to such data under point (h) of Annex I;
- (q) monitoring the implementation of rules relating to the roles and responsibilities of transmission system operators, distribution system operators, suppliers and customers and other market parties pursuant to Regulation (EC) No 714/2009;
- (r) monitoring investment in generation capacities in relation to security of supply;
- (s) monitoring technical cooperation between **Energy Community** and third-country transmission system operators;
- (t) monitoring the implementation of safeguards measures as referred to in Article 42; and
- (u) contributing to the compatibility of data exchange processes for the most important market processes at regional level.

2. Where a **Contracting Party** has so provided, the monitoring duties set out in paragraph 1 may be carried out by other authorities than the regulatory authority. In such a case, the information resulting from such monitoring shall be made available to the regulatory authority as soon as possible.

While preserving their independence, without prejudice to their own specific competencies and consistent with the principles of better regulation, the regulatory authority shall, as appropriate, consult transmission system operators and, as appropriate, closely cooperate with other relevant national authorities when carrying out the duties set out in paragraph 1.

Any approvals given by a regulatory authority or the **Energy Community Regulatory Board** under this Directive are without prejudice to any duly justified future use of its powers by the regulatory authority under this Article or to any penalties imposed by other relevant authorities <...>.

3. In addition to the duties conferred upon it under paragraph 1 of this Article, when an independent system operator has been designated under Article 13, the regulatory authority shall:

- (a) monitor the transmission system owner's and the independent system operator's compliance with their obligations under this Article, and issue penalties for non-compliance in accordance with paragraph 4(d);
- (b) monitor the relations and communications between the independent system operator and the transmission system owner so as to ensure compliance of the independent system operator with its obligations, and in particular approve contracts and act as a dispute settlement authority between the independent system operator and the transmission system owner in respect of any complaint submitted by either party pursuant to paragraph 11;
- (c) without prejudice to the procedure under Article 13(2)(c), for the first ten-year network development plan, approve the investments planning and the multi-annual network development plan presented annually by the independent system operator;
- (d) ensure that network access tariffs collected by the independent system operator include remuneration for the network owner or network owners, which provides for adequate remuneration of

the network assets and of any new investments made therein, provided they are economically and efficiently incurred;

(e) have the powers to carry out inspections, including unannounced inspections, at the premises of transmission system owner and independent system operator; and

(f) monitor the use of congestion charges collected by the independent system operator in accordance with Article 16(6) of Regulation (EC) No 714/2009.

4. **Contracting Parties** shall ensure that regulatory authorities are granted the powers enabling them to carry out the duties referred to in paragraphs 1, 3 and 6 in an efficient and expeditious manner. For this purpose, the regulatory authority shall have at least the following powers:

(a) to issue binding decisions on electricity undertakings;

(b) to carry out investigations into the functioning of the electricity markets, and to decide upon and impose any necessary and proportionate measures to promote effective competition and ensure the proper functioning of the market. Where appropriate, the regulatory authority shall also have the power to cooperate with the national competition authority and the financial market regulators or the **Energy Community Secretariat** in conducting an investigation relating to competition law;

(c) to require any information from electricity undertakings relevant for the fulfilment of its tasks, including the justification for any refusal to grant third-party access, and any information on measures necessary to reinforce the network;

(d) to impose effective, proportionate and dissuasive penalties on electricity undertakings not complying with their obligations under this Directive or any relevant legally binding decisions of the regulatory authority or the **Energy Community Regulatory Board**, or to propose that a competent court impose such penalties. This shall include the power to impose or propose the imposition of penalties of up to 10% of the annual turnover of the transmission system operator on the transmission system operator or of up to 10% of the annual turnover of the vertically integrated undertaking on the vertically integrated undertaking, as the case may be, for non-compliance with their respective obligations pursuant to this Directive; and

(e) appropriate rights of investigations and relevant powers of instructions for dispute settlement under paragraphs 11 and 12.

5. In addition to the duties and powers conferred on it under paragraphs 1 and 4 of this Article, when a transmission system operator has been designated in accordance with Chapter V, the regulatory authority shall be granted at least the following duties and powers:

(a) to issue penalties in accordance with paragraph 4(d) for discriminatory behaviour in favour of the vertically integrated undertaking;

(b) to monitor communications between the transmission system operator and the vertically integrated undertaking so as to ensure compliance of the transmission system operator with its obligations;

(c) to act as dispute settlement authority between the vertically integrated undertaking and the transmission system operator in respect of any complaint submitted pursuant to paragraph 11;

(d) to monitor commercial and financial relations including loans between the vertically integrated undertaking and the transmission system operator;

(e) to approve all commercial and financial agreements between the vertically integrated undertaking and the transmission system operator on the condition that they comply with market conditions;

(f) to request justification from the vertically integrated undertaking when notified by the compliance officer in accordance with Article 21(4). Such justification shall, in particular, include evidence to the end that no discriminatory behaviour to the advantage of the vertically integrated undertaking has occurred;

(g) to carry out inspections, including unannounced ones, on the premises of the vertically integrated undertaking and the transmission system operator; and

(h) to assign all or specific tasks of the transmission system operator to an independent system operator appointed in accordance with Article 13 in case of a persistent breach by the transmission system operator of its obligations under this Directive, in particular in case of repeated discriminatory behaviour to the benefit of the vertically integrated undertaking.

6. The regulatory authorities shall be responsible for fixing or approving sufficiently in advance of their entry into force at least the methodologies used to calculate or establish the terms and conditions for:

(a) connection and access to national networks, including transmission and distribution tariffs or their methodologies. Those tariffs or methodologies shall allow the necessary investments in the networks to be carried out in a manner allowing those investments to ensure the viability of the networks;

(b) the provision of balancing services which shall be performed in the most economic manner possible and provide appropriate incentives for network users to balance their input and off-takes. The balancing services shall be provided in a fair and non-discriminatory manner and be based on objective criteria; and

(c) access to cross-border infrastructures, including the procedures for the allocation of capacity and congestion management.

7. The methodologies or the terms and conditions referred to in paragraph 6 shall be published.

8. In fixing or approving the tariffs or methodologies and the balancing services, the regulatory authorities shall ensure that transmission and distribution system operators are granted appropriate incentive, over both the short and long term, to increase efficiencies, foster market integration and security of supply and support the related research activities.

9. The regulatory authorities shall monitor congestion management of national electricity systems including interconnectors, and the implementation of congestion management rules. To that end, transmission system operators or market operators shall submit their congestion management rules, including capacity allocation, to the national regulatory authorities. National regulatory authorities may request amendments to those rules.

10. Regulatory authorities shall have the authority to require transmission and distribution system operators, if necessary, to modify the terms and conditions, including tariffs or methodologies referred to in this Article, to ensure that they are proportionate and applied in a non-discriminatory manner. In the event of delay in the fixing of transmission and distribution tariffs, regulatory authorities shall have the power to fix or approve provisional transmission and distribution tariffs or methodologies and to decide on the appropriate compensatory measures if the final transmission and distribution tariffs or methodologies deviate from those provisional tariffs or methodologies.

11. Any party having a complaint against a transmission or distribution system operator in relation to that operator's obligations under this Directive may refer the complaint to the regulatory authority

which, acting as dispute settlement authority, shall issue a decision within a period of two months after receipt of the complaint. That period may be extended by two months where additional information is sought by the regulatory authority. That extended period may be further extended with the agreement of the complainant. The regulatory authority's decision shall have binding effect unless and until overruled on appeal.

12. Any party who is affected and who has a right to complain concerning a decision on methodologies taken pursuant to this Article or, where the regulatory authority has a duty to consult, concerning the proposed tariffs or methodologies, may, at the latest within two months, or a shorter time period as provided by **Contracting Parties**, following publication of the decision or proposal for a decision, submit a complaint for review. Such a complaint shall not have suspensive effect.

13. **Contracting Parties** shall create appropriate and efficient mechanisms for regulation, control and transparency so as to avoid any abuse of a dominant position, in particular to the detriment of consumers, and any predatory behaviour. Those mechanisms shall take account of the provisions of the Treaty, and in particular Article 82 thereof.<sup>7</sup>

14. **Contracting Parties** shall ensure that the appropriate measures are taken, including administrative action or criminal proceedings in conformity with their national law, against the natural or legal persons responsible where confidentiality rules imposed by this Directive have not been respected.

15. Complaints referred to in paragraphs 11 and 12 shall be without prejudice to the exercise of rights of appeal under national law.

16. Decisions taken by regulatory authorities shall be fully reasoned and justified to allow for judicial review. The decisions shall be available to the public while preserving the confidentiality of commercially sensitive information.

17. **Contracting Parties** shall ensure that suitable mechanisms exist at national level under which a party affected by a decision of a regulatory authority has a right of appeal to a body independent of the parties involved and of any government.

### **Article 38**

#### **Regulatory regime for cross-border issues**

1. Regulatory authorities shall closely consult and cooperate with each other, and shall provide each other and the **Energy Community Regulatory Board** with any information necessary for the fulfilment of their tasks under this Directive. In respect of the information exchanged, the receiving authority shall ensure the same level of confidentiality as that required of the originating authority.

2. Regulatory authorities shall cooperate at least at a regional level to:

(a) foster the creation of operational arrangements in order to enable an optimal management of the network, promote joint electricity exchanges and the allocation of cross-border capacity, and to enable an adequate level of interconnection capacity, including through new interconnection, within the region and between regions to allow for development of effective competition and improvement of security of supply, without discriminating between supply undertakings in different **Contracting Parties**;

<sup>7</sup> In the Energy Community Treaty, Article 82 of the EC Treaty is incorporated through Article 18 and Annex III.

- (b) coordinate the development of all network codes for the relevant transmission system operators and other market actors; and
- (c) coordinate the development of the rules governing the management of congestion.
3. National regulatory authorities shall have the right to enter into cooperative arrangements with each other to foster regulatory cooperation.
4. The actions referred to in paragraph 2 shall be carried out, as appropriate, in close consultation with other relevant national authorities and without prejudice to their specific competencies.
5. <...>

### **Article 39**

#### **Compliances with the Guidelines<sup>8</sup>**

**The Energy Community shall endeavour to apply the Guidelines adopted by the European Commission under Directive 2009/72/EC, [and] Regulation (EC) No 714/2009 <...>.**

**These Guidelines, which may need to be adapted to the institutional framework of the Energy Community, shall be adopted by the Permanent High Level Group, following the procedure laid down in Article 79 of the Treaty.**

**The Permanent High Level Group shall adopt a Procedural Act on application of this article.<sup>9</sup>**

### **Article 40**

#### **Record keeping**

1. **Contracting Parties** shall require supply undertakings to keep at the disposal of the national authorities, including the national regulatory authority, the national competition authorities and of the **Energy Community Secretariat**, for the fulfilment of their tasks, for at least five years, the relevant data relating to all transactions in electricity supply contracts and electricity derivatives with wholesale customers and transmission system operators.
2. The data shall include details on the characteristics of the relevant transactions such as duration, delivery and settlement rules, the quantity, the dates and times of execution and the transaction prices and means of identifying the wholesale customer concerned, as well as specified details of all unsettled electricity supply contracts and electricity derivatives.
3. The regulatory authority may decide to make available to market participants elements of that information provided that commercially sensitive information on individual market players or individual transactions is not released <...>.
4. <...>
5. With respect to transactions in electricity derivatives of supply undertakings with wholesale customers and transmission system operators, this Article shall apply only once **the Permanent High**

<sup>8</sup> Not applicable, according to Article 21 of Decision 2011/02/MC-EnC. The following text corresponds to Article 27 of Decision 2011/02/MC-EnC.

<sup>9</sup> Procedural Act 01/2012/PHLG-EnC of Permanent High Level Group of 21 June 2012 laying down the rules governing the adoption of Guidelines and Network Codes in the Energy Community was adopted on 21 June 2012.

**Level Group** has endorsed the Guidelines referred to in paragraph 4.

6. <...>

7. <...>

## CHAPTER X

### RETAIL MARKETS

#### *Article 41*

##### **Retail markets**

In order to facilitate the emergence of well functioning and transparent retail markets in the **Energy Community, Contracting Parties** shall ensure that the roles and responsibilities of transmission system operators, distribution system operators, supply undertakings and customers and if necessary other market participants are defined with respect to contractual arrangements, commitment to customers, data exchange and settlement rules, data ownership and metering responsibility.

Those rules shall be made public, be designed with the aim to facilitate customers' and suppliers' access to networks, and they shall be subject to review by the regulatory authorities or other relevant national authorities.

Large non-household customers shall have the right to contract simultaneously with several suppliers.

## CHAPTER XI

### FINAL PROVISIONS

#### *Article 42*

##### **Safeguard measures**

In the event of a sudden crisis in the energy market and where the physical safety or security of persons, apparatus or installations or system integrity is threatened, a **Contracting Party** may temporarily take the necessary safeguard measures.

**Instead of the second and third subparagraphs, Articles 36 to 39 of the Energy Community Treaty apply.**

### **Article 43**

#### **Level playing field**

1. Measures that the **Contracting Parties** may take pursuant to this Directive in order to ensure a level playing field shall be compatible with the Treaty, notably Article 30 thereof,<sup>10</sup> and with **Energy Community law**.
2. The measures referred to in paragraph 1 shall be proportionate, non-discriminatory and transparent. Those measures may be put into effect only **following notification to the Secretariat, which shall issue an opinion**.
3. The **Energy Community Secretariat** shall act on the notification referred to in paragraph 2 within two months of the receipt of the notification. That period shall begin on the day following receipt of the complete information. In the event that the **Energy Community Secretariat** has not acted within that two-month period, it shall be deemed not to have raised objections to the notified measures.

### **Article 44**

#### **Derogations**

1. <...>
2. <...> For the purposes of Article 9(1)(b), the notion “undertaking performing any of the functions of generation or supply” shall not include final customers who perform any of the functions of generation and/or supply of electricity, either directly or via undertakings over which they exercise control, either individually or jointly, provided that the final customers including their shares of the electricity produced in controlled undertakings are, on an annual average, net consumers of electricity and provided that the economic value of the electricity they sell to third parties is insignificant in proportion to their other business operations.

### **Article 45**

#### **Review procedure**

<...>

### **Article 46**

#### **Committee**

<...>

---

<sup>10</sup> Procedural Act 01/2012/PHLG-EnC of Permanent High Level Group of 21 June 2012 laying down the rules governing the adoption of Guidelines and Network Codes in the Energy Community was adopted on 21 June 2012.

**Article 47**  
**Reporting<sup>11</sup>**

1. The Secretariat shall monitor and review application of this Decision in the Contracting Parties.

2. The Secretariat shall submit an overall progress report to the Ministerial Council for the first time by 30 June 2012, and thereafter on an annual basis. The progress report shall reflect the progress made on creating a complete and fully operational internal market in electricity and gas and the obstacles that remain in this respect, including aspects of market dominance, market concentration, predatory or anti-competitive behaviour and the effect thereof in terms of market distortion. It shall in particular consider:

- the implementation by each Contracting Party of the provisions on unbundling, certification and on independence of the national regulatory authorities and application of these provisions in practice,
- the existence of non-discriminatory network access,
- effective regulation,
- the development of interconnection infrastructure and the security of supply situation in the Energy Community,
- the extent to which the full benefits of the opening of markets are accruing to small enterprises and household customers, notably with respect to public service and universal service standards,
- the extent to which markets are in practice open to effective competition, including aspects of market dominance, market concentration and predatory or anti-competitive behaviour,
- the extent to which customers are actually switching suppliers and renegotiating tariffs,
- price developments, including supply prices, in relation to the degree of opening of the markets, and
- the experience gained from application of this Decision as far as effective independence of system operators in vertically integrated undertakings is concerned and whether other measures in addition to functional independence and separation of accounts have been developed which have effects equivalent to legal unbundling.

3. The Secretariat shall present a report to the Ministerial Council for the first time by 30 June 2012, and thereafter on an annual basis, summarising the opinions issued by the Secretariat in application of the acts referred to in Article 1, as adapted by this Decision.

**Article 48**  
**Repeal**

<...>

<sup>11</sup> The text displayed here corresponds to Article 31 of Decision 2011/02/MC-EnC.

### **Article 49**

#### **Implementation of the energy acquis<sup>12</sup>**

1. Each Contracting Party shall bring into force the laws, regulations and administrative provisions necessary to comply with Directive 2009/72/EC <...>, as adapted by this Decision, by 1 January 2015. They shall forthwith inform the Energy Community Secretariat thereof.

The Contracting Parties<sup>13</sup> shall apply the measures referred to in the previous paragraph with effect from 1 January 2015 with the following exceptions:

– Article 11 of Directive 2009/72/EC, which they shall apply from 1 January 2017;

– <...>

2. The Contracting Parties shall communicate to the Energy Community Secretariat the text of the main provisions of national law which they adopt in the field covered by this Decision.

### **Articles 50 and 51**

#### **Entry into force and Addressees**

This Decision [2011/02/MC-EnC] enters into force upon its adoption and is addressed to the Contracting Parties.<sup>14</sup>

---

<sup>12</sup> The text displayed here corresponds to Article 3 of Decision 2011/02/MC-EnC.

<sup>13</sup> In accordance with the Accession Protocol, the corresponding date for Georgia is 31 December 2018.

<sup>14</sup> The text displayed here corresponds to Article 32 of Decision 2011/02/MC-EnC.

## ANNEX I

### MEASURES ON CONSUMER PROTECTION

#### 1. Without prejudice to Energy Community rules on consumer protection <...> the measures referred to in Article 3 are to ensure that customers:

(a) have a right to a contract with their electricity service provider that specifies:

- the identity and address of the supplier,
- the services provided, the service quality levels offered, as well as the time for the initial connection,
- the types of maintenance service offered,
- the means by which up-to-date information on all applicable tariffs and maintenance charges may be obtained,
- the duration of the contract, the conditions for renewal and termination of services and of the contract and whether withdrawal from the contract without charge is permitted,
- any compensation and the refund arrangements which apply if contracted service quality levels are not met, including inaccurate and delayed billing,
- the method of initiating procedures for settlement of disputes in accordance with point (f),
- information relating to consumer rights, including on the complaint handling and all of the information referred to in this point, clearly communicated through billing or the electricity undertaking's web site,

Conditions shall be fair and well-known in advance. In any case, this information should be provided prior to the conclusion or confirmation of the contract. Where contracts are concluded through intermediaries, the information relating to the matters set out in this point shall also be provided prior to the conclusion of the contract;

(b) are given adequate notice of any intention to modify contractual conditions and are informed about their right of withdrawal when the notice is given. Service providers shall notify their subscribers directly of any increase in charges, at an appropriate time no later than one normal billing period after the increase comes into effect in a transparent and comprehensible manner. The **Contracting Parties** shall ensure that customers are free to withdraw from contracts if they do not accept the new conditions notified to them by their electricity service provider;

(c) receive transparent information on applicable prices and tariffs and on standard terms and conditions, in respect of access to and use of electricity services;

(d) are offered a wide choice of payment methods, which do not unduly discriminate between customers. Prepayment systems shall be fair and adequately reflect likely consumption. Any difference in terms and conditions shall reflect the costs to the supplier of the different payment systems. General terms and conditions shall be fair and transparent. They shall be given in clear and comprehensible language and shall not include non-contractual barriers to the exercise of customers' rights, for example excessive contractual documentation. Customers shall be protected against unfair or misleading selling methods;

(e) are not charged for changing supplier;

(f) benefit from transparent, simple and inexpensive procedures for dealing with their complaints. In particular, all consumers shall have the right to a good standard of service and complaint handling by their electricity service provider. Such out-of-court dispute settlements procedures shall enable disputes to be settled fairly and promptly, preferably within three months, with provision, where warranted, for a system of reimbursement and/or compensation. They should, wherever possible, be in line with the principles set out in Commission Recommendation 98/257/EC of 30 March 1998 on the principles applicable to the bodies responsible for out-of-court settlement of consumer disputes;

(g) when having access to universal service under the provisions adopted by Contracting Parties pursuant to Article 3(3), are informed about their rights regarding universal service;

(h) have at their disposal their consumption data, and shall be able to, by explicit agreement and free of charge, give any registered supply undertaking access to its metering data. The party responsible for data management shall be obliged to give those data to the undertaking. **Contracting Parties** shall define a format for the data and a procedure for suppliers and consumers to have access to the data. No additional costs shall be charged to the consumer for that service;

(i) are properly informed of actual electricity consumption and costs frequently enough to enable them to regulate their own electricity consumption. That information shall be given by using a sufficient time frame, which takes account of the capability of customer's metering equipment and the electricity product in question. Due account shall be taken of the cost-efficiency of such measures. No additional costs shall be charged to the consumer for that service;

(j) receive a final closure account following any change of electricity supplier no later than six weeks after the change of supplier has taken place.

2. **Contracting Parties** shall ensure the implementation of intelligent metering systems that shall assist the active participation of consumers in the electricity supply market. The implementation of those metering systems may be subject to an economic assessment of all the long-term costs and benefits to the market and the individual consumer or which form of intelligent metering is economically reasonable and cost-effective and which timeframe is feasible for their distribution.

Such assessment shall take place by **1 January 2014**.

Subject to that assessment, **Contracting Parties** or any competent authority they designate shall prepare a timetable with a target of up to 10 years for the implementation of intelligent metering systems.

Where roll-out of smart meters is assessed positively, at least 80% of consumers shall be equipped with intelligent metering systems by 2020.

The **Contracting Parties**, or any competent authority they designate, shall ensure the interoperability of those metering systems to be implemented within their territories and shall have due regard to the use of appropriate standards and best practice and the importance of the development of the internal market in electricity.

## **REGULATION (EC) 714/2009 of 13 July 2009 on conditions for access to the network for cross-border exchanges in electricity and repealing Regulation (EC) 1228/2003**

Incorporated and adapted by Ministerial Council Decision 2011/02/MC-EnC of 6 October 2011 on the implementation of Directive 2009/72/EC, Directive 2009/73/EC, Regulation (EC) 714/2009 and Regulation (EC) 715/2009 and amending Articles 11 and 59 of the Energy Community Treaty.

*The adaptations made by Ministerial Council Decision 2011/02/MC-EnC are highlighted in **bold and blue**.*

Whereas:

(1) The internal market in electricity, which has been progressively implemented since 1999, aims to deliver real choice for all consumers in the Community, be they citizens or businesses, new business opportunities and more cross-border trade, so as to achieve efficiency gains, competitive prices and higher standards of service, and to contribute to security of supply and sustainability.

(2) Directive 2003/54/EC of the European Parliament and of the Council of 26 June 2003 concerning common rules for the internal market in electricity and Regulation (EC) No 1228/2003 of the European Parliament and of the Council of 26 June 2003 on conditions for access to the network for cross-border exchanges in electricity have made significant contributions towards the creation of such an internal market in electricity.

(3) However, at present, there are obstacles to the sale of electricity on equal terms, without discrimination or disadvantage in the Community. In particular, non-discriminatory network access and an equally effective level of regulatory supervision do not yet exist in each Member State, and isolated markets persist.

(4) The Communication of the Commission of 10 January 2007 entitled "An Energy Policy for Europe" highlighted the importance of completing the internal market in electricity and creating a level playing field for all electricity undertakings in the Community. The Communications of the Commission of 10 January 2007 entitled "Prospects for the internal gas and electricity market" and "Inquiry pursuant to Article 17 of Regulation (EC) No 1/2003 into the European gas and electricity sectors (Final Report)" demonstrated that the present rules and measures neither provide the necessary framework nor provide for the creation of interconnection capacities to achieve the objective of a well-functioning, efficient and open internal market.

(5) In addition to thoroughly implementing the existing regulatory framework, the regulatory framework for the internal market in electricity set out in Regulation (EC) No 1228/2003 should be adapted in line with those communications.

(6) In particular, increased cooperation and coordination among transmission system operators is required to create network codes for providing and managing effective and transparent access to the transmission networks across borders, and to ensure coordinated and sufficiently forward-looking planning and sound technical evolution of the transmission system in the Community, including the creation of interconnection capacities, with due regard to the environment. Those network codes should be in line with framework guidelines, which are non-binding in nature (framework guidelines) and which are developed by the Agency for the Cooperation of Energy Regulators established

by Regulation (EC) No 713/2009 of the European Parliament and of the Council of 13 July 2009 establishing an Agency for the Cooperation of Energy Regulators (the Agency). The Agency should have a role in reviewing, based on matters of fact, draft network codes, including their compliance with the framework guidelines, and it should be enabled to recommend them for adoption by the Commission. The Agency should assess proposed amendments to the network codes and it should be enabled to recommend them for adoption by the Commission. Transmission system operators should operate their networks in accordance with those network codes.

(7) In order to ensure optimal management of the electricity transmission network and to allow trading and supplying electricity across borders in the Community, a European Network of Transmission System Operators for Electricity (the ENTSO for Electricity), should be established. The tasks of the ENTSO for Electricity should be carried out in compliance with Community competition rules which remain applicable to the decisions of the ENTSO for Electricity. The tasks of the ENTSO for Electricity should be well-defined and its working method should ensure efficiency, transparency and the representative nature of the ENTSO for Electricity. The network codes prepared by the ENTSO for Electricity are not intended to replace the necessary national network codes for non-cross-border issues. Given that more effective progress may be achieved through an approach at regional level, transmission system operators should set up regional structures within the overall cooperation structure, whilst ensuring that results at regional level are compatible with network codes and non-binding ten-year network development plans at Community level. Member States should promote cooperation and monitor the effectiveness of the network at regional level. Cooperation at regional level should be compatible with progress towards a competitive and efficient internal market in electricity.

(8) All market participants have an interest in the work expected of the ENTSO for Electricity. An effective consultation process is therefore essential and existing structures that are set up to facilitate and streamline the consultation process, such as the Union for the Coordination of Transmission of Electricity, national regulators or the Agency, should play an important role.

(9) In order to ensure greater transparency regarding the entire electricity transmission network in the Community, the ENTSO for Electricity should draw up, publish and regularly update a non-binding Community-wide ten-year network development plan (Community-wide network development plan). Viable electricity transmission networks and necessary regional interconnections, relevant from a commercial or security of supply point of view, should be included in that network development plan.

(10) This Regulation should lay down basic principles with regard to tariffication and capacity allocation, whilst providing for the adoption of Guidelines detailing further relevant principles and methodologies, in order to allow rapid adaptation to changed circumstances.

(11) In an open, competitive market, transmission system operators should be compensated for costs incurred as a result of hosting cross-border flows of electricity on their networks by the operators of the transmission systems from which cross-border flows originate and the systems where those flows end.

(12) Payments and receipts resulting from compensation between transmission system operators should be taken into account when setting national network tariffs.

(13) The actual amount payable for cross-border access to the system can vary considerably, depending on the transmission system operator involved and as a result of differences in the structure of the tariffication systems applied in Member States. A certain degree of harmonisation is therefore

necessary in order to avoid distortions of trade.

(14) A proper system of long-term locational signals is necessary, based on the principle that the level of the network access charges should reflect the balance between generation and consumption of the region concerned, on the basis of a differentiation of the network access charges on producers and/or consumers.

(15) It would not be appropriate to apply distance-related tariffs or, provided appropriate locational signals are in place, a specific tariff to be paid only by exporters or importers in addition to the general charge for access to the national network.

(16) The precondition for effective competition in the internal market in electricity is non-discriminatory and transparent charges for network use including interconnecting lines in the transmission system. The available capacity of those lines should be set at the maximum levels consistent with the safety standards of secure network operation.

(17) It is important to avoid distortion of competition resulting from the differing safety, operational and planning standards used by transmission system operators in Member States. Moreover, there should be transparency for market participants concerning available transfer capacities and the security, planning and operational standards that affect the available transfer capacities.

(18) Market monitoring undertaken over recent years by the national regulatory authorities and by the Commission has shown that current transparency requirements and rules on access to infrastructure are not sufficient to secure a genuine, well-functioning, open and efficient internal market in electricity.

(19) Equal access to information on the physical status and efficiency of the system is necessary to enable all market participants to assess the overall demand and supply situation and identify the reasons for movements in the wholesale price. This includes more precise information on electricity generation, supply and demand including forecasts, network and interconnection capacity, flows and maintenance, balancing and reserve capacity.

(20) To enhance trust in the market, its participants need to be sure that those engaging in abusive behaviour can be subject to effective, proportionate and dissuasive penalties. The competent authorities should be given the competence to investigate effectively allegations of market abuse. To that end, it is necessary that competent authorities have access to data that provides information on operational decisions made by supply undertakings. In the electricity market, many relevant decisions are made by the generators, which should keep information in relation thereto available to and easily accessible by the competent authorities for a fixed period of time. The competent authorities should, furthermore, regularly monitor the compliance of the transmission system operators with the rules. Small generators with no real ability to distort the market should be exempt from that obligation.

(21) There should be rules on the use of revenues flowing from congestion-management procedures, unless the specific nature of the interconnector concerned justifies an exemption from those rules.

(22) The management of congestion problems should provide correct economic signals to transmission system operators and market participants and should be based on market mechanisms.

(23) Investments in major new infrastructure should be promoted strongly while ensuring the proper functioning of the internal market in electricity. In order to enhance the positive effect of exempted direct current interconnectors on competition and security of supply, market interest during the project-planning phase should be tested and congestion-management rules should be adopted.

Where direct current interconnectors are located in the territory of more than one Member State, the Agency should handle as a last resort the exemption request in order to take better account of its cross-border implications and to facilitate its administrative handling. Moreover, given the exceptional risk profile of constructing those exempt major infrastructure projects, undertakings with supply and production interests should be able to benefit from a temporary derogation from the full unbundling rules for the projects concerned. Exemptions granted under Regulation (EC) No 1228/2003 continue to apply until the scheduled expiry date as decided in the granted exemption decision.

(24) To ensure the smooth functioning of the internal market in electricity, provision should be made for procedures which allow the adoption of decisions and Guidelines with regard, *inter alia*, to tariffication and capacity allocation by the Commission whilst ensuring the involvement of Member States' regulatory authorities in that process, where appropriate through their European association. Regulatory authorities, together with other relevant authorities in the Member States, have an important role to play in contributing to the proper functioning of the internal market in electricity.

(25) National regulatory authorities should ensure compliance with the rules contained in this Regulation and the Guidelines adopted pursuant thereto.

(26) The Member States and the competent national authorities should be required to provide relevant information to the Commission. Such information should be treated confidentially by the Commission. Where necessary, the Commission should have an opportunity to request relevant information directly from undertakings concerned, provided that the competent national authorities are informed.

(27) Member States should lay down rules on penalties applicable to infringements of the provisions of this Regulation and ensure that they are implemented. Those penalties must be effective, proportionate and dissuasive.

(28) The measures necessary for the implementation of this Regulation should be adopted in accordance with Council Decision 1999/468/EC of 28 June 1999 laying down the procedures for the exercise of implementing powers conferred on the Commission.

(29) In particular, the Commission should be empowered to establish or adopt the Guidelines necessary for providing the minimum degree of harmonisation required to achieve the aims of this Regulation. Since those measures are of general scope and are designed to amend non-essential elements of this Regulation, by supplementing it with new non-essential elements, they must be adopted in accordance with the regulatory procedure with scrutiny provided for in Article 5a of Decision 1999/468/EC.

(30) Since the objective of this Regulation, namely the provision of a harmonised framework for cross-border exchanges of electricity, cannot be sufficiently achieved by the Member States and can therefore be better achieved at Community level, the Community may adopt measures, in accordance with the principle of subsidiarity, as set out in Article 5 of the Treaty. In accordance with the principle of proportionality, as set out in that Article, this Regulation does not go beyond what is necessary in order to achieve that objective.

(31) Given the scope of the amendments that are being made herein to Regulation (EC) No 1228/2003, it is desirable, for reasons of clarity and rationalisation, that the provisions in question should be recast by bringing them all together in a single text in a new Regulation.

## **Article 1**

### **Subject-matter and scope**

This Regulation aims at:

- (a) setting fair rules for cross-border exchanges in electricity, thus enhancing competition within the internal market in electricity, taking into account the particular characteristics of national and regional markets. This will involve the establishment of a compensation mechanism for cross-border flows of electricity and the setting of harmonised principles on cross-border transmission charges and the allocation of available capacities of interconnections between national transmission systems;
- (b) facilitating the emergence of a well-functioning and transparent wholesale market with a high level of security of supply in electricity. It provides for mechanisms to harmonise the rules for cross-border exchanges in electricity.

## **Article 2**

### **Definitions**

1. For the purpose of this Regulation, the definitions contained in Article 2 of Directive 2009/72/EC of the European Parliament and of the Council of 13 July 2009 concerning common rules for the internal market in electricity apply, with the exception of the definition of “interconnector” which shall be replaced by the following:

- “interconnector” means a transmission line which crosses or spans a border between **Contracting Parties** and which connects the national transmission systems of the **Contracting Parties**.

2. The following definitions shall apply:

(a) “regulatory authorities” means the regulatory authorities referred to in Article 35(1) of Directive 2009/72/EC;

(b) “cross-border flow” means a physical flow of electricity on a transmission network of a **Contracting Party** that results from the impact of the activity of producers and/or consumers outside that **Contracting Party** on its transmission network;

(c) “congestion” means a situation in which an interconnection linking national transmission networks cannot accommodate all physical flows resulting from international trade requested by market participants, because of a lack of capacity of the interconnectors and/or the national transmission systems concerned;

(d) “declared export” means the dispatch of electricity in one **Contracting Party** on the basis of an underlying contractual arrangement to the effect that the simultaneous corresponding take-up (declared import) of electricity will take place in another **Contracting Party** or a third country;

(e) “declared transit” means a circumstance where a declared export of electricity occurs and where the nominated path for the transaction involves a country in which neither the dispatch nor the simultaneous corresponding take-up of the electricity will take place;

(f) “declared import” means the take-up of electricity in a **Contracting Party** or a third country simultaneously with the dispatch of electricity (declared export) in another **Contracting Party**;

(g) “new interconnector” means an interconnector not completed by **1 July 2007**.

For the purpose of the inter-transmission system operator compensation mechanism referred to in Article 13 only, where transmission networks of two or more **Contracting Parties** form part, in whole or in part, of a single control block, the control block as a whole shall be considered as forming part of the transmission network of one of the **Contracting Parties** concerned, in order to avoid flows within control blocks being considered as cross-border flows under point (b) of the first subparagraph of this paragraph and giving rise to compensation payments under Article 13. The regulatory authorities of the **Contracting Parties** concerned may decide which of the **Contracting Parties** concerned shall be that of which the control block as a whole is to be considered to form part.

### **Article 3**

#### **Certification of transmission system operators**

1. The **Energy Community Secretariat** shall examine any notification of a decision on the certification of a transmission system operator as laid down in Article 10(6) of Directive 2009/72/EC as soon as it is received. Within **four months** of the day of receipt of such notification, the **Energy Community Secretariat** shall deliver its opinion to the relevant national regulatory authority as to its compatibility with Article 10(2) or Article 11, and Article 9 of Directive 2009/72/EC.

**When preparing the opinion referred to in the first subparagraph, the Secretariat shall request the Energy Community Regulatory Board to provide its opinion on the national regulatory authority's decision.**

In the absence of an opinion by the **Energy Community Secretariat** within the periods referred to in the first subparagraph, the **Energy Community Secretariat** shall be deemed not to raise objections to the regulatory authority's decision.

2. Within two months of receiving an opinion of the **Energy Community Secretariat**, the national regulatory authority shall adopt its final decision regarding the certification of the transmission system operator, taking the utmost account of that opinion. The regulatory authority's decision and the **Energy Community Secretariat's** opinion shall be published together.

3. At any time during the procedure, regulatory authorities and/or the **Energy Community Secretariat** may request from a transmission system operator and/or an undertaking performing any of the functions of generation or supply any information relevant to the fulfilment of their tasks under this Article.

4. Regulatory authorities and the **Energy Community Secretariat** shall preserve the confidentiality of commercially sensitive information.

5. <...>

6. Where the **Energy Community Secretariat** has received notification of the certification of a transmission system operator under Article 9(10) of Directive 2009/72/EC, the **Secretariat shall issue an opinion relating to certification. The regulatory authority shall take the utmost account of that opinion. Where the final decision diverges from the Secretariat's opinion, the regulatory authority concerned shall provide and publish, together with that decision, the reasoning underlying its decision. Diverging decisions shall be included in the agenda of the first meeting of the Ministerial Council following the date of the decision, for information and discussion.**

**Article 4**

**European network of transmission system operators for electricity**

<...>

**Article 5**

**Establishment of the ENTSO for Electricity**

<...>

**Article 6**

**Establishment of network codes<sup>1</sup>**

1. The Energy Community shall endeavour to apply the network codes developed at European Union level <...>.
2. The relevant network codes shall be adopted by the Permanent High Level Group, following the procedure laid down in Article 79 of the Treaty. Before taking a decision, the Permanent High Level Group shall seek the opinion of the Energy Community Regulatory Board.
3. The Permanent High Level Group shall adopt a procedural act on application of this Article.<sup>2</sup>

**Article 7**

**Amendments of network codes**

<...>

**Article 8**

**Tasks of the ENTSO for Electricity**

<...>

**Article 9**

**Monitoring by the Agency**

<...>

---

<sup>1</sup> The following text corresponds to Article 28 of Decision 2011/02/MC-EnC.

<sup>2</sup> Procedural Act 01/2012/PHLG-EnC of Permanent High Level Group of 21 June 2012 laying down the rules governing the adoption of Guidelines and Network Codes in the Energy Community was adopted on 21 June 2012.

**Article 10****Consultations**

&lt;...&gt;

**Article 11****Costs**

&lt;...&gt;

**Article 12<sup>3</sup>****Regional cooperation of transmission system operators**

**Transmission system operators shall promote operational arrangements in order to ensure the optimum management of the Energy Community network and shall promote the development of energy exchanges, the coordinated allocation of cross-border capacity through non-discriminatory market-based solutions, paying due attention to the specific merits of implicit auctions for short-term allocations, and the integration of balancing and reserve power mechanisms.**

**Article 13****Inter-transmission system operator compensation mechanism**

1. Transmission system operators shall receive compensation for costs incurred as a result of hosting cross-border flows of electricity on their networks.
2. The compensation referred to in paragraph 1 shall be paid by the operators of national transmission systems from which cross-border flows originate and the systems where those flows end.
3. Compensation payments shall be made on a regular basis with regard to a given period of time in the past. *Ex-post* adjustments of compensation paid shall be made where necessary, to reflect costs actually incurred.

&lt;...&gt;

**4. <...><sup>4</sup>**

5. The magnitude of cross-border flows hosted and the magnitude of cross-border flows designated as originating and/or ending in national transmission systems shall be determined on the basis of the physical flows of electricity actually measured during a given period of time.
6. The costs incurred as a result of hosting cross-border flows shall be established on the basis of the forward-looking long-run average incremental costs, taking into account losses, investment in

<sup>3</sup> In accordance with Article 7(3) of Decision 2011/02/MC-EnC, Article 25 of that Decision is displayed here.

<sup>4</sup> Not applicable in accordance with Article 12(1) of Decision 2011/02/MC-EnC. According to Article 12(2) of that Decision, "[t]he Energy Community shall endeavour to adopt as soon as possible Commission Regulation (EU) No 774/2010 of 2 September 2010 on laying down guidelines relating to inter-transmission system operator compensation and a common regulatory approach to transmission charging."

new infrastructure, and an appropriate proportion of the cost of existing infrastructure, in so far as such infrastructure is used for the transmission of cross-border flows, in particular taking into account the need to guarantee security of supply. When establishing the costs incurred, recognized standard-costing methodologies shall be used. Benefits that a network incurs as a result of hosting cross-border flows shall be taken into account to reduce the compensation received.

#### **Article 14**

##### **Charges for access to networks**

1. Charges applied by network operators for access to networks shall be transparent, take into account the need for network security and reflect actual costs incurred insofar as they correspond to those of an efficient and structurally comparable network operator and are applied in a non-discriminatory manner. Those charges shall not be distance-related.
2. Where appropriate, the level of the tariffs applied to producers and/or consumers shall provide locational signals at **Energy Community** level, and take into account the amount of network losses and congestion caused, and investment costs for infrastructure.
3. When setting the charges for network access, the following shall be taken into account:
  - (a) payments and receipts resulting from the inter-transmission system operator compensation mechanism;
  - (b) actual payments made and received as well as payments expected for future periods of time, estimated on the basis of past periods.
4. Setting the charges for network access under this Article shall be without prejudice to charges on declared exports and declared imports resulting from congestion management referred to in Article 16.
5. There shall be no specific network charge on individual transactions for declared transits of electricity.

#### **Article 15**

##### **Provision of information**

1. Transmission system operators shall put in place coordination and information exchange mechanisms to ensure the security of the networks in the context of congestion management.
2. The safety, operational and planning standards used by transmission system operators shall be made public. The information published shall include a general scheme for the calculation of the total transfer capacity and the transmission reliability margin based upon the electrical and physical features of the network. Such schemes shall be subject to the approval of the regulatory authorities.
3. Transmission system operators shall publish estimates of available transfer capacity for each day, indicating any available transfer capacity already reserved. Those publications shall be made at specified intervals before the day of transport and shall include, in any event, week-ahead and month-ahead estimates, as well as a quantitative indication of the expected reliability of the available capacity.

4. Transmission system operators shall publish relevant data on aggregated forecast and actual demand, on availability and actual use of generation and load assets, on availability and use of the networks and interconnections, and on balancing power and reserve capacity. For availability and actual use of small generation and load units, aggregated estimate data may be used.
5. The market participants concerned shall provide the transmission system operators with the relevant data.
6. Generation undertakings which own or operate generation assets, where at least one generation asset has an installed capacity of at least 250 MW, shall keep at the disposal of the national regulatory authority, the national competition authority and the **Energy Community Secretariat**, for five years all hourly data per plant that is necessary to verify all operational dispatching decisions and the bidding behaviour at power exchanges, interconnection auctions, reserve markets and over-the-counter-markets. The per-plant and per hour information to be stored shall include, but shall not be limited to, data on available generation capacity and committed reserves, including allocation of those committed reserves on a per-plant level, at the times the bidding is carried out and when production takes place.

### **Article 16**

#### **General principles of congestion management**

1. Network congestion problems shall be addressed with non-discriminatory market-based solutions which give efficient economic signals to the market participants and transmission system operators involved. Network congestion problems shall preferentially be solved with non-transaction based methods, i.e. methods that do not involve a selection between the contracts of individual market participants.
2. Transaction curtailment procedures shall only be used in emergency situations where the transmission system operator must act in an expeditious manner and re-dispatching or countertrading is not possible. Any such procedure shall be applied in a non-discriminatory manner.  
Except in cases of force majeure, market participants who have been allocated capacity shall be compensated for any curtailment.
3. The maximum capacity of the interconnections and/or the transmission networks affecting cross-border flows shall be made available to market participants, complying with safety standards of secure network operation.
4. Market participants shall inform the transmission system operators concerned a reasonable time in advance of the relevant operational period whether they intend to use allocated capacity. Any allocated capacity that will not be used shall be reattributed to the market, in an open, transparent and non-discriminatory manner.
5. Transmission system operators shall, as far as technically possible, net the capacity requirements of any power flows in opposite direction over the congested interconnection line in order to use that line to its maximum capacity. Having full regard to network security, transactions that relieve the congestion shall never be denied.
6. Any revenues resulting from the allocation of interconnection shall be used for the following purposes:

- (a) guaranteeing the actual availability of the allocated capacity; and/or
- (b) maintaining or increasing interconnection capacities through network investments, in particular in new interconnectors.

If the revenues cannot be efficiently used for the purposes set out in points (a) and/or (b) of the first subparagraph, they may be used, subject to approval by the regulatory authorities of the **Contracting Parties** concerned, up to a maximum amount to be decided by those regulatory authorities, as income to be taken into account by the regulatory authorities when approving the methodology for calculating network tariffs and/or fixing network tariffs.

The rest of revenues shall be placed on a separate internal account line until such time as it can be spent on the purposes set out in points (a) and/or (b) of the first subparagraph. The regulatory authority shall inform the **Energy Community Secretariat** of the approval referred to in the second subparagraph.

### **Article 17**

#### **New interconnectors**

1. New direct current interconnectors may, upon request, be exempted, for a limited period of time, from the provisions of Article 16(6) of this Regulation and Articles 9, 32 and Article 37(6) and (10) of Directive 2009/72/EC under the following conditions:

- (a) the investment must enhance competition in electricity supply;
- (b) the level of risk attached to the investment is such that the investment would not take place unless an exemption is granted;
- (c) the interconnector must be owned by a natural or legal person which is separate at least in terms of its legal form from the system operators in whose systems that interconnector will be built;
- (d) charges are levied on users of that interconnector;
- (e) since **1 July 2007**, no part of the capital or operating costs of the interconnector has been recovered from any component of charges made for the use of transmission or distribution systems linked by the interconnector; and
- (f) the exemption must not be to the detriment of competition or the effective functioning of the internal market in electricity, or the efficient functioning of the regulated system to which the interconnector is linked.

2. Paragraph 1 shall also apply, in exceptional cases, to alternating current interconnectors provided that the costs and risks of the investment in question are particularly high when compared with the costs and risks normally incurred when connecting two neighbouring national transmission systems by an alternating current interconnector.

3. Paragraph 1 shall also apply to significant increases of capacity in existing interconnectors.

4. The decision on the exemption under paragraphs 1, 2 and 3 shall be taken on a case-by-case basis by the regulatory authorities of the **Contracting Parties** concerned. An exemption may cover all or part of the capacity of the new interconnector, or of the existing interconnector with significantly increased capacity.

Within two months from the date on which the request for exemption was received by the last of

the regulatory authorities concerned, the **Energy Community Regulatory Board** may submit an advisory opinion to those regulatory authorities which could provide a basis for their decision.

In deciding to grant an exemption, consideration shall be given, on a case-by-case basis, to the need to impose conditions regarding the duration of the exemption and non-discriminatory access to the interconnector. When deciding those conditions, account shall, in particular, be taken of additional capacity to be built or the modification of existing capacity, the time-frame of the project and national circumstances.

Before granting an exemption, the regulatory authorities of the **Contracting Parties** concerned shall decide upon the rules and mechanisms for management and allocation of capacity.

Congestion-management rules shall include the obligation to offer unused capacity on the market and users of the facility shall be entitled to trade their contracted capacities on the secondary market. In the assessment of the criteria referred to in points (a), (b) and (f) of paragraph 1, the results of the capacity-allocation procedure shall be taken into account.

Where all the regulatory authorities concerned have reached agreement on the exemption decision within six months, they shall inform the **Energy Community Regulatory Board** of that decision.

The exemption decision, including any conditions referred to in the second subparagraph of this paragraph, shall be duly reasoned and published.

5. The decision referred to in paragraph 4 shall be taken by the **Energy Community Regulatory Board**:

(a) where all the regulatory authorities concerned have not been able to reach an agreement within six months from the date the exemption was requested before the last of those regulatory authorities; or

(b) upon a joint request from the regulatory authorities concerned.

Before taking such a decision, the **Energy Community Regulatory Board** shall consult the regulatory authorities concerned and the applicants.

6. Notwithstanding paragraphs 4 and 5, **Contracting Parties** may provide for the regulatory authority or the **Energy Community Regulatory Board**, as the case may be, to submit, for formal decision, to the relevant body in the **Contracting Party**, its opinion on the request for an exemption. That opinion shall be published together with the decision.

7. A copy of every request for exemption shall be transmitted for information without delay by the regulatory authorities to the **Energy Community Regulatory Board** and to the **Energy Community Secretariat** on receipt. The decision shall be notified, without delay, by the regulatory authorities concerned or by the **Energy Community Regulatory Board** (notifying bodies), to the **Energy Community Secretariat**, together with all the relevant information with respect to the decision. That information may be submitted to the **Energy Community Secretariat** in aggregate form, enabling the **Energy Community Secretariat** to reach a well-founded decision. In particular, the information shall contain:

(a) the detailed reasons on the basis of which the exemption was granted or refused, including the financial information justifying the need for the exemption;

(b) the analysis undertaken of the effect on competition and the effective functioning of the internal market in electricity resulting from the grant of the exemption;

(c) the reasons for the time period and the share of the total capacity of the interconnector in ques-

tion for which the exemption is granted; and

(d) the result of the consultation of the regulatory authorities concerned.

8. Within a period of two months from the day following receipt of notification under paragraph 7, the **Secretariat may issue an opinion inviting** the notifying bodies to amend or withdraw the decision to grant an exemption. That two-month period may be extended by an additional period of two months where further information is sought by the **Energy Community Secretariat**. That additional period shall begin on the day following receipt of the complete information. The initial two-month period may also be extended by consent of both the **Energy Community Secretariat** and the notifying bodies.

When the requested information is not provided within the period set out in the request, the notification shall be deemed to be withdrawn unless, before the expiry of that period, either the period is extended by consent of both the Secretariat and the notifying bodies, or the notifying bodies, in a duly reasoned statement, inform the Secretariat that they consider the notification to be complete.

**The notifying bodies shall take the utmost account of a Secretariat opinion that recommends to amend or withdraw the exemption decision. Where the final decision diverges from the Secretariat's opinion, the regulatory authority concerned shall provide and publish, together with that decision, the reasoning underlying its decision. Diverting decisions shall be included in the agenda of the first meeting of the Ministerial Council following the date of the decision, for information and discussion.**

The **Secretariat** shall preserve the confidentiality of commercially sensitive information.

The **Secretariat's opinion** on an exemption decision shall expire two years after the date of its adoption in the event that construction of the interconnector has not yet started by that date, and five years after the date of its adoption if the interconnector has not become operational by that date, unless the **Secretariat** considers that any delay is due to major obstacles beyond the control of the person to whom the exemption has been granted.

9. <...>

### **Article 18** **Guidelines<sup>5</sup>**

**The Energy Community shall endeavour to apply the Guidelines adopted by the European Commission under <...> Regulation (EC) No 714/2009 <...>.**

**These Guidelines, which may need to be adapted to the institutional framework of the Energy Community, shall be adopted by the Permanent High Level Group, following the procedure laid down in Article 79 of the Treaty.**

**The Permanent High Level Group shall adopt a Procedural Act on the application of this article.<sup>6</sup>**

<sup>5</sup> The text displayed here corresponds to Article 27 of Decision 2011/02/MC-EnC.

<sup>6</sup> Procedural Act 01/2012/PHLG-EnC of Permanent High Level Group of 21 June 2012 laying down the rules governing the adoption of Guidelines and Network Codes in the Energy Community was adopted on 21 June 2012.

## **Article 19**

### **Regulatory authorities**

The regulatory authorities, when carrying out their responsibilities, shall ensure compliance with this Regulation and the Guidelines adopted pursuant to Article 18.<sup>7</sup>

Where appropriate to fulfil the aims of this Regulation the regulatory authorities shall cooperate with each other, with the **Energy Community Secretariat** and the **Energy Community Regulatory Board** in compliance with Chapter IX of Directive 2009/72/EC.

## **Article 20**

### **Provision of information and confidentiality**

1. **Contracting Parties** and the regulatory authorities shall, on request, provide to the **Energy Community Secretariat** all information necessary for the purposes of <...> Article 18.<sup>8</sup>

In particular, for the purposes of Article 13 <...> (6), regulatory authorities shall, on a regular basis, provide information on the actual costs incurred by national transmission system operators, as well as data and all relevant information relating to the physical flows in transmission system operators' networks and the cost of the networks.

The **Energy Community Secretariat** shall fix a reasonable time limit within which the information is to be provided, taking into account the complexity of the information required and the urgency with which the information is needed.

2. If the **Contracting Party** or the regulatory authority concerned does not provide the information referred to in paragraph 1 within the given time-limit pursuant to paragraph 1 of this Article, the **Energy Community Secretariat** may request all information necessary for the purpose of <...> Article 18 directly from the undertakings concerned.

When sending a request for information to an undertaking, the **Energy Community Secretariat** shall at the same time forward a copy of the request to the regulatory authorities of the **Contracting Party** in whose territory the seat of the undertaking is situated.

3. In its request for information under paragraph 1, the **Energy Community Secretariat** shall state the legal basis of the request, the time-limit within which the information is to be provided, the purpose of the request <...> .<sup>9</sup> The **Energy Community Secretariat** shall fix a reasonable time-limit taking into account the complexity of the information required and the urgency with which the information is needed.

4. The owners of the undertakings or their representatives and, in the case of legal persons, the persons authorised to represent them by law or by their instrument of incorporation, shall supply the information requested. Where lawyers duly authorised so to act supply the information on behalf of their clients, the client shall remain fully responsible in the event that the information supplied is incomplete, incorrect or misleading.

<sup>7</sup> As adopted by the Permanent High Level Group under Procedural Act 01/2012/PHLG-EnC.

<sup>8</sup> As adopted by the Permanent High Level Group under Procedural Act 01/2012/PHLG-EnC.

<sup>9</sup> According to Article 19(2) of Decision 2011/02/MC-EnC, Article 22(2) of Regulation (EC) 714/2009 shall not be applicable.

5. <...>

6. The information referred to in paragraphs 1 and 2 shall be used only for the purposes of <...> Article 18.

The **Energy Community Secretariat** shall not disclose information acquired pursuant to this Regulation of the kind covered by the obligation of professional secrecy.

### **Article 21**

#### **Right of Contracting Parties to provide for more detailed measures**

This Regulation shall be without prejudice to the rights of **Contracting Parties** to maintain or introduce measures that contain more detailed provisions than those set out herein or in the Guidelines referred to in Article 18.<sup>10</sup>

### **Article 22**

#### **Penalties<sup>11</sup>**

**1. Contracting Parties shall lay down rules on penalties applicable to infringements of the provisions of this Regulation and shall take all measures necessary to ensure that those provisions are implemented. The penalties provided for must be effective, proportionate and dissuasive. Contracting Parties shall notify these provisions to the Secretariat by 1 January 2015 and shall notify the Secretariat without delay of any subsequent amendment affecting them.**

2. <...>

3. Penalties provided for pursuant to paragraph 1 shall not be of a criminal law nature.

### **Article 23**

#### **Committee procedure**

<...>

### **Article 24**

#### **Secretariat report<sup>12</sup>**

**1. The Secretariat shall monitor and review the application of this Decision in the Contracting Parties.**

**2. The Secretariat shall submit an overall progress report to the Ministerial Council for the first time by 30 June 2012, and thereafter on an annual basis. The progress report shall**

<sup>10</sup> As adopted by the Permanent High Level Group under Procedural Act 01/2012/PHLG-EnC.

<sup>11</sup> As adapted by Article 19 of Decision 2011/02/MC-EnC.

<sup>12</sup> The text displayed here corresponds to Article 31 of Decision 2011/02/MC-EnC.

reflect the progress made on creating a complete and fully operational internal market in electricity and gas and the obstacles that remain in this respect, including aspects of market dominance, market concentration, predatory or anti-competitive behaviour and the effect thereof in terms of market distortion. It shall in particular consider:

- the implementation by each Contracting Party of the provisions on unbundling, certification and on independence of the national regulatory authorities and application of these provisions in practice,
- the existence of non-discriminatory network access,
- effective regulation,
- the development of interconnection infrastructure and the security of supply situation in the Energy Community,
- the extent to which the full benefits of the opening of markets are accruing to small enterprises and household customers, notably with respect to public service and universal service standards,
- the extent to which markets are in practice open to effective competition, including aspects of market dominance, market concentration and predatory or anti-competitive behaviour,
- the extent to which customers are actually switching suppliers and renegotiating tariffs,
- price developments, including supply prices, in relation to the degree of opening of the markets, and
- the experience gained from application of this Decision as far as effective independence of system operators in vertically integrated undertakings is concerned and whether other measures in addition to functional independence and separation of accounts have been developed which have effects equivalent to legal unbundling.

3. The Secretariat shall present a report to the Ministerial Council for the first time by 30 June 2012, and thereafter on an annual basis, summarising the opinions issued by the Secretariat in application of the acts referred to in Article 1, as adapted by this Decision.

#### **Article 25**

##### **Repeal**

<...>

**Article 26**

**Entry into force<sup>13</sup>**

**This Decision [2011/02/MC-EnC] enters into force upon its adoption and is addressed to the Contracting Parties.**

**Article 3 of Decision 2011/02/MC-EnC**

**Each Contracting Party shall bring into force the laws, regulations and administrative provisions necessary to comply with <...> Regulation (EC) 714/2009 <...>, as adapted by this Decision, by 1 January 2015.<sup>14</sup> They shall forthwith inform the Energy Community Secretariat thereof.**

<...>

**The Contracting Parties shall communicate to the Energy Community Secretariat the text of the main provisions of national law which they adopt in the field covered by this Decision.**

---

<sup>13</sup> The text displayed here corresponds to Article 32 of Decision 2011/02/MC-EnC.

<sup>14</sup> In accordance with the Accession Protocol, the corresponding date for Georgia is 31 December 2018.

## ANNEX I

### GUIDELINES ON THE MANAGEMENT AND ALLOCATION OF AVAILABLE TRANSFER CAPACITY OF INTERCONNECTIONS BETWEEN NATIONAL SYSTEMS

#### 1. General Provisions

1.1. Transmission system operators (TSOs) shall endeavour to accept all commercial transactions, including those involving cross-border-trade.

1.2. When there is no congestion, there shall be no restriction of access to the interconnection. Where this is usually the case, there need be no permanent general allocation procedure for access to a cross-border transmission service.

1.3. Where scheduled commercial transactions are not compatible with secure network operation, the TSOs shall alleviate congestion in compliance with the requirements of network operational security while endeavouring to ensure that any associated costs remain at an economically efficient level. Curative re-dispatching or countertrading shall be envisaged in case lower cost measures cannot be applied.

1.4. If structural congestion appears, appropriate congestion-management methods and arrangements defined and agreed upon in advance shall be implemented immediately by the TSOs. The congestion-management methods shall ensure that the physical power flows associated with all allocated transmission capacity comply with network security standards.

1.5. The methods adopted for congestion management shall give efficient economic signals to market participants and TSOs, promote competition and be suitable for regional and Community-wide application.

1.6. No transaction-based distinction shall be applied in congestion management. A particular request for transmission service shall be denied only when the following cumulative conditions are fulfilled:

- (a) the incremental physical power flows resulting from the acceptance of that request imply that secure operation of the power system may no longer be guaranteed, and
- (b) the monetary value of the request in the congestion-management procedure is lower than all other requests intended to be accepted for the same service and conditions.

1.7. When defining appropriate network areas in and between which congestion management is to apply, TSOs shall be guided by the principles of cost-effectiveness and minimisation of negative impacts on the internal market in electricity. Specifically, TSOs shall not limit interconnection capacity in order to solve congestion inside their own control area, save for the abovementioned reasons and reasons of operational security<sup>15</sup>. If such a situation occurs, this shall be described and transparently presented by the TSOs to all the system users. Such a situation shall be tolerated only until a long-term solution is found. The methodology and projects for achieving the long-term solution shall be described and transparently presented by the TSOs to all the system users.

1.8. When balancing the network inside the control area through operational measures in the network and through re-dispatching, the TSO shall take into account the effect of those measures on neighbouring control areas.

<sup>15</sup> Operational security means "keeping the transmission system within agreed security limits".

1.9. By **31 December 2009**<sup>16</sup>, mechanisms for the intra-day congestion management of interconnector capacity shall be established in a coordinated way and under secure operational conditions, in order to maximise opportunities for trade and to provide for cross-border balancing.

1.10. The national regulatory authorities shall regularly evaluate the congestion-management methods, paying particular attention to compliance with the principles and rules established in this Regulation and those Guidelines and with the terms and conditions set by the regulatory authorities themselves under those principles and rules. Such evaluation shall include consultation of all market participants and dedicated studies.

## 2. Congestion-management methods

2.1. Congestion-management methods shall be market-based in order to facilitate efficient cross-border trade. For that purpose, capacity shall be allocated only by means of explicit (capacity) or implicit (capacity and energy) auctions. Both methods may coexist on the same interconnection. For intra-day trade continuous trading may be used.

2.2. Depending on competition conditions, the congestion-management mechanisms may need to allow for both long and short-term transmission capacity allocation.

2.3. Each capacity-allocation procedure shall allocate a prescribed fraction of the available interconnection capacity plus any remaining capacity not previously allocated and any capacity released by capacity holders from previous allocations.

2.4. TSOs shall optimise the degree to which capacity is firm, taking into account the obligations and rights of the TSOs involved and the obligations and rights of market participants, in order to facilitate effective and efficient competition. A reasonable fraction of capacity may be offered to the market at a reduced degree of firmness, but the exact conditions for transport over cross-border lines shall, at all times, be made known to market participants.

2.5. The access rights for long and medium-term allocations shall be firm transmission capacity rights. They shall be subject to the use-it-or-lose-it or use-it-or-sell-it principles at the time of nomination.

2.6. TSOs shall define an appropriate structure for the allocation of capacity between different timeframes. This may include an option for reserving a minimum percentage of interconnection capacity for daily or intra-daily allocation. Such an allocation structure shall be subject to review by the respective regulatory authorities. In drawing up their proposals, the TSOs shall take into account:

- (a) the characteristics of the markets;
- (b) the operational conditions, such as the implications of netting firmly declared schedules;
- (c) the level of harmonisation of the percentages and timeframes adopted for the different capacity-allocation mechanisms in place.

2.7. Capacity allocation shall not discriminate between market participants that wish to use their rights to make use of bilateral supply contracts or to bid into power exchanges. The highest value bids, whether implicit or explicit in a given timeframe, shall be successful.

2.8. In regions where forward financial electricity markets are well developed and have shown their efficiency, all interconnection capacity may be allocated through implicit auctioning.

2.9. Other than in the case of new interconnectors which benefit from an exemption under Article

<sup>16</sup> Adapted by Article 2(2) of Decision 2008/02/MC-EnC.

7 of Regulation (EC) No 1228/2003 or Article 17 of this Regulation, establishing reserve prices in capacity-allocation methods shall not be allowed.

2.10. In principle, all potential market participants shall be permitted to participate in the allocation process without restriction. To avoid creating or aggravating problems related to the potential use of dominant position of any market player, the relevant regulatory and/or competition authorities, where appropriate, may impose restrictions in general or on an individual company on account of market dominance.

2.11. Market participants shall firmly nominate their use of the capacity to the TSOs by a defined deadline for each timeframe. That deadline shall be such that TSOs are able to reassign unused capacity for reallocation in the next relevant timeframe - including intra-day sessions.

2.12. Capacity shall be freely tradable on a secondary basis, provided that the TSO is informed sufficiently in advance. Where a TSO refuses any secondary trade (transaction), this must be clearly and transparently communicated and explained to all the market participants by that TSO and notified to the regulatory authority.

2.13. The financial consequences of failure to honour obligations associated with the allocation of capacity shall be attributed to those who are responsible for such a failure. Where market participants fail to use the capacity that they have committed to use, or, in the case of explicitly auctioned capacity, fail to trade on a secondary basis or give the capacity back in due time, they shall lose the rights to such capacity and pay a cost-reflective charge. Any cost-reflective charges for the non-use of capacity shall be justified and proportionate. Likewise, if a TSO does not fulfil its obligation, it shall be liable to compensate the market participant for the loss of capacity rights. No consequential losses shall be taken into account for that purpose. The key concepts and methods for the determination of liabilities that accrue upon failure to honour obligations shall be set out in advance in respect of the financial consequences, and shall be subject to review by the relevant national regulatory authority or authorities.

### 3. Coordination

3.1. Capacity allocation at an interconnection shall be coordinated and implemented using common allocation procedures by the TSOs involved. In cases where commercial exchanges between two countries (TSOs) are expected to affect physical flow conditions in any third-country (TSO) significantly, congestion-management methods shall be coordinated between all the TSOs so affected through a common congestion-management procedure. National regulatory authorities and TSOs shall ensure that no congestion-management procedure with significant effects on physical electric power flows in other networks is devised unilaterally.

3.2. A common coordinated congestion-management method and procedure for the allocation of capacity to the market at least annually, monthly and day-ahead shall be applied by 1 January 2007 between countries in the following regions:

- (a) Northern Europe (i.e. Denmark, Sweden, Finland, Germany and Poland),
- (b) North-West Europe (i.e. Benelux, Germany and France),
- (c) Italy (i.e. Italy, France, Germany, Austria, Slovenia and Greece),
- (d) Central Eastern Europe (i.e. Germany, Poland, Czech Republic, Slovakia, Hungary, Austria and Slovenia),

(e) South-West Europe (i.e. Spain, Portugal and France),

(f) UK, Ireland and France,

(g) Baltic states (i.e. Estonia, Latvia and Lithuania).

At an interconnection involving countries belonging to more than one region, the congestion-management method applied may differ in order to ensure the compatibility with the methods applied in the other regions to which those countries belong. In that case, the relevant TSOs shall propose the method which shall be subject to review by the relevant regulatory authorities.

3.3. The regions referred to in point 2.8. may allocate all interconnection capacity through day-ahead allocation.

3.4. Compatible congestion-management procedures shall be defined in all those seven regions with a view to forming a truly integrated internal market in electricity. Market participants shall not be confronted with incompatible regional systems.

3.5. With a view to promoting fair and efficient competition and cross-border trade, coordination between TSOs within the regions set out in point 3.2. shall include all the steps from capacity calculation and optimisation of allocation to secure operation of the network, with clear assignments of responsibility. Such coordination shall include, in particular:

(a) the use of a common transmission model dealing efficiently with interdependent physical loop-flows and having regard to discrepancies between physical and commercial flows,

(b) allocation and nomination of capacity to deal efficiently with interdependent physical loop-flows,

(c) identical obligations on capacity holders to provide information on their intended use of the capacity, i.e. nomination of capacity (for explicit auctions),

(d) identical timeframes and closing times,

(e) identical structure for the allocation of capacity among different timeframes (for example, 1 day, 3 hours, 1 week, etc.) and in terms of blocks of capacity sold (amount of power in MW, MWh, etc.),

(f) consistent contractual framework with market participants,

(g) verification of flows to comply with the network security requirements for operational planning and for real-time operation,

(h) accounting and settlement of congestion-management actions.

3.6. Coordination shall also include the exchange of information between TSOs. The nature, time and frequency of information exchange shall be compatible with the activities set out in point 3.5 and the functioning of the electricity markets. That information exchange shall, in particular, enable the TSOs to make the best possible forecast of the global network situation in order to assess the flows in their network and the available interconnection capacities. Any TSO collecting information on behalf of other TSOs shall give back to the participating TSO the results of the collection of data.

#### 4. Timetable for market operations

- 4.1. The allocation of the available transmission capacity shall take place sufficiently in advance. Prior to each allocation, the involved TSOs shall, jointly, publish the capacity to be allocated, taking into account where appropriate the capacity released from any firm transmission rights and, where relevant, associated netted nominations, along with any time periods during which the capacity will be reduced or not available (for the purpose of maintenance, for example).
- 4.2. Having full regard to network security, the nomination of transmission rights shall take place sufficiently in advance, before the day-ahead sessions of all the relevant organised markets and before the publication of the capacity to be allocated under the day-ahead or intra-day allocation mechanism. Nominations of transmission rights in the opposite direction shall be netted in order to make efficient use of the interconnection.
- 4.3. Successive intra-day allocations of available transmission capacity for day D shall take place on days D-1 and D, after the issuing of the indicated or actual day-ahead production schedules.
- 4.4. When preparing day-ahead network operation, the TSOs shall exchange information with neighbouring TSOs, including their forecast network topology, the availability and forecasted production of generation units, and load flows in order to optimise the use of the overall network through operational measures in compliance with the rules for secure network operation.

#### 5. Transparency

- 5.1. TSOs shall publish all relevant data related to network availability, network access and network use, including a report on where and why congestion exists, the methods applied for managing the congestion and the plans for its future management.
- 5.2. TSOs shall publish a general description of the congestion-management method applied under different circumstances for maximising the capacity available to the market, and a general scheme for the calculation of the interconnection capacity for the different timeframes, based upon the electrical and physical realities of the network. Such a scheme shall be subject to review by the regulatory authorities of the **Contracting Parties** concerned.
- 5.3. The congestion management and capacity-allocation procedures in use, together with the times and procedures for applying for capacity, a description of the products offered and the obligations and rights of both the TSOs and the party obtaining the capacity, including the liabilities that accrue upon failure to honour obligations, shall be described in detail and made available in a transparent manner to all potential network users by TSOs.
- 5.4. The operational and planning security standards shall form an integral part of the information that TSOs publish in an open and public document. That document shall also be subject to review of the national regulatory authorities.
- 5.5. TSOs shall publish all relevant data concerning cross-border trade on the basis of the best possible forecast. In order to fulfil that obligation the market participants concerned shall provide the TSOs with the relevant data. The manner in which such information is published shall be subject to review by the regulatory authorities. TSOs shall publish at least:
- (a) annually: information on the long-term evolution of the transmission infrastructure and its impact on cross-border transmission capacity;

- (b) monthly: month- and year-ahead forecasts of the transmission capacity available to the market, taking into account all relevant information available to the TSO at the time of the forecast calculation (for example, impact of summer and winter seasons on the capacity of lines, maintenance of the network, availability of production units, etc.);
- (c) weekly: week-ahead forecasts of the transmission capacity available to the market, taking into account all relevant information available to the TSOs at the time of calculation of the forecast, such as the weather forecast, planned network maintenance work, availability of production units, etc.;
- (d) daily: day-ahead and intra-day transmission capacity available to the market for each market time unit, taking into account all netted day-ahead nominations, day-ahead production schedules, demand forecasts and planned network maintenance work;
- (e) total capacity already allocated, by market time unit, and all relevant conditions under which that capacity may be used (for example, auction clearing price, obligations on how to use the capacity, etc.), so as to identify any remaining capacity;
- (f) allocated capacity as soon as possible after each allocation, as well as an indication of prices paid;
- (g) total capacity used, by market time unit, immediately after nomination;
- (h) as closely as possible to real time: aggregated realised commercial and physical flows, by market time unit, including a description of the effects of any corrective actions taken by the TSOs (such as curtailment) for solving network or system problems;
- (i) *ex-ante* information on planned outages and *ex-post* information for the previous day on planned and unplanned outages of generation units larger than 100 MW.

5.6. All relevant information shall be available for the market in due time for the negotiation of all transactions (such as the time of negotiation of annual supply contracts for industrial customers or the time when bids have to be sent into organised markets).

5.7. The TSO shall publish the relevant information on forecast demand and on generation according to the timeframes referred to in points 5.5 and 5.6. The TSO shall also publish the relevant information necessary for the cross-border balancing market.

5.8. When forecasts are published, the *ex-post* realised values for the forecast information shall also be published in the time period following that to which the forecast applies or at the latest on the following day (D + 1).

5.9. All information published by the TSOs shall be made freely available in an easily accessible form. All data shall also be accessible through adequate and standardised means of information exchange, to be defined in close cooperation with market participants. The data shall include information on past time periods with a minimum of two years, so that new market entrants may also have access to such data.

5.10.<sup>17</sup> TSOs shall exchange regularly a set of sufficiently accurate network and load flow data in order to enable load flow calculations for each TSO in their relevant area. The same set of data shall be made available to the regulatory authorities and to the **Energy Community Secretariat** upon request. The regulatory authorities and the **Energy Community Secretariat** shall ensure the confidential treatment of that set of data, by themselves and by any consultant carrying out analytical work for them on the basis of those data.

<sup>17</sup> Adapted by Article 4(1)(d) of Decision 2011/02/MC-EnC.

## 6. Use of congestion income

6.1. Congestion-management procedures associated with a pre-specified timeframe may generate revenue only in the event of congestion which arises for that timeframe, except in the case of new interconnectors which benefit from an exemption under Article 7 of Regulation (EC) No 1228/2003 or Article 17 of this Regulation. The procedure for the distribution of those revenues shall be subject to review by the regulatory authorities and shall neither distort the allocation process in favour of any party requesting capacity or energy nor provide a disincentive to reduce congestion.

6.2. National regulatory authorities shall be transparent regarding the use of revenues resulting from the allocation of interconnection capacity.

6.3. The congestion income shall be shared among the TSOs involved in accordance with criteria agreed between the TSOs involved and reviewed by the respective regulatory authorities.

6.4. TSOs shall clearly establish beforehand the use they will make of any congestion income they may obtain and report on the actual use of that income. Regulatory authorities shall verify that such use complies with this Regulation and those Guidelines,<sup>18</sup> and that the total amount of congestion income resulting from the allocation of interconnection capacity is devoted to one or more of the three purposes set out in Article 16(6) of this Regulation.

6.5. On an annual basis, and by 31 July each year, the regulatory authorities shall publish a report setting out the amount of revenue collected for the 12-month period up to 30 June of the same year and the use made of the revenues in question, together with verification that that use complies with this Regulation and those Guidelines,<sup>19</sup> and that the total amount of congestion income is devoted to one or more of the three prescribed purposes.

6.6. The use of congestion income for investment to maintain or increase interconnection capacity shall preferably be assigned to specific predefined projects which contribute to relieving the existing associated congestion and which may also be implemented within a reasonable time, particularly as regards the authorisation process.

---

<sup>18</sup> As adopted by the Permanent High Level Group under Procedural Act 01/2012/PHLG-EnC.

<sup>19</sup> *ibid.*

## **REGULATION (EU) 838/2010 of 23 September 2010 on laying down guidelines relating to the inter-transmission system operator compensation mechanism and a common regulatory approach to transmission charging.**

Incorporated and adapted by Permanent High Level Group Decision 2013/01/PHLG-EnC of 23 October 2013 on the incorporation of the Commission Regulation (EU) 838/2010 in the Energy Community.

*The adaptations made by Permanent High Level Group Decision 2013/01/PHLG-EnC are highlighted in **bold and blue**.*

Whereas:

(1) Commission Regulation (EU) No 774/2010 of 2 September 2010 on laying down guidelines relating to inter-transmission system operator compensation and a common regulatory approach to transmission charging establishes a mechanism for the compensation of transmission system operators for the costs of hosting cross-border flows of electricity and a common regulatory approach to transmission charging. However, that Regulation will expire on 2 March 2011.

(2) In order to ensure the continuity of implementation the inter-transmission system operator compensation mechanism, new guidelines specified in Article 18(1) and (2) of Regulation (EC) No 714/2009 of 13 July 2009 should be adopted which reflect the institutional framework established by that Regulation. In particular, the Agency for the Co-operation of Energy Regulators (hereinafter 'the Agency'), established by Regulation (EC) No 713/2009 of the European Parliament and of the Council should be responsible for monitoring the implementation of the inter-transmission system operator compensation mechanism.

(3) Binding guidelines establishing an inter-transmission system operator compensation mechanism should establish a stable basis for the operation of the inter-transmission system operator compensation mechanism and fair compensation to transmission system operators for the costs of hosting cross-border flows of electricity.

(4) Transmission system operators from third countries or from territories which have concluded agreements with the Union whereby they have adopted and are applying Union law in the field of electricity should be entitled to participate in the inter-transmission system compensation Mechanism on an equivalent basis to transmission system operators from Member States.

(5) It is appropriate to allow transmission system operators in third countries which have not concluded agreements with the Union whereby they have adopted and are applying Union law in the field of electricity to enter into multi-party agreements with the transmission system operators in the Member States which enable all parties to be compensated for the costs of hosting cross-border flows of electricity on a fair and equitable basis.

(6) Transmission system operators should be compensated for energy losses resulting from hosting cross-border flows of electricity. Such compensation should be based on an estimate of what losses would have been incurred in the absence of transits of electricity.

(7) A fund should be established to compensate transmission system operators for the costs of making infrastructure available to host cross-border flows of electricity. The value of this fund should be based on a Union-wide assessment of the long run average incremental costs of making infrastruc-

ture available to host cross-border flows of electricity.

(8) The Union-wide assessment of electricity transmission infrastructure associated with facilitating cross-border flows of electricity should be carried out by the Agency as the body responsible for coordinating the activities of regulatory authorities who must carry out a similar function at a national level.

(9) Transmission system operators in third countries should face the same costs for using the Union transmission system as transmission system operators in Member States.

(10) Variations in charges faced by producers of electricity for access to the transmission system should not undermine the internal market. For this reason average charges for access to the network in Member States should be kept within a range which helps to ensure that the benefits of harmonisation are realised.

(11) The measures provided for in this Regulation are in accordance with the opinion of the Committee set up by Article 46 of Directive 2009/72/EC of the European Parliament and of the Council.

### **Article 1**

Transmission system operators shall receive compensation for costs incurred as a result of hosting cross-border flows of electricity on their networks on the basis of the guidelines set out in Part A of the Annex.

### **Article 2**

Charges applied by network operators for access to the transmission system shall be in accordance with guidelines set out in Part B of the Annex.

### **Article 3**

**This Decision [2013/01/PHLG-EnC] enters into force upon its adoption and is addressed to the Contracting Parties.<sup>1</sup>**

**Each Contracting Party shall transpose and implement Commission Regulation (EU) No 838/2010 of 23 September 2010 on laying down guidelines relating to the inter-transmission system operator comprehension mechanism and a common regulatory approach to transmission charging by 1 January 2014.<sup>2</sup>**

<sup>1</sup> The text displayed here corresponds to Article 4 of Decision 2013/01/PHLG-EnC.

<sup>2</sup> The text displayed here corresponds to Article 1(1) of Decision 2013/01/PHLG-EnC.

**The transposition shall be made without changes to the structure and text of Commission Regulation (EU) No 838/2010 other than translation.<sup>3</sup>**

**Commission Regulation (EU) No 838/2010 shall be made binding on market participants.**

**The national regulatory authorities shall be tasked with monitoring and enforcing compliance with Commission Regulation (EU) No 838/2010.<sup>4</sup>**

**Contracting Parties shall notify the Secretariat of the measures transposing this Decision, and of any subsequent changes made to those measures, within two weeks of the adoption of such measures.<sup>5</sup>**

---

<sup>3</sup> The text displayed here corresponds to Article Article 1(2) of Decision 2013/01/PHLG-EnC.

<sup>4</sup> The text displayed here corresponds to Article 2 of Decision 2013/01/PHLG-EnC.

<sup>5</sup> The text displayed here corresponds to Article 3 of Decision 2013/01/PHLG-EnC.

## ANNEX

### PART A

#### **Guidelines on the Inter-Transmission System Operator Compensation Mechanism**

##### **1. General Provisions**

1.1. The Inter-Transmission System Operator Compensation (ITC) mechanism shall provide for compensation for the costs of hosting cross-border flows of electricity including providing cross-border access to the interconnected system.

1.2. The European Network of Transmission System Operators for Electricity (ENTSO for Electricity) set up in accordance with Article 5 of Regulation (EC) 714/2009 shall establish an ITC fund for the purpose of compensating transmission system operators for the costs of hosting cross-border flows of electricity.

The ITC fund shall provide compensation for:

(1) the costs of losses incurred national transmission systems as a result of hosting cross-border flows of electricity; and,

(2) the costs of making infrastructure available to host cross-border flows of electricity.

1.3. Contributions to the ITC Fund shall be calculated in accordance with points 6 and 7.

Payments from the ITC Fund shall be calculated in accordance with points 4 and 5.

ENTSO for Electricity shall be responsible for establishing arrangements for the collection and disbursement of all payments relating to the ITC Fund, and shall also be responsible for determining the timing of payments. All contributions and payments shall be made as soon as possible, and at the latest within six months of the end of the period to which they apply.

1.4. The Agency shall oversee the implementation of the ITC mechanism and report to the Commission each year on the implementation of the ITC mechanism and the management of the ITC fund.

ENTSO for Electricity shall co-operate with the Commission and with the Agency in this task and shall provide the Agency with all information necessary for this purpose.

Each transmission system operator shall provide ENTSO for Electricity and the Agency with all information necessary for the implementation of the ITC Mechanism.

1.5. Until such time as ENTSO for Electricity has been established, transmission system operators shall co-operate amongst themselves to carry out the tasks assigned to ENTSO for Electricity in relation to the ITC mechanism.

1.6. Transit of electricity shall be calculated, normally on an hourly basis, by taking the lower of the absolute amount of imports of electricity and the absolute amount of exports of electricity on interconnections between national transmission systems.

For the purpose of calculating transits of electricity the amount of imports and the amount of exports at each interconnection between national transmission systems shall be reduced in proportion to the share of capacity allocated in a manner which is not compatible with Point 2 of the guidelines on

congestion management set out in Annex I of Regulation (EC) No 714/2009.

Notwithstanding the provisions of the second subparagraph of this point imports and exports of electricity on interconnections with third countries to which the provisions of point 7.1 apply shall be included in the calculation of transit of electricity.

1.7. For the purposes of this part of the Annex, the net flow of electricity shall mean the absolute value of the difference between total exports of electricity from a given national transmission system to countries where the TSOs participate in the ITC Mechanism and total imports of electricity from countries where the TSOs participate in the ITC Mechanism to the same transmission system.

For ITC mechanism parties with a common border with at least one third country to which the provisions of Point 7.1 apply the following adjustments to the calculation of net flow shall be made:

(1) if total exports of electricity to countries where the TSOs participate in the ITC Mechanism are greater than total imports of electricity from countries where the TSOs participate in the ITC Mechanism, net flows shall be reduced by the lower of:

(a) net import flows from those third countries; or

(b) net export flows to countries where the transmission system operator participates in the ITC Mechanism.

(2) if total imports of electricity from countries where the TSOs participate in the ITC Mechanism are greater than total exports of electricity to countries where the TSOs participate in the ITC Mechanism then net flows shall be reduced by the lower of

(a) net export flows to those third countries; or

(b) net import flows from countries where the transmission system operator participates in the ITC mechanism.

1.8. For the purposes of this annex load shall mean the total amount of electricity which exits the national transmission system to connected distribution systems, end consumers connected to the transmission system and to electricity producers for consumption in the generation of electricity.

## **2. Participation in the ITC mechanism**

2.1. Each regulatory authority shall ensure that transmission system operators in its area of competence participate in the ITC mechanism and that no additional charges for hosting cross-border flows of electricity are included in charges applied by transmission system operators for access to networks.

2.2. Transmission system operators from third countries which have concluded agreements with the Union whereby they have adopted and are applying Union law in the field of electricity shall be entitled to participate in the ITC mechanism.

In particular, the transmission system operators operating in the territories referred to in Article 9 of the Energy Community Treaty shall be entitled to participate in the ITC mechanism.

Each transmission system operator from a third country participating in the ITC mechanism shall be treated on an equivalent basis to a transmission system operator of a Member State.

### 3. Multi-Party Agreements

3.1. ENTSO for Electricity shall facilitate the conclusion of multi-party agreements relating to the compensation for the costs of hosting cross-border flows of electricity between transmission system operators participating in the ITC mechanism and those transmission system operators from third countries which have not concluded agreements with the Union whereby they have adopted and are applying Union law in the field of electricity, and which, on 16 December 2009, signed the voluntary agreement between transmission system operators on inter-transmission system operator compensation.

3.2. Such multi-party agreements shall aim at ensuring that the transmission system operator from the third country be treated on an equivalent basis to a transmission system operator in a country participating in the ITC Mechanism.

3.3. Where necessary such multi-party agreements may recommend appropriate adjustment to total compensation for the compensation for making infrastructure available to host cross-border flows of electricity determined in accordance with point 5. Any such adjustment shall be subject to approval by the Commission, taking account of the opinion of the Agency.

3.4. The treatment of the transmission system operator from the third country shall not be more favourable in comparison to that which would apply to a transmission system operator participating in the ITC Mechanism.

3.5. ENTSO for Electricity shall submit all such multi-party agreements to the Commission for its opinion as to whether continuation of the multi-party agreement promotes the completion and functioning of the internal market in electricity and cross-border trade. The opinion of the Commission shall address in particular:

(1) whether the agreement relates only to compensation between transmission system operators (TSOs) for the costs of hosting cross-border flows of electricity;

(2) whether the requirements of points 3.2 and 3.4 are respected.

3.6. In preparing the opinion referred to in point 3.5 the Commission shall consult all the Member States, taking particular account of the views of those Member States sharing a border with the relevant third country.

In preparing its opinion the Commission may consult the Agency.

### 4. Compensation for Losses

4.1. Compensation for losses incurred on national transmission systems as a result of hosting cross-border flows of electricity shall be calculated separately from compensation for costs incurred associated with making infrastructure available to host cross-border flows of electricity.

4.2. The amount of losses incurred on a national transmission system shall be established by calculating the difference between:

(1) the amount of losses actually incurred on the transmission system during the relevant period; and,

(2) the estimated amount of losses on the transmission system which would have been incurred on the system during the relevant period if no transits of electricity had occurred.

4.3. ENTSO for Electricity shall be responsible for carrying out the calculation referred to in point 4.2 and shall publish this calculation and its method in an appropriate format. This calculation may be derived from estimates for a number of points of time during the relevant period.

4.4. The value of losses incurred by a national transmission system as a result of the cross-border flow of electricity shall be calculated on the same basis as that approved by the regulatory authority in respect of all losses on the national transmission systems. The Agency shall verify the criteria for the valuation of losses at national level taking particular account that losses are valued in a fair and non-discriminatory way.

Where the relevant regulatory authority has not approved a basis for the calculation of losses for a period of time for which the ITC mechanism applies, the value of losses for the purposes of the ITC mechanism shall be estimated by ENTSO for Electricity.

## **5. Compensation for provision of infrastructure for cross-border flows of electricity**

5.1. Following a proposal from the Agency made in accordance with point 5.3, the Commission shall determine the annual cross-border infrastructure compensation sum which shall be apportioned among TSOs as compensation for the costs incurred as a result of making infrastructure available to host cross-border flows of electricity. If the Commission disagrees with the proposal of the Agency, it shall ask the Agency for a second opinion.

5.2. The annual cross-border infrastructure compensation sum shall be apportioned amongst transmission system operators responsible for national transmission systems in proportion to:

- (1) transit factor, referring to transits on that national transmission system state as a proportion of total transits on all national transmission systems;
- (2) load factor, referring to the square of transits of electricity, in proportion to load plus transits on that national transmission system relative to the square of transits of electricity in proportion to load plus transit for all national transmission systems.

The transit factor shall be weighted 75% and the load factor 25%.

5.3. The Agency shall make the proposal on the annual cross-border infrastructure compensation sum referred to in point 5.1 based on a Union-wide assessment of the infrastructure of electricity transmission associated with facilitating cross-border flows of electricity. The Agency shall undertake its best endeavours to carry out an assessment within two years of the date of application of this Regulation. ENTSO for Electricity shall provide the Agency with all assistance necessary for the purposes of carrying out this assessment.

This assessment shall consist of a technical and economic assessment of the forward-looking long-run average incremental costs on an annual basis of making such electricity transmission infrastructure available for cross-border flows of electricity over the relevant period, and shall be based on recognised standard-costing methodologies.

Where infrastructure is financed by sources other than charges for access to networks applied in accordance with Article 14 of Regulation (EC) No 714/2009 the assessment of costs of making infrastructure available for cross-border flows of electricity shall be appropriately adjusted to reflect this.

This Union-wide assessment of the electricity transmission infrastructure shall include infrastructure in all Member States and third countries participating in the ITC mechanism and in systems operated

by transmission system operators who have concluded multi-party agreements referred to in point 3.

5.4. Until such time as the Agency has carried out the assessment referred to in point 5.3 and the Commission has determined the annual cross-border infrastructure compensation sum in accordance with point 5.1, the annual cross-border infrastructure compensation sum shall be EUR 100 000 000.

5.5. When making the proposal referred to in point 5.1, the Agency shall also provide its opinion to the Commission as to suitability of using long run average incremental costs for the assessment of the costs of making infrastructure available for hosting cross-border flows of electricity.

## **6. Contributions to the ITC Fund**

6.1. The transmission system operators shall contribute to the ITC fund in proportion to the absolute value of net flows onto and from their national transmission system as a share of the sum of the absolute value of net flows onto and from all national transmission systems.

## **7. Transmission system use fee on third country imports and exports of electricity.**

7.1. A transmission system use fee shall be paid on all scheduled imports and exports of electricity from all third countries where:

(1) that country has not concluded agreement with the Union whereby it has adopted and is applying Union law in the field of electricity; or,

(2) the transmission system operator responsible for the system from which electricity is imported or to which electricity is exported has not concluded a multi-party agreement referred to in point 3.

This fee shall be expressed in Euros per megawatt hour.

7.2. Each participant in the ITC Mechanism shall levy the transmission system use fee on scheduled imports and exports of electricity between the national transmission system and the transmission system of the third country.

7.3. The transmission system use fee for each year shall be calculated in advance by ENTSO for Electricity. It shall be set at the estimated contribution per megawatt hour transmission system operators from a participating country would make to the ITC Fund based on projected cross-border flows of electricity for the relevant year.

## PART B

### Guidelines for A Common Regulatory Approach to Transmission Charging

1. Annual average transmission charges paid by producers in each **Contracting Party**<sup>6</sup> shall be within the ranges set out in point 3.

2. Annual average transmission charges paid by producers is annual total transmission tariff charges paid by producers divided by the total measured energy injected annually by producers to the transmission system of a **Contracting Party**.

For the calculation set out at Point 3, transmission charges shall exclude:

- (1) charges paid by producers for physical assets required for connection to the system or the upgrade of the connection;
- (2) charges paid by producers related to ancillary services;
- (3) specific system loss charges paid by producers.

3. The value of the annual average transmission charges paid by producers shall be within a range of 0 to 0,5 EUR/MWh, except those applying in Denmark, Sweden, Finland, Romania Ireland, Great Britain and Northern Ireland.

The value of the annual average transmission charges paid by producers in Denmark, Sweden and Finland shall be within a range of 0 to 1,2 EUR/MWh.

Annual average transmission charges paid by producers in Ireland, Great Britain and Northern Ireland shall be within a range of 0 to 2,5 EUR/MWh, and in Romania within a range of 0 to 2,0 EUR/MWh.

4. The Agency shall monitor the appropriateness of the ranges of allowable transmission charges, taking particular account of their impact on the financing of transmission capacity needed for Member States to achieve their targets under the Directive 2009/28/EC of the European Parliament and of the Council and their impact on system users in general.

5. By 1 January 2014 the Agency shall provide its opinion to the Commission as to the appropriate range or ranges of charges for the period after 1 January 2015.

---

<sup>6</sup> Decision 2013/01/PHLG-EnC, incorporating this Regulation is addressed to the Contracting Parties.

## **REGULATION (EU) 543/2013 of 14 June 2013 on submission and publication of data in electricity markets and amending Annex I to Regulation (EC) 714/2009**

Incorporated and adapted by Permanent High Level Group Decision 2015/01/PHLG-EnC of 24 June 2015.

*The adaptations made by Permanent High Level Group Decision 2015/01/PHLG-EnC are highlighted in **bold and blue**.*

Whereas:

(1) Regulation (EC) No 714/2009, and in particular Article 15 thereof and point 5 of the Guidelines on the management and allocation of available transfer capacity of interconnections between national systems, set out in Annex I to that Regulation, lays down requirements for Transmission System Operators (TSOs) to publish data on the availability of networks, capacities of cross-border interconnectors and generation, load and network outages.

(2) Article 4(4) of Regulation (EU) No 1227/2011 of the European Parliament and of the Council of 25 October 2011 on wholesale energy market integrity and transparency recognises that publication of inside information in accordance with Regulation (EC) No 714/2009 or guidelines adopted pursuant to it constitute simultaneous, complete and effective public disclosure.

(3) The availability of such data is indispensable for market participants' ability to take efficient production, consumption and trading decisions. Deeper market integration and the rapid development of intermittent renewable energy generation sources such as wind and solar require the disclosure of complete, timely available, high quality and easily digestible information relating to supply and demand fundamentals.

(4) The timely availability of complete sets of data on fundamentals should also increase the security of energy supplies. It should allow market parties to precisely match supply and demand reducing the risk for black-outs. As a result TSOs should be able to better control their networks and operate them under more predictable and secure conditions.

(5) Current transparency measures do not fully satisfy these criteria. In addition, relevant market information is unevenly distributed among market participants with large incumbent players having exclusive access to information in relation to their own assets putting new market participants or participants without own assets at a disadvantage.

(6) Market participants should be provided with timely information on the expected consumption. This information should be regularly updated and be provided for different timeframes. The actual outturn of the expected consumption should also be made available shortly after real time.

(7) The planned and unplanned unavailability of power generation and consumption units is one of the most important supply-demand relevant information for market participants. Market participants and TSOs need to be provided with detailed information on where, when and why units are not or will not be available to generate or consume and when they are expected to return in operation. This should also help TSOs to better reallocate reserves reducing the probability for black-outs.

(8) Market participants and TSOs should also receive detailed information about the overall installed generation capacity, estimations about total scheduled generation, including separately for intermittent generation, and unit level data about actual generation of larger production facilities.

(9) In order to be able to move power from where it is available to where it is most needed and adjust portfolios accordingly, the market should be provided with information about planned and unplanned unavailability of existing cross-border transmission infrastructure and plans about infrastructure developments. TSOs should also provide and regularly update data on planned and offered cross-border transfer capacities for different time horizons as well as information related to the allocation and use of capacities.

(10) Through the rapid deployment of intermittent generation sources away from consumption centres, transmission infrastructure has increasingly got congested in large parts of Europe. To relieve congestions TSOs have increasingly intervened in market operations instructing market participants to change their generation or trading commitments. In order to enable the market to understand where and why congestion management measures have become necessary, TSOs need to provide timely, detailed and reasoned information about their actions.

(11) Even after careful planning producers, suppliers and traders may find themselves out of balance and be exposed to TSOs balancing and settlement regime. In order to optimally mitigate imbalance risk market participants need accurate, clear and timely information about balancing markets. TSOs should provide such information in a comparable format across borders including details about the reserves they have contracted, prices paid and volumes activated for balancing purposes.

(12) TSOs are often the primary source of relevant fundamental information. They are also used to collect and assess large amounts of information for system operation purposes. In order to provide an overall view of relevant information across the Union, TSOs should facilitate the collection, verification and processing of data and the European Network of Transmission System Operators for Electricity (the ENTSO for Electricity) should make the data available to the public through a central information transparency platform. In order to make best use of existing sources of transparency, the ENTSO for Electricity should be able to receive information for publication through third parties such as power exchanges and transparency platforms.

(13) Annex I to Regulation (EC) No 714/2009 should therefore be amended accordingly.

(14) This Regulation has been adopted on the basis of Regulation (EC) No 714/2009 which it supplements and of which it forms an integral part. References to Regulation (EC) No 714/2009 in other legal acts shall be understood as also referring to this Regulation.

(15) The measures provided for in this Regulation are in accordance with the opinion of the Committee referred to in Article 23(1) of Regulation (EC) No 714/2009.

## **Article 1**

### **Subject matter**

This Regulation lays down the minimum common set of data relating to generation, transportation and consumption of electricity to be made available to market participants. It also provides for a central collection and publication of the data.

## **Article 2**

### **Definitions**

For the purposes of this Regulation, the definitions in Article 2 of Regulation (EC) No 714/2009 shall apply. In addition, the following definitions shall apply:

- (1) 'balancing reserves' mean all resources, if procured *ex ante* or in real time, or according to legal obligations, which are available to the TSO for balancing purposes;
- (2) 'balancing time unit' means the time period for which the price for balancing reserves is established;
- (3) 'bidding zone' means the largest geographical area within which market participants are able to exchange energy without capacity allocation;
- (4) 'capacity allocation' means the attribution of cross zonal capacity;
- (5) 'consumption unit' means a resource which receives electrical energy for its own use, excluding TSOs and Distribution Systems Operators (DSOs);
- (6) 'control area' means a coherent part of the interconnected system, operated by a single system operator and shall include connected physical loads and/or generation units if any;
- (7) 'coordinated net transmission capacity' means a capacity calculation method based on the principle of assessing and defining *ex ante* a maximum energy exchange between adjacent bidding zones;
- (8) 'critical network element' means a network element either within a bidding zone or between bidding zones taken into account in the capacity calculation process, limiting the amount of power that can be exchanged;
- (9) 'cross-control area balancing' means a balancing scheme where a TSO can receive bids for activation coming from other TSOs' areas. It does not include re-dispatching or the delivery of emergency energy;
- (10) 'cross zonal capacity' means the capability of the interconnected system to accommodate energy transfer between bidding zones;
- (11) 'currency' is euro if at least one part of the bidding zone(s) concerned is part of a country in which euro is a legal tender. In any other case it is the local currency;
- (12) 'cut-off time' means the point in time where TSOs have to confirm all matched nominations to the market. The cut-off time refers not only to daily or intra daily markets but also to the different markets that cover imbalance adjustments and reserve allocation;
- (13) 'countertrading' means a cross zonal exchange initiated by system operators between two bidding zones to relieve physical congestion;
- (14) 'data provider' means the entity that is sending the data to the central information transparency platform;
- (15) 'explicit allocation' means the allocation of cross zonal capacity only, without the energy transfer;
- (16) 'flow based parameters' mean the available margins on critical network elements with associated power transfer distribution factors;
- (17) 'generation unit' means a single electricity generator belonging to a production unit;

- (18) 'implicit allocation' means a congestion management method in which energy is obtained at the same time as cross zonal capacity;
- (19) 'market time unit' means the period for which the market price is established or the shortest possible common time period for the two bidding zones, if their market time units are different;
- (20) 'offered capacity' means the cross zonal capacity offered by the transmission capacity allocator to the market;
- (21) 'planned' means an event known *ex ante* by the primary owner of the data;
- (22) 'power transfer distribution factor' means a representation of the physical flow on a critical network element induced by the variation of the net position of a bidding zone;
- (23) 'primary owner of the data' means the entity which creates the data;
- (24) 'production unit' means a facility for generation of electricity made up of a single generation unit or of an aggregation of generation units;
- (25) 'profile' means a geographical boundary between one bidding zone and several neighbouring bidding zones;
- (26) 'redispatching' means a measure activated by one or several system operators by altering the generation and/or load pattern in order to change physical flows in the transmission system and relieve a physical congestion;
- (27) 'total load', including losses without power used for energy storage, means a load equal to generation and any imports deducting any exports and power used for energy storage;
- (28) 'transmission capacity allocator' means the entity empowered by TSOs to manage the allocation of cross zonal capacities;
- (29) 'vertical load' means the total amount of power flowing out of the transmission network to the distribution networks, to directly connected final customers or to the consuming part of generation;
- (30) 'year-ahead forecast margin' means the difference between the yearly forecast of available generation capacity and the yearly forecast of maximum total load taking into account the forecast of total generation capacity, the forecast of availability of generation and the forecast of reserves contracted for system services;
- (31) 'time' means the local time in Brussels.

### **Article 3<sup>1</sup>**

#### **Establishment of a central information transparency platform**

1. A central information transparency platform shall be established and operated in an efficient and cost effective manner within the European Network of Transmission System Operators for Electricity (the 'ENTSO for Electricity'). The ENTSO for Electricity shall publish on the central information transparency platform all data which TSOs are required to submit to the ENTSO for Electricity in accordance with this Regulation.

The central information transparency platform shall be available to the public free of charge through the internet and shall be available at least in English.

---

<sup>1</sup> Adapted by Article 3(1) of Decision 2015/01/PHLG-EnC.

The data shall be up to date, easily accessible, downloadable and available for at least five years. Data updates shall be time-stamped, archived and made available to the public.

2. <...>

3. <...>

#### **Article 4**

##### **Submission and publication of data**

1. Primary owners of data shall submit data to TSOs in accordance with Articles 6 to 17. They shall ensure that the data they provide to TSOs, or where provided for in accordance with paragraph 2 to data providers, are complete, of the required quality and provided in a manner that allows TSOs or data providers to process and deliver the data to the ENTSO for Electricity in sufficient time to allow the ENTSO for Electricity to meet its obligations under this Regulation in relation to the timing of the publication of information.

TSOs, and where relevant data providers, shall process the data they receive and provide them to the ENTSO for Electricity in due time for publication.

2. Primary owners of data may fulfil their obligation laid down in paragraph 1 by submitting data directly to the central information transparency platform provided they use a third party acting as data provider on their behalf. This way of submitting data shall be subject to the prior agreement of the TSO in whose control area the primary owner is located. When providing its agreement the TSO shall assess whether the data provider fulfils the requirements referred to in points (b) and (c) of Article 5, first subparagraph.

3. TSOs shall be considered as primary owners of data for the purposes of Articles 6 to 17, except when stated otherwise.

4. In case a bidding zone consists of several control areas in different **Contracting Parties**, the ENTSO for Electricity shall publish the data referred to in paragraph 1 separately for the concerned **Contracting Parties**.

5. Without prejudice to the obligations of the TSOs and of the ENTSO for Electricity laid down in paragraph 1 and Article 3, data can also be published on TSOs' or other parties' websites.

6. National regulatory authorities shall ensure that the primary owners of the data, TSOs and data providers comply with their obligations under this Regulation.

#### **Article 5<sup>2</sup>**

##### **Manual of procedures**

The ENTSO for Electricity shall develop a manual specifying:

(a) details and format of the submission of data laid down in Article 4(1);

(b) standardised ways and formats of data communication and exchange between primary owners of data, TSOs, data providers and the ENTSO for Electricity;

<sup>2</sup> Adapted by Article 3(2) of Decision 2015/01/PHLG-EnC.

(c) technical and operational criteria which data providers would need to fulfil when providing data to the central information transparency platform;

(d) appropriate classification of production types referred to in Articles 14(1), 15(1) and 16(1).

<...>

## **Article 6**

### **Information on total load**

1. For their control areas, TSOs shall calculate and submit the following data to the ENTSO for Electricity for each bidding zone:

(a) the total load per market time unit;

(b) a day-ahead forecast of the total load per market time unit;

(c) a week-ahead forecast of the total load for every day of the following week, which shall for each day include a maximum and a minimum load value;

(d) a month-ahead forecast of the total load for every week of the following month, which shall include, for a given week, a maximum and a minimum load value;

(e) a year-ahead forecast of the total load for every week of the following year, which shall for a given week include a maximum and a minimum load value.

2. The information referred to:

(a) in point (a) of paragraph 1 shall be published no later than one hour after the operating period;

(b) in point (b) of paragraph 1 shall be published no later than two hours before the gate closure of the day-ahead market in the bidding zone and be updated when significant changes occur;

(c) in point (c) of paragraph 1 shall be published each Friday no later than two hours before the gate closure of the day-ahead market in the bidding zone and be updated when significant changes occur;

(d) in point (d) of paragraph 1 shall be published no later than one week before the delivery month and be updated when significant changes occur;

(e) in point (e) of paragraph 1 shall be published no later than the 15th calendar day of the month before the year to which the data relates.

3. Generation units located within a TSO's control area shall provide that TSO with all the relevant information required to calculate the data referred to in point (a) of paragraph 1.

Generation units shall be considered as primary owners of the relevant information they provide.

4. Distribution system operators (DSO), located within a TSO's control area shall provide that TSO with all the relevant information required to calculate the data referred to in points (b) to (e) of paragraph 1.

DSOs shall be considered as primary owners of the relevant information they provide.

### **Article 7**

#### **Information relating to the unavailability of consumption units**

1. For their control areas, TSOs shall provide the following information to the ENTSO for Electricity:

(a) the planned unavailability of 100 MW or more of a consumption unit, including changes of 100 MW or more in the planned unavailability of consumption units, lasting at least one market time unit, specifying:

- bidding zone,
- available capacity per market time unit during the event,
- reason for the unavailability,
- the estimated start and end date (day, hour) of the change in availability;

(b) changes in actual availability of a consumption unit with a power rating of 100 MW or more, specifying:

- bidding zone,
- available capacity per market time unit during the event,
- reason for the unavailability,
- the start date and the estimated end date (day, hour) of the change in availability.

2. The information laid down in point (a) of paragraph 1 shall be published in aggregated form per bidding zone indicating the sum of unavailable consumption capacity per market time unit during a given period as soon as possible but no later than one hour after the decision regarding the planned unavailability is made.

The information laid down point (b) of paragraph 1 shall be published in aggregated form per bidding zone indicating the sum of unavailable consumption capacity per market time unit during a given period as soon as possible but no later than one hour after the change in actual availability.

3. Consumption units located in a TSO's control area shall calculate and submit the data laid down in paragraph 1 to that TSO.

The consumption units shall be considered as primary owner of the data they submit.

### **Article 8**

#### **Year-ahead forecast margin**

1. For their control areas, TSOs shall calculate and provide for each bidding zone the year-ahead forecast margin evaluated at the local market time unit to the ENTSO for Electricity.

The information shall be published one week before the yearly capacity allocation but no later than the 15th calendar day of the month before the year to which the data relates.

2. Generation units and DSOs, located within a TSO's control area shall provide that TSO with any relevant information required to calculate the data referred to in paragraph 1.

Generation units and DSOs shall be considered as primary owners of the data they submit.

## **Article 9**

### **Transmission infrastructure**

TSOs shall establish and provide information on future changes to network elements and interconnector projects including expansion or dismantling in their transmission grids within the next three years, to the ENTSO for Electricity. This information shall only be given for measures expected to have an impact of at least 100 MW on cross zonal capacity between bidding zones or on profiles at least during one market time unit. The information shall include:

- (a) the identification of the assets concerned;
- (b) the location;
- (c) type of asset;
- (d) the impact on interconnection capacity per direction between the bidding zones;
- (e) the estimated date of completion. The information shall be published one week before the yearly capacity allocation but no later than the 15th calendar day of the month before the year to which the allocation relates. The information shall be updated with relevant changes before the end of March, the end of June and the end of September of the year to which the allocation relates.

## **Article 10**

### **Information relating to the unavailability of transmission infrastructure**

1. For their control areas TSOs shall calculate and provide to the ENTSO for Electricity:

- (a) the planned unavailability, including changes in the planned unavailability of interconnections and in the transmission grid that reduce cross zonal capacities between bidding zones by 100 MW or more during at least one market time unit, specifying:
  - the identification of the assets concerned,
  - the location,
  - the type of asset,
  - the estimated impact on cross zonal capacity per direction between bidding zones,
  - reasons for the unavailability,
  - the estimated start and end date (day, hour) of the change in availability;
- (b) changes in the actual availability of interconnections and in the transmission grid that reduce cross zonal capacities between bidding zones by 100 MW or more during at least one market time unit, specifying:
  - the identification of the assets concerned,
  - the location,
  - the type of asset,
  - the estimated impact on cross zonal capacity per direction between bidding zones,
  - reasons for the unavailability,
  - the start and estimated end date (day, hour) of the change in availability;

(c) changes in the actual availability of off-shore grid infrastructure that reduce wind power feed-in by 100 MW or more during at least one market time unit, specifying:

- the identification of the assets concerned,
- the location,
- the type of asset,
- the installed wind power generation capacity (MW) connected to the asset,
- wind power fed in (MW) at the time of the change in the availability,
- reasons for the unavailability,
- the start and estimated end date (day, hour) of the change in availability.

2. The information laid down in point (a) of paragraph 1 shall be published as soon as possible, but no later than one hour after the decision regarding the planned unavailability is made.

3. The information laid down in points (b) and (c) of paragraph 1 shall be published as soon as possible but no later than one hour after the change in actual availability.

4. For the information laid down in points (a) and (b) of paragraph 1 TSOs may choose not to identify the asset concerned and specify its location if it is classified as sensitive critical infrastructure protection related information in their **Contracting Parties** as provided for in point (d) of Article 2 of Council Directive 2008/114/EC. This is without prejudice to their other obligations laid down in paragraph 1 of this Article.

### **Article 11**

#### **Information relating to the estimation and offer of cross zonal capacities**

1. For their control areas TSOs or, if applicable, transmission capacity allocators, shall calculate and provide the following information to the ENTSO for Electricity sufficiently in advance of the allocation process:

- (a) the forecasted and offered capacity (MW) per direction between bidding zones in case of coordinated net transmission capacity based capacity allocation; or
- (b) the relevant flow based parameters in case of flow based capacity allocation.

TSOs or, if applicable, transmission capacity allocators shall be considered as the primary owners of the information they calculate and provide.

2. The information laid down in paragraph 1(a) shall be published as set out in the Annex.

3. In relation to direct current links, TSOs shall provide updated information on any restrictions placed on the use of available cross-border capacity including through the application of ramping restrictions or intraday transfer limits not later than one hour after the information is known to the ENTSO for Electricity.

Operators of direct current links shall be considered as primary owners of the updated information they provide.

4. TSOs or, if applicable, transmission capacity allocators, shall provide a yearly report to the ENTSO for Electricity indicating:

- (a) the main critical network elements limiting the offered capacity;
- (b) the control area(s) which the critical network elements belong to;
- (c) the extent to which relieving the critical network elements would increase the offered capacity;
- (d) all possible measures that could be implemented to increase the offered capacity, together with their estimated costs.

When preparing the report TSOs may choose not to identify the asset concerned and specify its location if it is classified as sensitive critical infrastructure protection related information in their **Contracting Parties** as provided for in point (d) of Article 2 of Directive 2008/114/EC.

TSOs or, if applicable, transmission capacity allocators shall be considered as primary owners of the report they provide.

## **Article 12**

### **Information relating to the use of cross zonal capacities**

1. For their control areas TSOs shall calculate and provide the following information to the ENTSO for Electricity:

- (a) in case of explicit allocations, for every market time unit and per direction between bidding zones:
  - the capacity (MW) requested by the market,
  - capacity (MW) allocated to the market,
  - the price of the capacity (Currency/MW),
  - the auction revenue (in Currency) per border between bidding zones;
- (b) for every market time unit and per direction between bidding zones the total capacity nominated;
- (c) prior to each capacity allocation the total capacity already allocated through previous allocation procedures per market time unit and per direction;
- (d) for every market time unit the day-ahead prices in each bidding zone (Currency/MWh);
- (e) in case of implicit allocations, for every market time unit the net positions of each bidding zone (MW) and the congestion income (in Currency) per border between bidding zones;
- (f) scheduled day-ahead commercial exchanges in aggregated form between bidding zones per direction and market time unit;
- (g) physical flows between bidding zones per market time unit;
- (h) cross zonal capacities allocated between bidding zones in **Contracting Parties** and third countries per direction, per allocated product and period.

2. The information laid down:

- (a) in points (a) and (e) of paragraph 1 shall be published no later than one hour after each capacity allocation;
- (b) in point (b) of paragraph 1 shall be published no later than one hour after each round of nomination;
- (c) in point (c) of paragraph 1 shall be published at the latest when publication of offered capacity figures become due as set out in the Annex;

- (d) in point (d) of paragraph 1 shall be published no later than one hour after gate closure;
- (e) in point (f) of paragraph 1 shall be published every day no later than one hour after the last cut-off time and, if applicable, shall be updated no later than two hours after each intra-day nomination process;
- (f) in point (g) of paragraph 1 shall be published for each market time unit as closely as possible to real time but no later than one hour after the operational period;
- (g) in point (h) of paragraph 1 shall be published no later than one hour after the allocation.
3. Transmission capacity allocators, or where applicable power exchanges, shall provide the TSOs with all the relevant information required to calculate the data laid down in paragraph 1. Transmission capacity allocators shall be considered as primary owners of the information they provide. Power exchanges shall be considered primary owners of the information they provide.

### **Article 13**

#### **Information relating to congestion management measures**

1. For their control areas TSOs shall provide the following information to the ENTSO for Electricity:
- (a) information relating to redispatching per market time unit, specifying:
- the action taken (that is to say production increase or decrease, load increase or decrease),
  - the identification, location and type of network elements concerned by the action,
  - the reason for the action,
  - capacity affected by the action taken (MW);
- (b) information relating to countertrading per market time unit, specifying:
- the action taken (that is to say cross-zonal exchange increase or decrease),
  - the bidding zones concerned,
  - the reason for the action,
  - change in cross-zonal exchange (MW);
- (c) the costs incurred in a given month from actions referred to in points (a) and (b) and from any other remedial action.
2. The information laid down:
- (a) in points (a) and (b) of paragraph 1 shall be published as soon as possible but no later than one hour after the operating period, except for the reasons which shall be published as soon as possible but not later than one day after the operating period;

### **Article 14**

#### **Forecast generation**

1. For their control areas, TSOs shall calculate and provide the following information to the ENTSO

for Electricity:

(a) the sum of generation capacity (MW) installed for all existing production units equalling to or exceeding 1 MW installed generation capacity, per production type;

(b) information about production units (existing and planned) with an installed generation capacity equalling to or exceeding 100 MW. The information shall contain:

- the unit name,
- the installed generation capacity (MW),
- the location,
- the voltage connection level,
- the bidding zone,
- the production type;

(c) an estimate of the total scheduled generation (MW) per bidding zone, per each market time unit of the following day;

(d) a forecast of wind and solar power generation (MW) per bidding zone, per each market time unit of the following day.

2. The information laid down:

(a) in point (a) of paragraph 1 shall be published annually no later than one week before the end of the year;

(b) in point (b) of paragraph 1 shall be published annually for the three following years no later than one week before the beginning of the first year to which the data relates;

(c) in point (c) of paragraph 1 shall be published no later than 18.00 Brussels time, one day before actual delivery takes place;

(d) in point (d) of paragraph 1 shall be published no later than 18.00 Brussels time, one day before actual delivery takes place. The information shall be regularly updated and published during intra-day trading with at least one update to be published at 8.00 Brussels time on the day of actual delivery. The information shall be provided for all bidding zones only in **Contracting Parties** with more than 1% feed-in of wind or solar power generation per year or for bidding zones with more than 5% feed-in of wind or solar power generation per year.

3. Production units located in a TSO's control area shall provide that TSO with all the relevant information required to calculate the data laid down in paragraph 1.

Production units shall be considered as primary owners of the relevant information they provide.

## **Article 15**

### **Information relating to the unavailability of generation and production units**

1. For their control areas, TSOs shall provide the following information to the ENTSO for Electricity:

(a) the planned unavailability of 100 MW or more of a generation unit including changes of 100 MW or more in the planned unavailability of that generation unit, expected to last for at least one market time unit up to three years ahead, specifying:

- the name of the production unit,
  - the name of the generation unit,
  - location,
  - bidding zone,
  - installed generation capacity (MW),
  - the production type,
  - available capacity during the event,
  - reason for the unavailability,
  - start date and estimated end date (day, hour) of the change in availability;
- (b) changes of 100 MW or more in actual availability of a generation unit, expected to last for at least one market time unit, specifying:
- the name of the production unit,
  - the name of the generation unit,
  - location,
  - bidding zone,
  - installed generation capacity (MW),
  - the production type,
  - available capacity during the event,
  - reason for the unavailability, and
  - start date and estimated end date (day, hour) of the change in availability;
- (c) the planned unavailability of a production unit of 200 MW or more including changes of 100 MW or more in the planned unavailability of that production unit, but not published in accordance with subparagraph (a), expected to last for at least one market time unit up to three years ahead, specifying:
- the name of the production unit,
  - location,
  - bidding zone,
  - installed generation capacity (MW),
  - the production type,
  - available capacity during the event,
  - reason for the unavailability,
  - start date and estimated end date (day, hour) of the change in availability;
- (d) changes of 100 MW or more in actual availability of a production unit with an installed generation capacity of 200 MW or more, but not published in accordance with subparagraph (b), expected to last for at least one market time unit, specifying:
- the name of the production unit,
  - location,
  - bidding zone,

- installed generation capacity (MW),
  - the production type,
  - available capacity during the event,
  - reason for the unavailability, and
  - start date and estimated end date (day, hour) of the change in availability.
2. The information laid down in points (a) and (c) of paragraph 1 shall be published as soon as possible, but no later than one hour after the decision regarding the planned unavailability is made. The information laid down in points (b) and (d) of paragraph 1 shall be published as soon as possible but no later than one hour after the change in actual availability.
3. Generation units located in a TSO's control area shall provide that TSO with the data laid down in paragraph 1.
- Generation units shall be considered as primary owners of the data they provide.

### **Article 16**

#### **Actual generation**

1. For their control areas, TSOs shall calculate and provide the following information to the ENTSO for Electricity:
- (a) actual generation output (MW) per market time unit and per generation unit of 100 MW or more installed generation capacity;
  - (b) aggregated generation output per market time unit and per production type;
  - (c) actual or estimated wind and solar power generation (MW) in each bidding zone per market time unit;
  - (d) aggregated weekly average filling rate of all water reservoir and hydro storage plants (MWh) per bidding zone including the figure for the same week of the previous year.
2. The information laid down:
- (a) in point (a) of paragraph 1 shall be published five days after the operational period;
  - (b) in point (b) of paragraph 1 shall be published no later than one hour after the operational period;
  - (c) in point (c) of paragraph 1 shall be published no later than one hour after the operational period and be updated on the basis of measured values as soon as they become available. The information shall be provided for all bidding zones only in **Contracting Parties** with more than 1% feed-in of wind or solar power generation per year or for bidding zones with more than 5% feed-in of wind or solar power generation per year;
  - (d) in point (d) of paragraph 1 shall be published on the third working day following the week to which the information relates. The information shall be provided for all bidding zones only in **Contracting Parties** with more than 10% feed-in of this type of generation per year or for bidding zones with more than 30% feed-in of this type of generation per year.
3. Generation units and production units located within a TSOs' control area shall provide that TSO with all the relevant information to calculate the data laid down in paragraph 1.

Generation units and production units respectively shall be considered as primary owners of the relevant information they provide.

### **Article 17**

#### **Balancing**

1. For their control areas, TSOs or where applicable operators of balancing markets, where such markets exist shall provide the following information to the ENTSO for Electricity:

(a) rules on balancing including:

- processes for the procurement of different types of balancing reserves and of balancing energy,
- the methodology of remuneration for both the provision of reserves and activated energy for balancing,
- the methodology for calculating imbalance charges,
- if applicable, a description on how cross-border balancing between two or more control areas is carried out and the conditions for generators and load to participate;

(b) the amount of balancing reserves under contract (MW) by the TSO, specifying:

- the source of reserve (generation or load),
- the type of reserve (e.g. Frequency Containment Reserve, Frequency Restoration Reserve, Replacement Reserve),
- the time period for which the reserves are contracted (e.g. hour, day, week, month, year, etc.);

(c) prices paid by the TSO per type of procured balancing reserve and per procurement period (Currency/MW/period);

(d) accepted aggregated offers per balancing time unit, separately for each type of balancing reserve;

(e) the amount of activated balancing energy (MW) per balancing time unit and per type of reserve;

(f) prices paid by the TSO for activated balancing energy per balancing time unit and per type of reserve; price information shall be provided separately for up and down regulation;

(g) imbalance prices per balancing time unit;

(h) total imbalance volume per balancing time unit;

(i) monthly financial balance of the control area, specifying:

- the expenses incurred to the TSO for procuring reserves and activating balancing energy,
- the net income to the TSO after settling the imbalance accounts with balance responsible parties;

(j) if applicable, information regarding Cross Control Area Balancing per balancing time unit, specifying:

- the volumes of exchanged bids and offers per procurement time unit,
- maximum and minimum prices of exchanged bids and offers per procurement time unit,
- volume of balancing energy activated in the control areas concerned. Operators of balancing markets shall be considered as primary owners of the information they provide.

2. The information laid down:

(a) in point (b) of paragraph 1 shall be published as soon as possible but no later than two hours before the next procurement process takes place;

(b) in point (c) of paragraph 1 shall be published as soon as possible but no later than one hour after the procurement process ends;

(c) in point (d) of paragraph 1 shall be published as soon as possible but no later than one hour after the operating period;

(d) in point (e) of paragraph 1 shall be published as soon as possible but no later than 30 minutes after the operating period. In case the data are preliminary, the figures shall be updated when the data become available;

(e) in point (f) of paragraph 1 shall be published as soon as possible but no later than one hour after the operating period;

(f) in point (g) of paragraph 1 shall be published as soon as possible;

(g) in point (h) of paragraph 1 shall be published as soon as possible but no later than 30 minutes after the operating period. In case the data are preliminary, the figures shall be updated when the data become available;

(h) in point (i) of paragraph 1 shall be published no later than three months after the operational month. In case the settlement is preliminary, the figures shall be updated after the final settlement;

(i) in point (j) of paragraph 1 shall be published no later than one hour after the operating period.

## **Article 18**

### **Liability**

The liability of the primary owner of the data, the data provider and the ENTSO for Electricity under this Regulation shall be limited to cases of gross negligence and/or wilful misconduct. In any event they shall not be liable to compensate the person who uses the data for any loss of profit, loss of business, or any other indirect incidental, special or consequential damages of any kind arising from a breach of their obligations under this Regulation.

## **Article 19**

### **Amendment to Regulation (EC) No 714/2009**

Points 5.5 to 5.9 of Annex I to Regulation (EC) No 714/2009 are deleted with effect from 5 January 2015.

## **Article 20<sup>3</sup>**

This Regulation shall enter into force on the twentieth day following that of its publication in **a dedicated section of the website of the Energy Community**.

---

<sup>3</sup> Adapted by Article 4(3) of Decision 2011/02/MC-EnC.

**Article 4(1) shall apply 18 months after the entry into force of Decision 2015/01/PHLG-EnC.**<sup>4</sup>

This Regulation shall be binding in its entirety and directly applicable in all **Contracting Parties**.

The references to the obligations of the ENTSO for Electricity are applicable upon the agreement of ENTSO for Electricity.<sup>5</sup>

---

<sup>4</sup> Decision 2015/01/PHLG-EnC entered into force on 24 June 2015.

<sup>5</sup> According to Article 2(1)(c) of Decision 2015/01/PHLG-EnC.

## ANNEX

Publication of the information referred to in Article 11(2)

<b>Capacity allocation period</b>	<b>Forecasted cross zonal capacity to be published</b>	<b>Offered capacity to be published</b>
Yearly	One week before the yearly allocation process but no later than 15 December, for all months of the following year	One week before the yearly allocation process but no later than 15 December
Monthly	Two working days before the monthly allocation process for all days of the following month	Two working days before the monthly allocation process
Weekly	Each Friday, for all days of the following week	One day before the weekly allocation process
Day-ahead		One hour before spot market gate closure, for each market time unit
Intra-day		One hour before the first intra-day allocation and then real-time, for each market time unit

## REGULATION (EU) 2016/1388 of 17 August 2016 establishing a network code on demand connection

Incorporated and adapted by Permanent High Level Group Decision 2018/05/PHLG-EnC of 12 January 2018

*The adaptations made by Permanent High Level Group Decision 2018/05/PHLG-EnC are highlighted in **bold and blue***

Whereas:

(1) The swift completion of a fully functioning and interconnected internal energy market is crucial to maintaining security of energy supply, increasing competitiveness and ensuring that all consumers can purchase energy at affordable prices.

(2) Regulation (EC) No 714/2009 sets out non-discriminatory rules governing access to the network for cross-border exchanges in electricity with a view to ensuring the proper functioning of the internal market in electricity. In addition Article 5 of Directive 2009/72/EC of the European Parliament and of the Council requires that Member States or, where Member States have so provided, regulatory authorities ensure, *inter alia*, that objective and non-discriminatory technical rules are developed which establish minimum technical design and operational requirements for the connection to the system. Where requirements constitute terms and conditions for connection to national networks, Article 37(6) of the same Directive requires regulatory authorities to be responsible for fixing or approving at least the methodologies used to calculate or establish them. In order to provide system security within the interconnected transmission system, it is essential to establish a common understanding of the requirements for grid connection applicable to demand facilities and distribution systems, including closed distribution systems. Those requirements that contribute to maintaining, preserving and restoring system security in order to facilitate proper functioning of the internal electricity market within and between synchronous areas, and to achieve cost efficiencies, should be regarded as cross-border network issues and market integration issues.

(3) Harmonised rules for grid connection for demand facilities and distribution systems should be set out in order to provide a clear legal framework for grid connections, facilitate Union-wide trade in electricity, ensure system security, facilitate the integration of renewable electricity sources, increase competition, and allow more efficient use of the network and resources, for the benefit of consumers.

(4) System security cannot be ensured independently from the technical capabilities of all users. Historically, generation facilities have formed the backbone of providing technical capabilities. However, in this regard, demand facilities are expected to play a more pivotal role in the future. Regular coordination at the level of the transmission and distribution networks and adequate performance of the equipment connected to the transmission and distribution networks with sufficient robustness to cope with disturbances and to help to prevent any major disruption or to facilitate restoration of the system after a collapse are fundamental prerequisites.

(5) Regulatory authorities should consider the reasonable costs effectively incurred by system operators in the implementation of this Regulation when fixing or approving transmission or distribution tariffs or their methodologies or when approving the terms and conditions for connection and access to national networks in accordance with Article 37(1) and (6) of Directive 2009/72/EC and with Article

14 of Regulation (EC) No 714/2009.

6) Different synchronous electricity systems in the Union have different characteristics which need to be taken into account when setting the requirements for demand connection. It is therefore appropriate to consider regional specificities when establishing network connection rules as required by Article 8(6) of Regulation (EC) No 714/2009.

(7) In view of the need to provide regulatory certainty, the requirements of this Regulation should apply to new transmission-connected demand facilities, new transmission-connected distribution facilities, new distribution systems and new demand units used by a demand facility or a closed distribution system to provide demand response services to relevant system operators and relevant transmission system operators ('TSOs'). The requirements of this Regulation should not apply to existing transmission-connected demand facilities, existing transmission-connected distribution facilities, existing distribution systems and existing demand units that are or can be used by a demand facility or a closed distribution system to provide demand response services to relevant system operators and relevant TSOs. The requirements of this Regulation also should not apply to new or existing demand facilities connected at the distribution level unless they provide demand response services to relevant system operators and relevant TSOs. However, the requirements of this Regulation should apply in case the relevant regulatory authority or Member State decides otherwise based on evolution of system requirements and a full cost-benefit analysis, or in case a substantial modernisation or replacement of equipment impacting the technical capabilities of an existing transmission-connected demand facility, an existing transmission-connected distribution facility, an existing distribution system, or an existing demand unit within a demand facility or a closed distribution system connected at a voltage level above 1 000 V has been performed.

(8) Demand response is an important instrument for increasing the flexibility of the internal energy market and for enabling optimal use of networks. It should be based on customers' actions or on their agreement for a third party to take action on their behalf. A demand facility owner or a closed distribution system operator ('CDSO') may offer demand response services to the market as well as to system operators for grid security. In the latter case, the demand facility owner or the closed distribution system operator should ensure that new demand units used to provide such services fulfil the requirements set out in this Regulation, either individually or commonly as part of demand aggregation through a third party. In this regard, third parties have a key role in bringing together demand response capacities and can have the responsibility and obligation to ensure the reliability of those services, where those responsibilities are delegated by the demand facility owner and the closed distribution system operator.

(9) The requirements should be based on the principles of non-discrimination and transparency as well as on the principle of optimisation between the highest overall efficiency and lowest total cost for all involved parties. TSOs and distribution system operators ('DSOs') including CDSOs can take those elements into account when defining the requirements in accordance with the provisions of this Regulation, whilst recognising that the thresholds which determine whether a system is a transmission system or a distribution system are established at the national level.

(10) The requirements applicable to a demand facility connected to a transmission system should set out the capabilities at their interfaces and the necessary automated responses and data exchange. These requirements aim at ensuring the operability of the transmission system, and the capacity to utilise the generation and demand response embedded in these networks over system operational

ranges and critical events.

(11) The requirements applicable to a distribution system connected to a transmission system or another distribution system should set out the operational range of these systems and the necessary automated responses and data exchange. These requirements should ensure the effective development and operability of the transmission system, and the capacity to utilise the generation and demand response embedded in these networks over system operational ranges and critical events.

(12) The requirements applicable to a demand unit used by a demand facility or a closed distribution system to provide demand response services to relevant system operators and relevant TSOs should ensure the capacity to use the demand response over system operational ranges thereby minimising critical events.

(13) The administrative burdens and costs associated with providing demand response should be kept within reasonable limits, in particular as regards domestic consumers, who will play an increasingly important role in the transition to low carbon society and their uptake should not be unnecessarily burdened with administrative tasks.

(14) Due to its cross-border impact, this Regulation should aim at the same frequency- related requirements for all voltage levels, at least within a synchronous area. That is necessary because, within a synchronous area, a change in frequency in one Member State would immediately impact frequency and could damage equipment in all other Member States.

(15) Voltage ranges should be coordinated between interconnected systems because they are crucial to secure planning and operation of a power system within a synchronous area. Disconnections because of voltage disturbances have an impact on neighbouring systems. Failure to specify voltage ranges could lead to widespread uncertainty in planning and operation of the system with respect to operation beyond normal operating conditions.

(16) Appropriate and proportionate compliance testing should be introduced so that system operators can ensure operational security. In accordance with Article 37(1)(b) of Directive 2009/72/EC, regulatory authorities are responsible for ensuring that system operators are compliant with this Regulation.

(17) The regulatory authorities, Member States and system operators should ensure that, in the process of developing and approving the requirements for network connection, they are harmonised to the extent possible, in order to ensure full market integration. Established technical standards should be taken into particular consideration in the development of connection requirements.

(18) System operators should not specify technical requirements for equipment that hinder the free movement of goods in the internal market. Where system operators make technical specifications resulting in requirements for the placing on the market of equipment, the respective Member State should follow the procedure referred to in Articles 8 and 9 of Directive 98/34/EC of the European Parliament and of the Council.

(19) A process for derogating from the rules should be set out in this Regulation to take into account local circumstances where exceptionally, for example, compliance with those rules could jeopardise the stability of the local network or where the safe operation of a transmission-connected demand facility, a transmission-connected distribution facility, a distribution system, or a demand unit used by a demand facility or a closed distribution system to provide demand response services to relevant system operators and relevant TSOs, might require operating conditions that are not in line with this Regulation.

(20) Subject to approval by the relevant regulatory authority, or other authority where applicable in a Member State, demand facility owners and relevant system operators should be allowed to propose derogations for certain classes of transmission-connected demand facilities, transmission-connected distribution facilities, distribution systems and demand units used by a demand facility or a closed distribution system to provide demand response services to relevant system operators and relevant TSOs.

(21) According to Article 28 of Directive 2009/72/EC, Member States may provide for the classification of a system which distributes electricity as a closed distribution system in certain circumstances. The provisions of this Regulation should apply to closed distribution systems only where Member States have so provided according to Article 28 of Directive 2009/72/EC.

(22) This Regulation has been adopted on the basis of Regulation (EC) No 714/2009 which it supplements and of which it forms an integral part. References to Regulation (EC) No 714/2009 in other legal acts should be understood as also referring to this Regulation.

(23) The measures provided for in this Regulation are in accordance with the opinion of the Committee referred to in Article 23(1) of Regulation (EC) No 714/2009.

## TITLE I GENERAL PROVISIONS

### *Article 1*

#### **Subject matter**

1. This Regulation establishes a network code which lays down the requirements for grid connection of:

- (a) transmission-connected demand facilities;
- (b) transmission-connected distribution facilities;
- (c) distribution systems, including closed distribution systems;
- (d) demand units, used by a demand facility or a closed distribution system to provide demand response services to relevant system operators and relevant TSOs.

2. This Regulation, therefore, helps to ensure fair conditions of competition in the internal electricity market, to ensure system security and the integration of renewable electricity sources, and to facilitate **Energy Community** -wide trade in electricity.

3. This Regulation also lays down the obligations for ensuring that system operators make appropriate use of the demand facilities' and distribution systems' capabilities in a transparent and non-discriminatory manner to provide a level playing field throughout the **Energy Community**.

### *Article 2*

#### **Definitions**

For the purposes of this Regulation, the definitions in Article 2 of Directive 2012/27/EU of the European Parliament and of the Council, Article 2 of Regulation (EC) No 714/2009, <...>, Article 2 of

Commission Regulation (EU) 2016/631, Article 2 of Commission Regulation (EU) No 543/2013 and Article 2 of Directive 2009/72/EC shall apply.

In addition, the following definitions shall apply:

- (1) 'demand facility' means a facility which consumes electrical energy and is connected at one or more connection points to the transmission or distribution system. A distribution system and/or auxiliary supplies of a power generating module do not constitute a demand facility;
- (2) 'transmission-connected demand facility' means a demand facility which has a connection point to a transmission system;
- (3) 'transmission-connected distribution facility' means a distribution system connection or the electrical plant and equipment used at the connection to the transmission system;
- (4) 'demand unit' means an indivisible set of installations containing equipment which can be actively controlled by a demand facility owner or by a CDSO, either individually or commonly as part of demand aggregation through a third party;
- (5) 'closed distribution system' means a distribution system classified pursuant to Article 28 of Directive 2009/72/EC as a closed distribution system by national regulatory authorities or by other competent authorities, where so provided by the **Contracting Party**, which distributes electricity within a geographically confined industrial, commercial or shared services site and does not supply household customers, without prejudice to incidental use by a small number of households located within the area served by the system and with employment or similar associations with the owner of the system;
- (6) 'main demand equipment' means at least one of the following equipment: motors, transformers, high voltage equipment at the connection point and at the process production plant;
- (7) 'transmission-connected distribution system' means a distribution system connected to a transmission system, including transmission-connected distribution facilities;
- (8) 'maximum import capability' means the maximum continuous active power that a transmission-connected demand facility or a transmission-connected distribution facility can consume from the network at the connection point, as specified in the connection agreement or as agreed between the relevant system operator and the transmission-connected demand facility owner or transmission-connected distribution system operator respectively;
- (9) 'maximum export capability' means the maximum continuous active power that a transmission-connected demand facility or a transmission-connected distribution facility, can feed into the network at the connection point, as specified in the connection agreement or as agreed between the relevant system operator and the transmission-connected demand facility owner or transmission-connected distribution system operator respectively;
- (10) 'low frequency demand disconnection' means an action where demand is disconnected during a low frequency event in order to recover the balance between demand and generation and restore system frequency to acceptable limits;
- (11) 'low voltage demand disconnection' means a restoration action where demand is disconnected during a low voltage event in order to recover voltage to acceptable limits;
- (12) 'on load tap changer' means a device for changing the tap of a winding, suitable for operation while the transformer is energised or on load;

- (13) 'on load tap changer blocking' means an action that blocks the on load tap changer during a low voltage event in order to stop transformers from further tapping and suppressing voltages in an area;
- (14) 'control room' means a relevant system operator's operation centre;
- (15) 'block loading' means the maximum step active power loading of reconnected demand during system restoration after black-out;
- (16) 'demand response active power control' means demand within a demand facility or closed distribution system that is available for modulation by the relevant system operator or relevant TSO, which results in an active power modification;
- (17) 'demand response reactive power control' means reactive power or reactive power compensation devices in a demand facility or closed distribution system that are available for modulation by the relevant system operator or relevant TSO;
- (18) 'demand response transmission constraint management' means demand within a demand facility or closed distribution system that is available for modulation by the relevant system operator or relevant TSO to manage transmission constraints within the system;
- (19) 'demand aggregation' means a set of demand facilities or closed distribution systems which can operate as a single facility or closed distribution system for the purposes of offering one or more demand response services;
- (20) 'demand response system frequency control' means demand within a demand facility or closed distribution system that is available for reduction or increase in response to frequency fluctuations, made by an autonomous response from the demand facility or closed distribution system to diminish these fluctuations;
- (21) 'demand response very fast active power control' means demand within a demand facility or closed distribution system that can be modulated very fast in response to a frequency deviation, which results in a very fast active power modification;
- (22) 'demand response unit document' (DRUD) means a document, issued either by the demand facility owner or the CDSO to the relevant system operator for demand units with demand response and connected at a voltage level above 1 000 V, which confirms the compliance of the demand unit with the technical requirements set out in this Regulation and provides the necessary data and statements, including a statement of compliance.

### **Article 3**

#### **Scope of application**

1. The connection requirements set out in this Regulation shall apply to:
- (a) new transmission-connected demand facilities;
  - (b) new transmission-connected distribution facilities;
  - (c) new distribution systems, including new closed distribution systems;
  - (d) new demand units used by a demand facility or a closed distribution system to provide demand response services to relevant system operators and relevant TSOs.

The relevant system operator shall refuse to allow the connection of a new transmission-connected demand facility, a new transmission-connected distribution facility, or a new distribution system, which does not comply with the requirements set out in this Regulation and which is not covered by a derogation granted by the regulatory authority, or other authority where applicable in a **Contracting Party** pursuant to Article 50. The relevant system operator shall communicate such refusal, by means of a reasoned statement in writing, to the demand facility owner, DSO, or CDSO and, unless specified otherwise by the regulatory authority, to the regulatory authority.

Based on compliance monitoring in accordance with Title III, the relevant TSO shall refuse demand response services subject to Articles 27 to 30 from new demand units not fulfilling the requirements set out in this Regulation.

2. This Regulation shall not apply to:

(a) <...>

(b) storage devices except for pump-storage power generating modules in accordance with Article 5(2).

3. In case of demand facilities or closed distribution systems with more than one demand unit, these demand units shall together be considered as one demand unit if they cannot be operated independently from each other or can reasonably be considered in a combined manner.

#### **Article 4**

##### **Application to existing transmission-connected demand facilities, existing transmission-connected distribution facilities, existing distribution systems and existing demand units used to provide demand response services**

1. Existing transmission-connected demand facilities, existing transmission-connected distribution facilities, existing distribution systems and existing demand units that are or can be used by a demand facility or a closed distribution system to provide demand response services to a relevant system operator or relevant TSO, are not subject to the requirements of this Regulation, except where:

(a) an existing transmission-connected demand facility, an existing transmission-connected distribution facility, an existing distribution system, or an existing demand unit within a demand facility at a voltage level above 1 000 V or a closed distribution system connected at a voltage level above 1 000 V, has been modified to such an extent that its connection agreement must be substantially revised in accordance with the following procedure:

(i) demand facility owners, DSOs, or CDSOs who intend to undertake the modernisation of a plant or replacement of equipment impacting the technical capabilities of the transmission-connected demand facility, the transmission-connected distribution facility, the distribution system, or the demand unit shall notify their plans to the relevant system operator in advance;

(ii) if the relevant system operator considers that the extent of the modernisation or replacement of equipment is such that a new connection agreement is required, the system operator shall notify the relevant regulatory authority or, where applicable, the **Contracting Party**; and

(iii) the relevant regulatory authority or, where applicable, the **Contracting Party** shall decide if the existing connection agreement needs to be revised or a new connection agreement is required

and which requirements of this Regulation shall apply; or

(b) a regulatory authority or, where applicable, a **Contracting Party** decides to make an existing transmission-connected demand facility, an existing transmission-connected distribution facility, an existing distribution system, or an existing demand unit subject to all or some of the requirements of this Regulation, following a proposal from the relevant TSO in accordance with paragraphs 3, 4 and 5.

2. For the purposes of this Regulation, a transmission-connected demand facility, a transmission-connected distribution facility, a distribution system, or a demand unit that is, or can be, used by a demand facility or a closed distribution system to provide demand response services to a relevant system operator or relevant TSO, shall be considered as existing if:

(a) it is already connected to the network on the date of **expiry of the deadline for transposition** of this Regulation; or

(b) the demand facility owner, DSO, or CDSO has concluded a final and binding contract for the purchase of the main demand equipment or the demand unit by two years after **expiry of the deadline for transposition of** the Regulation. The demand facility owner, DSO, or CDSO must notify the relevant system operator and relevant TSO of the conclusion of the contract within 30 months after **expiry of the deadline for transposition of** the Regulation.

The notification submitted by the demand facility owner, DSO, or CDSO to the relevant system operator and the relevant TSO shall at least indicate the contract title, its date of signature and date of entry into force, and the specifications of the main demand equipment or the demand unit to be constructed, assembled or purchased.

A **Contracting Party** may provide that in specified circumstances the regulatory authority may determine whether the transmission-connected demand facility, the transmission-connected distribution facility, the distribution system, or the demand unit is to be considered existing or new.

3. Following a public consultation in accordance with Article 9 and in order to address significant factual changes in circumstances, such as the evolution of system requirements including penetration of renewable energy sources, smart grids, distributed generation or demand response, the relevant TSO may propose to the regulatory authority concerned, or where applicable, to the **Contracting Party** to extend the application of this Regulation to existing transmission-connected demand facilities, existing transmission-connected distribution facilities, existing distribution systems, or existing demand units used by a demand facility or a closed distribution system to provide demand response services to a relevant system operator or relevant TSO.

For that purpose a sound and transparent quantitative cost-benefit analysis shall be carried out, in accordance with Articles 48 and 49. The analysis shall indicate:

(a) the costs, in regard to existing transmission-connected demand facilities, existing transmission-connected distribution facilities, existing distribution systems and existing demand units, of requiring compliance with this Regulation;

(b) the socioeconomic benefit resulting from applying the requirements set out in this Regulation; and

(c) the potential of alternative measures to achieve the required performance.

4. Before carrying out the quantitative cost-benefit analysis referred to in paragraph 3, the relevant TSO shall:

(a) carry out a preliminary qualitative comparison of costs and benefits;

(b) obtain approval from the relevant regulatory authority or, where applicable, the **Contracting Party**.

5. The relevant regulatory authority or, where applicable, the **Contracting Party** shall decide on the extension of the applicability of this Regulation to existing transmission-connected demand facilities, existing transmission-connected distribution facilities, existing distribution systems, or existing demand units, within six months of receipt of the report and the recommendation of the relevant TSO in accordance with paragraph 4 of Article 48. The decision of the regulatory authority or, where applicable, the **Contracting Party** shall be published.

6. The relevant TSO shall take account of the legitimate expectations of demand facility owners, DSOs and CDSOs as part of the assessment of the application of this Regulation to existing transmission-connected demand facilities, existing transmission-connected distribution facilities, existing distribution systems, or existing demand units.

7. The relevant TSO may assess the application of some or all of the provisions of this Regulation to existing transmission-connected demand facilities, existing transmission-connected distribution facilities, existing distribution systems, or existing demand units, every three years in accordance with the requirements and process set out in paragraphs 3 to 5.

### **Article 5**

#### **Application to pump-storage power generating modules and industrial sites**

1. This Regulation shall not apply to pump-storage power generating modules that have both generating and pumping operation mode.

2. Any pumping module within a pump-storage station that only provides pumping mode shall be subject to the requirements of this Regulation and shall be treated as a demand facility.

3. In the case of industrial sites with an embedded power generating module, the system operator of an industrial site, the demand facility owner, the power generating facility owner and the relevant system operator to whose system the industrial site is connected, may agree, in coordination with the relevant TSO, on conditions for disconnection of critical loads from the relevant system. The objective of the agreement shall be to secure production processes of the industrial site in case of disturbed conditions in the relevant system.

### **Article 6**

#### **Regulatory aspects**

1. Requirements of general application to be established by relevant system operators or TSOs under this Regulation shall be subject to approval by the entity designated by the **Contracting Party** and be published. The designated entity shall be the regulatory authority unless otherwise provided by the **Contracting Party**.

2. For site specific requirements to be established by relevant system operators or TSOs under this Regulation, **Contracting Parties** may require approval by a designated entity.

3. When applying this Regulation, **Contracting Parties**, competent entities and system operators shall:

- (a) apply the principles of proportionality and non-discrimination;
- (b) ensure transparency;
- (c) apply the principle of optimisation between the highest overall efficiency and lowest total costs for all parties involved;
- (d) respect the responsibility assigned to the relevant TSO in order to ensure system security, including as required by national legislation;
- (e) consult with relevant DSOs and take account of potential impacts on their system;
- (f) take into consideration agreed European standards and technical specifications

4. The relevant system operator or TSO shall submit a proposal for requirements of general application, or the methodology used to calculate or establish them, for approval by the competent entity within two years of **expiry of the deadline for transposition** of this Regulation.

5. Where this Regulation requires the relevant system operator, relevant TSO, demand facility owner, power generating facility owner, DSO and/or CDSO to seek agreement, they shall endeavour to do so within six months after a first proposal has been submitted by one party to the other parties. If no agreement has been found within this time frame, each party may request the relevant regulatory authority to issue a decision within six months.

6. Competent entities shall take decisions on proposals for requirements or methodologies within six months following the receipt of such proposals.

7. If the relevant system operator or TSO deems an amendment to requirements or methodologies as provided for and approved under paragraph 1 and 2 to be necessary, the requirements provided for in paragraphs 3 to 8 shall apply to the proposed amendment. System operators and TSOs proposing an amendment shall take into account the legitimate expectations, if any, of demand facility owners, DSOs, CDSOs, equipment manufacturers and other stakeholders based on the initially specified or agreed requirements or methodologies.

8. Any party having a complaint against a relevant system operator or a TSO in relation to that relevant system operator's or TSO's obligations under this Regulation may refer the complaint to the regulatory authority which, acting as dispute settlement authority, shall issue a decision within two months after receipt of the complaint. That period may be extended by two months where additional information is sought by the regulatory authority. That extended period may be further extended with the agreement of the complainant. The regulatory authority's decision shall have binding effect unless and until overruled on appeal.

9. Where the requirements under this Regulation are to be established by a relevant system operator that is not a TSO, **Contracting Parties** may provide that instead the TSO be responsible for establishing the relevant requirements.

## **Article 7**

### **Multiple TSOs**

1. Where more than one TSO exists in a **Contracting Party**, this Regulation shall apply to all those

TSOs.

2. **Contracting Parties** may, under the national regulatory regime, provide that the responsibility of a TSO to comply with one or some or all obligations under this Regulation is assigned to one or more specific TSOs.

### **Article 8**

#### **Recovery of costs**

1. The costs borne by system operators subject to network tariff regulation and stemming from the obligations laid down in this Regulation shall be assessed by the relevant regulatory authorities. Costs assessed as reasonable, efficient and proportionate shall be recovered through network tariffs or other appropriate mechanisms.

2. If requested by the relevant regulatory authorities, system operators referred to in paragraph 1 shall, within three months of the request, provide the information necessary to facilitate assessment of the costs incurred.

### **Article 9**

#### **Public consultation**

1. Relevant system operators and relevant TSOs shall carry out a consultation with stakeholders, including the competent authorities of each **Contracting Party** on:

(a) proposals to extend the applicability of this Regulation to existing transmission-connected demand facilities, existing transmission-connected distribution facilities, existing distribution systems and existing demand units in accordance with Article 4(3);

(b) the report prepared in accordance with Article 48(3);

(c) the cost-benefit analysis undertaken in accordance with Article 53(2);

(d) the requirements for demand units specified in accordance with Article 28(2)(c),(e),(f),(k) and (l) and Article 29(2)(c) to (e).

The consultation shall last at least for a period of one month.

2. The relevant system operators or relevant TSOs shall duly take into account the views of the stakeholders resulting from the consultations, prior to the submission of the draft proposal, the report, the cost-benefit analysis, or the requirements for demand units, for approval by the regulatory authority, competent entity or, if applicable, the **Contracting Party**. In all cases, a sound justification for including or not the view of the stakeholders shall be provided and published in a timely manner before, or simultaneously with, the publication of the proposal, the report, the cost-benefit analysis, or the requirements for demand units specified in accordance with Article 28 and Article 29.

## **Article 10**

### **Stakeholder involvement**

The **Energy Community Regulatory Board**, in close cooperation with the European Network of Transmission System Operators for Electricity (ENTSO for Electricity), shall organise stakeholder involvement, regarding the requirements for the grid connection of transmission-connected demand facilities, transmission-connected distribution facilities, distribution systems and demand units used by a demand facility or a closed distribution system to provide demand response services to relevant system operators and relevant TSOs, and other aspects of the implementation of this Regulation. This shall include regular meetings with stakeholders to identify problems and propose improvements notably related to the requirements for grid connection of transmission-connected demand facilities, transmission-connected distribution facilities, distribution systems and demand units used by a demand facility or a closed distribution system to provide demand response services to relevant system operators and relevant TSOs.

## **Article 11**

### **Confidentiality obligations**

1. Any confidential information received, exchanged or transmitted pursuant to this Regulation shall be subject to the conditions of professional secrecy laid down in paragraphs 2, 3 and 4.
2. The obligation of professional secrecy shall apply to any persons, regulatory authorities, or entities subject to the provisions of this Regulation.
3. Confidential information received by the persons, regulatory authorities, or entities referred to in paragraph 2 in the course of their duties may not be divulged to any other person or authority, without prejudice to cases covered by national law, the other provisions of this Regulation or other relevant **Energy Community** law.
4. Without prejudice to cases covered by national or **Energy Community** law, regulatory authorities, entities, or persons who receive confidential information pursuant to this Regulation may use it only for the purpose of carrying out their duties under this Regulation.

## TITLE II

# CONNECTION OF TRANSMISSION-CONNECTED DEMAND FACILITIES, TRANSMISSION-CONNECTED DISTRIBUTION FACILITIES AND DISTRIBUTION SYSTEMS

## CHAPTER 1

### General requirements

#### *Article 12*

#### General frequency requirements

1. Transmission-connected demand facilities, transmission-connected distribution facilities and distribution systems shall be capable of remaining connected to the network and operating at the frequency ranges and time periods specified in Annex I.
2. The transmission-connected demand facility owner or the DSO may agree with the relevant TSO on wider frequency ranges or longer minimum times for operation. If wider frequency ranges or longer minimum times for operation are technically feasible, the consent of the transmission-connected demand facility owner or DSO shall not be unreasonably withheld.

#### *Article 13*

#### General voltage requirements

1. Transmission-connected demand facilities, transmission-connected distribution facilities and transmission-connected distribution systems shall be capable of remaining connected to the network and operating at the voltage ranges and time periods specified in Annex II.
2. Equipment of distribution systems connected at the same voltage as the voltage of the connection point to the transmission system shall be capable of remaining connected to the network and operating at the voltage ranges and time periods specified in Annex II.
3. The voltage range at the connection point shall be expressed by the voltage at the connection point related to reference 1 per unit (pu) voltage. For the 400 kV grid voltage level (or alternatively commonly referred to as 380 kV level), the reference 1 pu value is 400 kV, for other grid voltage levels the reference 1 pu voltage may differ for each system operator in the same synchronous area.
- 4.<...>
- 5.<...>
6. If required by the relevant TSO, a transmission-connected demand facility, a transmission-connected distribution facility, or a transmission-connected distribution system shall be capable of automatic disconnection at specified voltages. The terms and settings for automatic disconnection shall be agreed between the relevant TSO and the transmission-connected demand facility owner or the DSO.
7. With regard to transmission-connected distribution systems with a voltage below 110 kV at the

connection point, the relevant TSO shall specify the voltage range at the connection point that the distribution systems connected to that transmission system shall be designed to withstand. DSOs shall design the capability of their equipment, connected at the same voltage as the voltage of the connection point to the transmission system, to comply with this voltage range.

### **Article 14**

#### **Short-circuit requirements**

1. Based on the rated short-circuit withstand capability of its transmission network elements, the relevant TSO shall specify the maximum short-circuit current at the connection point that the transmission-connected demand facility or the transmission-connected distribution system shall be capable of withstanding.
2. The relevant TSO shall deliver to the transmission-connected demand facility owner or the transmission-connected distribution system operator an estimate of the minimum and maximum short-circuit currents to be expected at the connection point as an equivalent of the network.
3. After an unplanned event, the relevant TSO shall inform the affected transmission-connected demand facility owner or the affected transmission-connected distribution system operator as soon as possible and no later than one week after the unplanned event, of the changes above a threshold for the maximum short-circuit current that the affected transmission-connected demand facility or the affected transmission-connected distribution system shall be able to withstand from the relevant TSO's network in accordance with paragraph 1.
4. The threshold set in paragraph 3 shall either be specified by the transmission-connected demand facility owner for its facility, or by the transmission-connected distribution system operator for its network.
5. Before a planned event, the relevant TSO shall inform the affected transmission-connected demand facility owner or the affected transmission-connected distribution system operator, as soon as possible and no later than one week before the planned event, of the changes above a threshold for the maximum short-circuit current that the affected transmission-connected demand facility or the affected transmission-connected distribution system shall be able to withstand from the relevant TSO's network, in accordance with paragraph 1.
6. The threshold set in paragraph 5 shall either be specified by the transmission-connected demand facility owner for its facility, or by the transmission-connected distribution system operator for its network.
7. The relevant TSO shall request information from a transmission-connected demand facility owner or a transmission-connected distribution system operator concerning the contribution in terms of short-circuit current from that facility or network. As a minimum, the equivalent modules of the network shall be delivered and demonstrated for zero, positive and negative sequences.
8. After an unplanned event, the transmission-connected demand facility owner or the transmission-connected distribution system operator shall inform the relevant TSO, as soon as possible and no later than one week after the unplanned event, of the changes in short-circuit contribution above the threshold set by the relevant TSO.

9. Before a planned event, the transmission-connected demand facility owner or the transmission-connected distribution system operator shall inform the relevant TSO, as soon as possible and no later than one week before the planned event, of the changes in short-circuit contribution above the threshold set by the relevant TSO.

### **Article 15**

#### **Reactive power requirements**

1. Transmission-connected demand facilities and transmission-connected distribution systems shall be capable of maintaining their steady-state operation at their connection point within a reactive power range specified by the relevant TSO, according to the following conditions:

(a) for transmission-connected demand facilities, the actual reactive power range specified by the relevant TSO for importing and exporting reactive power shall not be wider than 48 percent of the larger of the maximum import capacity or maximum export capacity (0,9 power factor import or export of active power), except in situations where either technical or financial system benefits are demonstrated, for transmission-connected demand facilities, by the transmission-connected demand facility owner and accepted by the relevant TSO;

(b) for transmission-connected distribution systems, the actual reactive power range specified by the relevant TSO for importing and exporting reactive power shall not be wider than:

(i) 48 percent (i.e. 0,9 power factor) of the larger of the maximum import capability or maximum export capability during reactive power import (consumption); and

(ii) 48 percent (i.e. 0,9 power factor) of the larger of the maximum import capability or maximum export capability during reactive power export (production);

except in situations where either technical or financial system benefits are proved by the relevant TSO and the transmission-connected distribution system operator through joint analysis;

(c) the relevant TSO and the transmission-connected distribution system operator shall agree on the scope of the analysis, which shall address the possible solutions, and determine the optimal solution for reactive power exchange between their systems, taking adequately into consideration the specific system characteristics, variable structure of power exchange, bidirectional flows and the reactive power capabilities in the distribution system;

(d) the relevant TSO may establish the use of metrics other than power factor in order to set out equivalent reactive power capability ranges;

(e) the reactive power range requirement values shall be met at the connection point;

(f) by way of derogation from point (e), where a connection point is shared between a power generating module and a demand facility, equivalent requirements shall be met at the point defined in relevant agreements or national law.

2. The relevant TSO may require that transmission-connected distribution systems have the capability at the connection point to not export reactive power (at reference 1 pu voltage) at an active power flow of less than 25% of the maximum import capability. Where applicable, **Contracting Parties** may require the relevant TSO to justify its request through a joint analysis with the transmission-con-

nected distribution system operator. If this requirement is not justified based on the joint analysis, the relevant TSO and the transmission-connected distribution system operator shall agree on necessary requirements according to the outcomes of a joint analysis.

3. Without prejudice to point (b) of paragraph 1, the relevant TSO may require the transmission-connected distribution system to actively control the exchange of reactive power at the connection point for the benefit of the entire system. The relevant TSO and the transmission-connected distribution system operator shall agree on a method to carry out this control, to ensure the justified level of security of supply for both parties. The justification shall include a roadmap in which the steps and the timeline for fulfilling the requirement are specified.

4. In accordance with paragraph 3, the transmission-connected distribution system operator may require the relevant TSO to consider its transmission-connected distribution system for reactive power management.

### **Article 16**

#### **Protection requirements**

1. The relevant TSO shall specify the devices and settings required to protect the transmission network in accordance with the characteristics of the transmission-connected demand facility or the transmission-connected distribution system. The relevant TSO and the transmission-connected demand facility owner or the transmission-connected distribution system operator shall agree on protection schemes and settings relevant for the transmission-connected demand facility or the transmission-connected distribution system.

2. Electrical protection of the transmission-connected demand facility or the transmission-connected distribution system shall take precedence over operational controls while respecting system security, health and safety of staff and the public.

3. Protection scheme devices may cover the following elements:

- (a) external and internal short circuit;
- (b) over- and under-voltage at the connection point to the transmission system;
- (c) over- and under-frequency;
- (d) demand circuit protection;
- (e) unit transformer protection;
- (f) back-up against protection and switchgear malfunction.

4. The relevant TSO and the transmission-connected demand facility owner or the transmission-connected distribution system operator shall agree on any changes to the protection schemes relevant for the transmission-connected demand facility or the transmission-connected distribution system, and on the arrangements for the protection schemes of the transmission-connected demand facility or the transmission-connected distribution system.

### **Article 17**

#### **Control requirements**

1. The relevant TSO and the transmission-connected demand facility owner or the transmission-connected distribution system operator shall agree on the schemes and settings of the different control devices of the transmission-connected demand facility or the transmission-connected distribution system relevant for system security.
2. The agreement shall cover at least the following elements:
  - (a) isolated (network) operation;
  - (b) damping of oscillations;
  - (c) disturbances to the transmission network;
  - (d) automatic switching to emergency supply and restoration to normal topology;
  - (e) automatic circuit-breaker re-closure (on 1-phase faults).
3. The relevant TSO and the transmission-connected demand facility owner or the transmission-connected distribution system operator shall agree on any changes to the schemes and settings of the different control devices of the transmission-connected demand facility or the transmission-connected distribution system relevant for system security.
4. With regard to priority ranking of protection and control, the transmission-connected demand facility owner or the transmission-connected distribution system operator shall set the protection and control devices of its transmission-connected demand facility or its transmission-connected distribution system respectively, in compliance with the following priority ranking, organised in decreasing order of importance:
  - (a) transmission network protection;
  - (b) transmission-connected demand facility or transmission-connected distribution system protection;
  - (c) frequency control (active power adjustment);
  - (d) power restriction.

### **Article 18**

#### **Information exchange**

1. Transmission-connected demand facilities shall be equipped according to the standards specified by the relevant TSO in order to exchange information between the relevant TSO and the transmission-connected demand facility with the specified time stamping. The relevant TSO shall make the specified standards publicly available.
2. Transmission-connected distribution system shall be equipped according to the standards specified by the relevant TSO in order to exchange information between the relevant TSO and the transmission-connected distribution system with the specified time stamping. The relevant TSO shall make the specified standards publicly available.

3. The relevant TSO shall specify the information exchange standards. The relevant TSO shall make publicly available the precise list of data required.

### **Article 19**

#### **Demand disconnection and demand reconnection**

1. All transmission-connected demand facilities and transmission-connected distribution systems shall fulfil the following requirements related to low frequency demand disconnection functional capabilities:

(a) each transmission-connected distribution system operator and, where specified by the TSO, transmission-connected demand facility owner, shall provide capabilities that enable automatic 'low frequency' disconnection of a specified proportion of their demand. The relevant TSO may specify a disconnection trigger based on a combination of low frequency and rate-of-change-of-frequency;

(b) the low frequency demand disconnection functional capabilities shall allow for disconnecting demand in stages for a range of operational frequencies;

(c) the low frequency demand disconnection functional capabilities shall allow for operation from a nominal Alternating Current ('AC') input to be specified by the relevant system operator, and shall meet the following requirements:

(i) frequency range: at least between 47-50 Hz, adjustable in steps of 0,05 Hz;

(ii) operating time: no more than 150 ms after triggering the frequency set point **and no more than 450 ms after triggering the frequency set point in Georgia**;

(iii) voltage lock-out: blocking of the functional capability shall be possible when the voltage is within a range of 30 to 90% of reference 1 pu voltage;

(iv) provide the direction of active power flow at the point of disconnection;

(d) the AC voltage supply used in providing low frequency demand disconnection functional capabilities, shall be provided from the network at the frequency signal measuring point, as used in providing functional capabilities in accordance with paragraph 1(c), so that the frequency of the low frequency demand disconnection functional capabilities supply voltage is the same as the one of the network.

2. With regard to low voltage demand disconnection functional capabilities, the following requirements shall apply:

(a) the relevant TSO may specify, in coordination with the transmission-connected distribution system operators, low voltage demand disconnection functional capabilities for the transmission-connected distribution facilities;

(b) the relevant TSO may specify, in coordination with the transmission-connected demand facility owners, low voltage demand disconnection functional capabilities for the transmission-connected demand facilities;

(c) based on the TSO's assessment concerning system security, the implementation of on load tap changer blocking and low voltage demand disconnection shall be binding for the transmission-connected distribution system operators;

(d) if the relevant TSO decides to implement a low voltage demand disconnection functional capability, the equipment for both on load tap changer blocking and low voltage demand disconnection shall be installed in coordination with the relevant TSO;

(e) the method for low voltage demand disconnection shall be implemented by relay or control room initiation;

(f) the low voltage demand disconnection functional capabilities shall have the following features:

(i) the low voltage demand disconnection functional capability shall monitor the voltage by measuring all three phases;

(ii) blocking of the relays' operation shall be based on direction of either active power or reactive power flow.

3. With regard to blocking of on load tap changers, the following requirements shall apply:

(a) if required by the relevant TSO, the transformer at the transmission-connected distribution facility shall be capable of automatic or manual on load tap changer blocking;

(b) the relevant TSO shall specify the automatic on load tap changer blocking functional capability.

4. All transmission-connected demand facilities and transmission-connected distribution systems shall fulfil the following requirements related to disconnection or reconnection of a transmission-connected demand facility or a transmission-connected distribution system:

(a) with regard to the capability of reconnection after a disconnection, the relevant TSO shall specify the conditions under which a transmission-connected demand facility or a transmission-connected distribution system is entitled to reconnect to the transmission system. Installation of automatic reconnection systems shall be subject to prior authorisation by the relevant TSO;

(b) with regard to reconnection of a transmission-connected demand facility or a transmission-connected distribution system, the transmission-connected demand facility or the transmission-connected distribution system shall be capable of synchronisation for frequencies within the ranges set out in Article 12. The relevant TSO and the transmission-connected demand facility owner or the transmission-connected distribution system operator shall agree on the settings of synchronisation devices prior to connection of the transmission-connected demand facility or the transmission-connected distribution system, including voltage, frequency, phase angle range and deviation of voltage and frequency;

(c) a transmission-connected demand facility or a transmission-connected distribution facility shall be capable of being remotely disconnected from the transmission system when required by the relevant TSO. If required, the automated disconnection equipment for reconfiguration of the system in preparation for block loading shall be specified by the relevant TSO. The relevant TSO shall specify the time required for remote disconnection.

## **Article 20**

### **Power quality**

Transmission-connected demand facility owners and transmission-connected distribution system operators shall ensure that their connection to the network does not result in a determined level of distortion or fluctuation of the supply voltage on the network, at the connection point. The level of

distortion shall not exceed that allocated to them by the relevant TSO. TSOs shall coordinate their power quality requirements with the requirements of adjacent TSOs.

### **Article 21**

#### **Simulation models**

1. Transmission-connected demand facilities and transmission-connected distribution systems shall fulfil the requirements set out in paragraphs 3 and 4 related to the simulation models or equivalent information.

2. Each TSO may require simulation models or equivalent information showing the behaviour of the transmission-connected demand facility, or the transmission-connected distribution system, or both, in steady and dynamic states.

3. Each TSO shall specify the content and format of those simulation models or equivalent information. The content and format shall include:

- (a) steady and dynamic states, including 50 Hz component;
- (b) electromagnetic transient simulations at the connection point;
- (c) structure and block diagrams.

4. For the purpose of dynamic simulations, the simulation model or equivalent information referred to in paragraph 3(a) shall contain the following sub-models or equivalent information:

- (a) power control;
- (b) voltage control;
- (c) transmission-connected demand facility and transmission-connected distribution system protection models;
- (d) the different types of demand, that is to say electro technical characteristics of the demand; and
- (e) converter models.

5. Each relevant system operator or relevant TSO shall specify the requirements of the performance of the recordings of transmission-connected demand facilities or transmission-connected distribution facilities, or both, in order to compare the response of the model with these recordings.

## **CHAPTER 2**

### **Operational notification procedure**

#### **Article 22**

##### **General provisions**

1. The operational notification procedure for the connection of each new transmission-connected demand facility, each new transmission-connected distribution facility and each new transmission-connected distribution system, shall comprise:

- (a) an energisation operational notification (EON);
- (b) an interim operational notification (ION);
- (c) a final operational notification (FON).

2. Each transmission-connected demand facility owner or transmission-connected distribution system operator to which one or more of the requirements in Title II apply shall demonstrate to the relevant TSO that it has complied with the requirements set out in Title II of this Regulation by completing successfully the operational notification procedure for connection of each transmission-connected demand facility, each transmission-connected distribution facility and each transmission-connected distribution system described in Articles 23 to 26.

3. The relevant TSO shall specify and make publicly available further details concerning the operational notification procedure.

### **Article 23**

#### **Energisation operational notification**

1. An EON shall entitle the transmission-connected demand facility owner or transmission-connected distribution system operator to energise its internal network and auxiliaries by using the grid connection that is specified for the connection point.

2. An EON shall be issued by the relevant TSO, subject to completion of preparations including agreement on the protection and control settings relevant to the connection point between the relevant TSO and the transmission-connected demand facility owner or transmission-connected distribution system operator.

### **Article 24**

#### **Interim operational notification**

1. An ION shall entitle the transmission-connected demand facility owner or transmission-connected distribution system operator to operate the transmission-connected demand facility, the transmission-connected distribution facility, or the transmission-connected distribution system by using the grid connection for a limited period of time.

2. An ION shall be issued by the relevant TSO, subject to completion of the data and study review process as required by this Article.

3. With regard to the data and study review, the relevant TSO shall have the right to request that the transmission-connected demand facility owner or transmission-connected distribution system operator provide the following:

- (a) an itemised statement of compliance;
- (b) detailed technical data of the transmission-connected demand facility, the transmission-connected distribution facility or the transmission-connected distribution system relevant to the grid connection as specified by the relevant TSO;

(c) equipment certificates issued by an authorised certifier in respect of transmission-connected demand facilities, transmission-connected distribution facilities and transmission-connected distribution systems, where these are relied upon as part of the evidence of compliance;

(d) simulation models, as specified in Article 21 and required by the TSO;

(e) studies demonstrating expected steady-state and dynamic performance as required in Articles 43, 46 and 47;

(f) details of intended practical method of completing compliance tests according to Chapter 2 of Title IV.

4. The maximum period during which the transmission-connected demand facility owner or transmission-connected distribution system operator may maintain ION status shall be 24 months. The relevant TSO is entitled to specify a shorter ION validity period. An extension of the ION shall be granted only if the transmission-connected demand facility owner or transmission-connected distribution system operator has made substantial progress towards full compliance. Outstanding issues shall be clearly identified at the time of requesting extension.

5. An extension of the period during which the transmission-connected demand facility owner or transmission-connected distribution system operator may maintain ION status, beyond the period established in paragraph 4, may be granted if a request for a derogation is made to the relevant TSO before the expiry of that period in accordance with the derogation procedure laid down in Article 50.

## **Article 25**

### **Final operational notification**

1. A FON shall entitle the transmission-connected demand facility owner or transmission-connected distribution system operator to operate the transmission-connected demand facility, the transmission-connected distribution facility or the transmission-connected distribution system by using the grid connection.

2. A FON shall be issued by the relevant TSO, upon prior removal of all incompatibilities identified for the purposes of the ION status and subject to the completion of the data and study review process as required by this Article.

3. For the purposes of the data and study review, the transmission-connected demand facility owner or transmission-connected distribution system operator must submit the following to the relevant TSO:

(a) an itemised statement of compliance; and

(b) an update of the applicable technical data, simulation models and studies as referred to in points (b), (d) and (e) of Article 24(3), including the use of actual measured values during testing.

4. If incompatibility is identified in connection with the issuing of the FON, a derogation may be granted upon a request made to the relevant TSO, in accordance with the derogation procedure described in Chapter 2 of Title V. A FON shall be issued by the relevant TSO if the transmission-connected demand facility, the transmission-connected distribution facility, or the transmission-connected distribution system complies with the provisions of the derogation.

Where a request for a derogation is rejected, the relevant TSO shall have the right to refuse to allow

the operation of the transmission-connected demand facility, the transmission-connected distribution facility, or the transmission-connected distribution system until the transmission-connected demand facility owner or transmission-connected distribution system operator and the relevant TSO resolve the incompatibility and the relevant TSO considers that the transmission-connected demand facility, the transmission-connected distribution facility, or the transmission-connected distribution system complies with the provisions of this Regulation.

If the relevant TSO and the transmission-connected demand facility owner or transmission-connected distribution system operator do not resolve the incompatibility within a reasonable time frame, but in any case not later than six months after the notification of the rejection of the request for a derogation, each party may refer the issue for decision to the regulatory authority.

### **Article 26**

#### **Limited operational notification**

1. Transmission-connected demand facility owners or transmission-connected distribution system operators to whom a FON has been granted, shall inform the relevant TSO, no later than 24 hours after the incident has occurred, of the following circumstances:

- (a) the facility is temporarily subject to either significant modification or loss of capability affecting its performance; or
- (b) equipment failure leading to non-compliance with some relevant requirements.

A longer time period to inform the relevant TSO can be agreed with the transmission-connected demand facility owner or transmission-connected distribution system operator depending on the nature of the changes.

2. The transmission-connected demand facility owner or transmission-connected distribution system operator shall apply to the relevant TSO for a limited operational notification (LON), if the transmission-connected demand facility owner or transmission-connected distribution system operator expects the circumstances described in paragraph 1 to persist for more than three months.

3. A LON shall be issued by the relevant TSO and shall contain the following information which shall be clearly identifiable:

- (a) the unresolved issues justifying the granting of the LON;
- (b) the responsibilities and timescales for expected solution; and
- (c) a maximum period of validity which shall not exceed 12 months. The initial period granted may be shorter with the possibility of an extension if evidence is submitted to the satisfaction of the relevant TSO demonstrating that substantial progress has been made towards achieving full compliance.

4. The FON shall be suspended during the period of validity of the LON with regard to the items for which the LON has been issued.

5. A further extension of the period of validity of the LON may be granted upon a request for a derogation made to the relevant TSO before the expiry of that period, in accordance with the derogation procedure described in Chapter 2 of Title V.

6. The relevant TSO shall have the right to refuse to allow the operation of the transmission-connected

demand facility, the transmission-connected distribution facility, or the transmission-connected distribution system once the LON is no longer valid. In such cases, the FON shall automatically become invalid.

7. If the relevant TSO does not grant an extension of the period of validity of the LON in accordance with paragraph 5 or if it refuses to allow the operation of the transmission-connected demand facility, the transmission-connected distribution facility, or the transmission-connected distribution system once the LON is no longer valid in accordance with paragraph 6, the transmission-connected demand facility owner or transmission-connected distribution system operator may refer the issue for decision to the regulatory authority within six months after the notification of the decision of the relevant TSO.

### TITLE III

## CONNECTION OF DEMAND UNITS USED BY A DEMAND FACILITY OR A CLOSED DISTRIBUTION SYSTEM TO PROVIDE DEMAND RESPONSE SERVICES TO SYSTEM OPERATORS

### CHAPTER 1

#### General requirements

#### *Article 27*

#### General provisions

1. Demand response services provided to system operators shall be distinguished based on the following categories:

(a) remotely controlled:

- (i) demand response active power control;
- (ii) demand response reactive power control;
- (iii) demand response transmission constraint management.

(b) autonomously controlled:

- (i) demand response system frequency control;
  - (ii) demand response very fast active power control.
2. Demand facilities and closed distribution systems may provide demand response services to relevant system operators and relevant TSOs. Demand response services can include, jointly or separately, upward or downward modification of demand.

3. The categories referred to in paragraph 1 are not exclusive and this Regulation does not prevent other categories from being developed. This Regulation does not apply to demand response services provided to other entities than relevant system operators or relevant TSOs.

### **Article 28**

#### **Specific provisions for demand units with demand response active power control, reactive power control and transmission constraint management**

1. Demand facilities and closed distribution systems may offer demand response active power control, demand response reactive power control, or demand response transmission constraint management to relevant system operators and relevant TSOs.

2. Demand units with demand response active power control, demand response reactive power control, or demand response transmission constraint management shall comply with the following requirements, either individually or, where it is not part of a transmission-connected demand facility, collectively as part of demand aggregation through a third party:

(a) be capable of operating across the frequency ranges specified in Article 12(1) and the extended range specified in Article 12(2);

(b) be capable of operating across the voltage ranges specified in Article 13 if connected at a voltage level at or above 110 kV;

(c) be capable of operating across the normal operational voltage range of the system at the connection point, specified by the relevant system operator, if connected at a voltage level below 110 kV. This range shall take into account existing standards and shall, prior to approval in accordance with Article 6, be subject to consultation with the relevant stakeholders in accordance with Article 9(1);

(d) be capable of controlling power consumption from the network in a range equal to the range contracted, directly or indirectly through a third party, by the relevant TSO;

(e) be equipped to receive instructions, directly or indirectly through a third party, from the relevant system operator or the relevant TSO to modify their demand and to transfer the necessary information. The relevant system operator shall make publicly available the technical specifications approved to enable this transfer of information. For demand units connected at a voltage level below 110 kV, these specifications shall, prior to approval in accordance with Article 6, be subject to consultation with the relevant stakeholders in accordance with Article 9(1);

(f) be capable of adjusting its power consumption within a time period specified by the relevant system operator or the relevant TSO. For demand units connected at a voltage level below 110 kV, these specifications shall, prior to approval in accordance with Article 6, be subject to consultation with the relevant stakeholders in accordance with Article 9(1);

(g) be capable of full execution of an instruction issued by the relevant system operator or the relevant TSO to modify its power consumption to the limits of the electrical protection safeguards, unless a contractually agreed method is in place with the relevant system operator or relevant TSO for the replacement of their contribution (including aggregated demand facilities' contribution through a third party);

(h) once a modification to power consumption has taken place and for the duration of the requested modification, only modify the demand used to provide the service if required by the relevant system operator or relevant TSO to the limits of the electrical protection safeguards, unless a contractually agreed method is in place with the relevant system operator or relevant TSO for the replacement of their contribution (including aggregated demand facilities' contribution through a third party).

Instructions to modify power consumption may have immediate or delayed effects;

- (i) notify the relevant system operator or relevant TSO of the modification of demand response capacity. The relevant system operator or relevant TSO shall specify the modalities of the notification;
- (j) where the relevant system operator or the relevant TSO, directly or indirectly through a third party, command the modification of the power consumption, enable the modification of a part of its demand in response to an instruction by the relevant system operator or the relevant TSO, within the limits agreed with the demand facility owner or the CDSO and according to the demand unit settings;
- (k) have the withstand capability to not disconnect from the system due to the rate-of-change-of-frequency up to a value specified by the relevant TSO. With regard to this withstand capability, the value of rate-of-change-of-frequency shall be calculated over a 500 ms time frame. For demand units connected at a voltage level below 110 kV, these specifications shall, prior to approval in accordance with Article 6, be subject to consultation with the relevant stakeholders in accordance with Article 9(1);
- (l) where modification to the power consumption is specified via frequency or voltage control, or both, and via pre-alert signal sent by the relevant system operator or the relevant TSO, be equipped to receive, directly or indirectly through a third party, the instructions from the relevant system operator or the relevant TSO, to measure the frequency or voltage value, or both, to command the demand trip and to transfer the information. The relevant system operator shall specify and publish the technical specifications approved to enable this transfer of information. For demand units connected at a voltage level below 110 kV, these specifications shall, prior to approval in accordance with Article 6, be subject to consultation with the relevant stakeholders in accordance with Article 9(1).

3. For voltage control with disconnection or reconnection of static compensation facilities, each transmission-connected demand facility or transmission-connected closed distribution system shall be able to connect or disconnect its static compensation facilities, directly or indirectly, either individually or commonly as part of demand aggregation through a third party, in response to an instruction transmitted by the relevant TSO, or in the conditions set forth in the contract between the relevant TSO and the demand facility owner or the CDSO.

## **Article 29**

### **Specific provisions for demand units with demand response system frequency control**

1. Demand facilities and closed distribution systems may offer demand response system frequency control to relevant system operators and relevant TSOs.

2. Demand units with demand response system frequency control shall comply with the following requirements, either individually or, where it is not part of a transmission-connected demand facility, collectively as part of demand aggregation through a third party:

- (a) be capable of operating across the frequency ranges specified in Article 12(1) and the extended range specified in Article 12(2);
- (b) be capable of operating across the voltage ranges specified in Article 13 if connected at a voltage level at or above 110 kV;
- (c) be capable of operating across the normal operational voltage range of the system at the connec-

tion point, specified by the relevant system operator, if connected at a voltage level below 110 kV. This range shall take into account existing standards, and shall, prior to approval in accordance with Article 6, be subject to consultation with the relevant stakeholders in accordance with Article 9(1);

(d) be equipped with a control system that is insensitive within a dead band around the nominal system frequency of 50,00 Hz, of a width to be specified by the relevant TSO in consultation with the TSOs in the synchronous area. For demand units connected at a voltage level below 110 kV, these specifications shall, prior to approval in accordance with Article 6, be subject to consultation with the relevant stakeholders in accordance with Article 9(1);

(e) be capable of, upon return to frequency within the dead band specified in paragraph 2(d), initiating a random time delay of up to 5 minutes before resuming normal operation.

The maximum frequency deviation from nominal value of 50,00 Hz to respond to shall be specified by the relevant TSO in coordination with the TSOs in the synchronous area. For demand units connected at a voltage level below 110 kV, these specifications shall, prior to approval in accordance with Article 6, be subject to consultation with the relevant stakeholders in accordance with Article 9(1).

The demand shall be increased or decreased for a system frequency above or below the dead band of nominal (50,00 Hz) respectively;

(f) be equipped with a controller that measures the actual system frequency. Measurements shall be updated at least every 0,2 seconds;

(g) be able to detect a change in system frequency of 0,01 Hz, in order to give overall linear proportional system response, with regard to the demand response system frequency control's sensitivity and accuracy of the frequency measurement and the consequent modification of the demand. The demand unit shall be capable of a rapid detection and response to changes in system frequency, to be specified by the relevant TSO in coordination with the TSOs in the synchronous area. An offset in the steady-state measurement of frequency shall be acceptable up to 0,05 Hz.

### **Article 30**

#### **Specific provisions for demand units with demand response very fast active power control**

1. The relevant TSO in coordination with the relevant system operator may agree with a demand facility owner or a CDSO (including, but not restricted to, through a third party) on a contract for the delivery of demand response very fast active power control.

2. If the agreement referred to in paragraph 1 takes place, the contract referred to in paragraph 1 shall specify:

(a) a change of active power related to a measure such as the rate-of-change-of-frequency for that portion of its demand;

(b) the operating principle of this control system and the associated performance parameters;

(c) the response time for very fast active power control, which shall not be longer than 2 seconds.

## CHAPTER 2

### Operational notification procedure

#### *Article 31*

##### **General provisions**

1. The operational notification procedure for demand units used by a demand facility or a closed distribution system to provide demand response to system operators shall be distinguished between:
  - (a) demand units within a demand facility or a closed distribution system connected at a voltage level of or below 1 000 V;
  - (b) demand units within a demand facility or a closed distribution system connected at a voltage level above 1 000 V.
2. Each demand facility owner or CDSO, providing demand response to a relevant system operator or a relevant TSO, shall confirm to the relevant system operator, or relevant TSO, directly or indirectly through a third party, its ability to satisfy the technical design and operational requirements as referred to in Chapter 1 of Title III of this Regulation.
3. The demand facility owner or the CDSO shall notify, directly or indirectly, through a third party, the relevant system operator or relevant TSO, in advance of any decision to cease offering demand response services and/or about the permanent removal of the demand unit with demand response. This information may be aggregated as specified by the relevant system operator or relevant TSO.
4. The relevant system operator shall specify and make publicly available further details concerning the operational notification procedure.

#### *Article 32*

##### **Procedures for demand units within a demand facility or a closed distribution system connected at a voltage level of or below 1 000 V**

1. The operational notification procedure for a demand unit within a demand facility or a closed distribution system connected at a voltage level of or below 1 000 V shall comprise an installation document.
2. The installation document template shall be provided by the relevant system operator, and the contents agreed with the relevant TSO, either directly or indirectly through a third party.
3. Based on an installation document, the demand facility owner or the CDSO shall submit information, directly or indirectly through a third party, to the relevant system operator or relevant TSO. The date of this submission shall be prior to the offer in the market of the capacity of the demand response by the demand unit. The requirements set in the installation document shall differentiate between different types of connections and between the different categories of demand response services.
4. For subsequent demand units with demand response, separate installation documents shall be provided.

5. The content of the installation document of individual demand units may be aggregated by the relevant system operator or relevant TSO.

6. The installation document shall contain the following items:

- (a) the location at which the demand unit with demand response is connected to the network;
- (b) the maximum capacity of the demand response installation in kW;
- (c) the type of demand response services;
- (d) the demand unit certificate and the equipment certificate as relevant for the demand response service, or if not available, equivalent information;
- (e) the contact details of the demand facility owner, the closed distribution system operator or the third party aggregating the demand units from the demand facility or the closed distribution system.

### **Article 33**

#### **Procedures for demand units within a demand facility or a closed distribution system connected at a voltage level above 1 000 V**

1. The operational notification procedure for a demand unit within a demand facility or a closed distribution system connected at a voltage level above 1 000 V shall comprise a DRUD. The relevant system operator, in coordination with the relevant TSO, shall specify the content required for the DRUD. The content of the DRUD shall require a statement of compliance which contains the information in Articles 36 to 47 for demand facilities and closed distribution systems, but the compliance requirements in Articles 36 to 47 for demand facilities and closed distribution systems can be simplified to a single operational notification stage as well as be reduced. The demand facility owner or CDSO shall provide the information required and submit it to the relevant system operator. Subsequent demand units with demand response shall provide separate DRUDs.

2. Based on the DRUD, the relevant system operator shall issue a FON to the demand facility owner or CDSO.

## **TITLE IV COMPLIANCE**

### **CHAPTER 1 General provisions**

#### **Article 34**

#### **Responsibility of the demand facility owner, the distribution system operator and the closed distribution system operator**

1. Transmission-connected demand facility owners and DSOs shall ensure that their transmission-connected demand facilities, transmission-connected distribution facilities, or distribution systems comply with the requirements provided for in this Regulation. A demand facility owner or a CDSO providing demand response services to relevant system operators and relevant TSOs shall ensure that the demand

unit complies with the requirements provided for in this Regulation.

2. Where the requirements of this Regulation are applicable to demand units used by a demand facility or a closed distribution system to provide demand response services to relevant system operators and relevant TSOs, the demand facility owner or the CDSO may totally or partially delegate to third parties tasks such as communicating with the relevant system operator or relevant TSO and gathering the documentation from the demand facility owner, the DSO or the CDSO evidencing compliance.

Third parties shall be treated as single users with the right to compile relevant documentation and demonstrate compliance of their aggregated demand facilities or aggregated closed distribution systems with the provisions of this Regulation. Demand facilities and closed distribution systems providing demand response services to relevant system operators and relevant TSOs may act collectively through third parties.

3. Where obligations are fulfilled through third parties, third parties shall only be required to inform the relevant system operator of changes to the total services being offered, taking account of location specific services.

4. Where the requirements are specified by the relevant TSO, or are for the purpose of the operation of the relevant TSO's system, alternative tests or requirements for test result acceptance for these requirements may be agreed with the relevant TSO.

5. Any intention to modify the technical capabilities of the transmission-connected demand facility, the transmission-connected distribution facility, the distribution system, or the demand unit, which has impact on compliance with the requirements provided for in Chapters 2 to 4 of Title IV, shall be notified to the relevant system operator, directly or indirectly through a third party, prior to pursuing such modification, within the time frame provided by the relevant system operator.

6. Any operational incidents or failures of the transmission-connected demand facility, the transmission-connected distribution facility, the distribution system or the demand unit, which have an impact on compliance with the requirements provided for in Chapters 2 to 4 of Title IV, shall be notified to the relevant system operator, directly or indirectly through a third party, as soon as possible after the occurrence of such an incident.

7. Any planned test schedules and procedures to verify compliance of the transmission-connected demand facility, the transmission-connected distribution facility, the distribution system, or the demand unit, with the requirements of this Regulation, shall be notified to the relevant system operator within the time frame specified by the relevant system operator and approved by the relevant system operator prior to their commencement.

8. The relevant system operator may participate in such tests and may record the performance of the transmission-connected demand facility, the transmission-connected distribution facility, the distribution system, and the demand unit.

### **Article 35**

#### **Tasks of the relevant system operator**

1. The relevant system operator shall assess the compliance of a transmission-connected demand facility, a transmission-connected distribution facility, a distribution system, or a demand unit, with

the requirements of this Regulation throughout the lifetime of the transmission-connected demand facility, the transmission-connected distribution facility, the distribution system, or the demand unit. The demand facility owner, the DSO or the CDSO shall be informed of the outcome of this assessment.

The compliance of a demand unit used by a demand facility or a closed distribution system to provide demand response services to relevant TSOs, shall be jointly assessed by the relevant TSO and the relevant system operator, and if applicable in coordination with the third party involved in demand aggregation.

2. The relevant system operator shall have the right to request that the demand facility owner, the DSO or the CDSO carries out compliance tests and simulations according to a repeat plan or general scheme or after any failure, modification or replacement of any equipment that may have an impact on the compliance of the transmission-connected demand facility, the transmission-connected distribution facility, the distribution system, or the demand unit with the requirements of this Regulation. The demand facility owner, the DSO or the CDSO shall be informed of the outcome of those compliance tests and simulations.

3. The relevant system operator shall make publicly available the list of information and documents to be provided as well as the requirements to be fulfilled by the demand facility owner, the DSO or the CDSO in the frame of the compliance process. The list shall cover at least the following information, documents and requirements:

- (a) all documentation and certificates to be provided by the demand facility owner, the DSO or the CDSO;
- (b) details of the technical data required from the transmission-connected demand facility, the transmission-connected distribution facility, the distribution system, or the demand unit, with relevance to the grid connection or operation;
- (c) requirements for models for steady-state and dynamic system studies;
- (d) timeline for the provision of system data required to perform the studies;
- (e) studies by the demand facility owner, the DSO or the CDSO for demonstrating expected steady-state and dynamic performance referring to the requirements set forth in Articles 43, 44 and 45;
- (f) conditions and procedures including scope for registering equipment certificates;
- (g) conditions and procedures for the use of relevant equipment certificates issued by an authorised certifier by the demand facility owner, the DSO or the CDSO.

4. The relevant system operator shall make public the allocation of responsibilities to the demand facility owner, the DSO or the CDSO and to the system operator for compliance testing, simulation and monitoring.

5. The relevant system operator may totally or partially delegate the performance of its compliance monitoring to third parties. In such cases, the relevant system operator shall continue ensuring compliance with Article 11, including entering into confidentiality commitments with the assignee.

6. If compliance tests or simulations cannot be carried out as agreed between the relevant system operator and the demand facility owner, the DSO or the CDSO due to reasons attributable to the relevant system operator, then the relevant system operator shall not unreasonably withhold the operational notification referred to in Title II and Title III.

## CHAPTER 2

### Compliance testing

#### *Article 36*

#### **Common provisions for compliance testing**

1. Testing of the performance of a transmission-connected demand facility, a transmission-connected distribution facility, or a demand unit with demand response active power control, demand response reactive power control or demand response transmission constraint management, shall aim at demonstrating that the requirements of this Regulation have been complied with.
2. Notwithstanding the minimum requirements for compliance testing set out in this Regulation, the relevant system operator is entitled to:
  - (a) allow the demand facility owner, the DSO or the CDSO to carry out an alternative set of tests, provided that those tests are efficient and suffice to demonstrate that a demand facility or a distribution system complies with the requirements of this Regulation; and
  - (b) require the demand facility owner, the DSO or the CDSO to carry out additional or alternative sets of tests in those cases where the information supplied to the relevant system operator in relation to compliance testing under the provisions of Articles 37 to 41, is not sufficient to demonstrate compliance with the requirements of this Regulation.
3. The demand facility owner, the DSO or the CDSO is responsible for carrying out the tests in accordance with the conditions laid down in Chapter 2 of Title IV. The relevant system operator shall cooperate and not unduly delay the performance of the tests.
4. The relevant system operator may participate in the compliance testing either on site or remotely from the system operator's control room. For that purpose, the demand facility owner, the DSO or the CDSO shall provide the monitoring equipment necessary to record all relevant test signals and measurements as well as ensure that the necessary representatives of the demand facility owner, the DSO or the CDSO are available on site for the entire testing period. Signals specified by the relevant system operator shall be provided if, for selected tests, the system operator wishes to use its own equipment to record performance. The relevant system operator has sole discretion to decide about its participation.

#### *Article 37*

#### **Compliance testing for disconnection and reconnection of transmission-connected distribution facilities**

1. The transmission-connected distribution facilities shall comply with the requirements for disconnection and reconnection referred in Article 19 and shall be subject to the following compliance tests.
2. With regard to testing of the capability of reconnection after an incidental disconnection due to a network disturbance, reconnection shall be achieved through a reconnection procedure, preferably by automation, authorised by the relevant TSO.

3. With regard to the synchronisation test, the technical synchronisation capabilities of the transmission-connected distribution facility shall be demonstrated. This test shall verify the settings of the synchronisation devices. This test shall cover the following matters: voltage, frequency, phase angle range, deviation of voltage and frequency.
4. With regard to the remote disconnection test, the transmission-connected distribution facility's technical capability for remote disconnection at the connection point or points from the transmission system when required by the relevant TSO and within the time specified by the relevant TSO shall be demonstrated.
5. With regard to the low frequency demand disconnection test, the transmission-connected distribution facility's technical capability of low frequency demand disconnection of a percentage of demand to be specified by the relevant TSO, in coordination with adjacent TSOs, where equipped as provided for in Article 19, shall be demonstrated.
6. With regard to the low frequency demand disconnection relays test, the transmission-connected distribution facility's technical capability to operate from a nominal AC supply input shall be demonstrated in accordance with Article 19(1) and (2). This AC supply input shall be specified by the relevant TSO.
7. With regard to the low voltage demand disconnection test, the transmission-connected distribution facility's technical capability to operate in a single action with on load tap changer blocking in Article 19(3) shall be demonstrated in accordance with Article 19(2).
8. An equipment certificate may be used instead of part of the tests provided for in paragraph 1, on the condition that it is provided to the relevant TSO.

#### **Article 38**

##### **Compliance testing for information exchange of transmission-connected distribution facilities**

1. With regard to information exchange between the relevant TSO and the transmission-connected distribution system operator in real time or periodically, the transmission-connected distribution facility's technical capability to comply with the information exchange standard established pursuant to Article 18(3) shall be demonstrated.
2. An equipment certificate may be used instead of part of the tests provided for in paragraph 1, on the condition that it is provided to the relevant TSO.

#### **Article 39**

##### **Compliance testing for disconnection and reconnection of transmission-connected demand facilities**

1. The transmission-connected demand facilities shall comply with the requirements for disconnection and reconnection referred to in Article 19 and shall be subject to the following compliance tests.
2. With regard to testing of the capability of reconnection after an incidental disconnection due to a network disturbance, reconnection shall be achieved through a reconnection procedure, preferably

by automation, authorised by the relevant TSO.

3. With regard to the synchronisation test, the technical synchronisation capabilities of the transmission-connected demand facility shall be demonstrated. This test shall verify the settings of the synchronisation devices. This test shall cover the following matters: voltage, frequency, phase angle range, deviation of voltage and frequency.

4. With regard to the remote disconnection test, the transmission-connected demand facility's technical capability for remote disconnection at the connection point or points from the transmission system when required by the relevant TSO and within the time specified by the relevant TSO shall be demonstrated.

5. With regard to the low frequency demand disconnection relays test, the transmission-connected demand facility's technical capability to operate from a nominal AC input shall be demonstrated in accordance with Article 19(1) and (2). This AC supply input shall be specified by the relevant TSO.

6. With regard to the low voltage demand disconnection test, the transmission-connected demand facility's technical capability to operate in a single action with on load tap changer blocking in Article 19(3) shall be demonstrated in accordance with Article 19(2).

7. An equipment certificate may be used instead of part of the tests provided for in paragraph 1, on the condition that it is provided to the relevant TSO.

#### **Article 40**

##### **Compliance testing for information exchange of transmission-connected demand facilities**

1. With regard to information exchange between the relevant TSO and the transmission-connected demand facility owner in real time or periodically, the transmission-connected demand facility's technical capability to comply with the information exchange standard established pursuant to Article 18(3) shall be demonstrated.

2. An equipment certificate may be used instead of part of the tests provided for in paragraph 1, on the condition that it is provided to the relevant TSO.

#### **Article 41**

##### **Compliance testing for demand units with demand response active power control, reactive power control and transmission constraint management**

1. With regard to the demand modification test:

(a) the technical capability of the demand unit used by a demand facility or a closed distribution system to provide demand response active power control, demand response reactive power control or demand response transmission constraint management to modify its power consumption, after receiving an instruction from the relevant system operator or relevant TSO, within the range, duration and time frame previously agreed and established in accordance with Article 28, shall be demonstrated, either individually or collectively as part of demand aggregation through a third party;

(b) the test shall be carried out either by an instruction or alternatively by simulating the receipt of an instruction from the relevant system operator or relevant TSO and adjusting the power demand of the demand facility or the closed distribution system;

(c) the test shall be deemed passed, provided that the conditions specified by the relevant system operator or relevant TSO pursuant to Article 28(2)(d)(f)(g)(h)(k) and (l) are fulfilled;

(d) an equipment certificate may be used instead of part of the tests provided for in paragraph 1(b), on the condition that it is provided to the relevant system operator or relevant TSO.

2. With regard to the disconnection or reconnection of static compensation facilities test:

(a) the technical capability of the demand unit used by a demand facility owner or closed distribution system operator to provide demand response active power control, demand response reactive power control or demand response transmission constraint management to disconnect or reconnect, or both, its static compensation facility when receiving an instruction from the relevant system operator or relevant TSO, in the time frame expected in accordance with Article 28, shall be demonstrated, either individually or collectively as part of demand aggregation through a third party;

(b) the test shall be carried out by simulating the receipt of an instruction from the relevant system operator or relevant TSO and subsequently disconnecting the static compensation facility, and by simulating the receipt of an instruction from the relevant system operator or relevant TSO and subsequently reconnecting the facility;

(c) the test shall be deemed passed, provided that the conditions specified by the relevant system operator or relevant TSO pursuant to Article 28(2)(d)(f)(g)(h)(k) and (l) are fulfilled.

## **CHAPTER 3**

### **Compliance simulation**

#### ***Article 42***

#### **Common provisions on compliance simulations**

1. Simulation of the performance of a transmission-connected demand facility, a transmission-connected distribution facility, or a demand unit with demand response very fast active power control within a demand facility or a closed distribution system shall result in demonstrating whether the requirements of this Regulation have been fulfilled or not.

2. Simulations shall be run in the following circumstances:

(a) a new connection to the transmission system is required;

(b) a new demand unit used by a demand facility or a closed distribution system to provide demand response very fast active power control to a relevant TSO has been contracted in accordance with Article 30;

(c) a further development, replacement or modernisation of equipment takes place;

(d) alleged non-compliance by the relevant system operator with the requirements of this Regulation.

3. Notwithstanding the minimum requirements for compliance simulation set out in this Regulation,

the relevant system operator is entitled to:

(a) allow the demand facility owner, the DSO or the CDSO to carry out an alternative set of simulations, provided that those simulations are efficient and suffice to demonstrate that a demand facility or a distribution system complies with the requirements of this Regulation or with national legislation; and  
 (b) require the demand facility owner, the DSO or the CDSO to carry out additional or alternative sets of simulations in those cases where the information supplied to the relevant system operator in relation to compliance simulation under the provisions of Articles 43, 44 and 45, is not sufficient to demonstrate compliance with the requirements of this Regulation.

4. The transmission-connected demand facility owner or the transmission-connected distribution system operator shall provide a report with the simulation results for each individual transmission-connected demand facility or transmission-connected distribution facility. The transmission-connected demand facility owner or the transmission-connected distribution system operator shall produce and provide a validated simulation model for a given transmission-connected demand facility or transmission-connected distribution facility. The scope of the simulation models is set out in Article 21(1) and (2).

5. The relevant system operator shall have the right to check that a demand facility or a distribution system complies with the requirements of this Regulation by carrying out its own compliance simulations based on the provided simulation reports, simulation models and compliance test measurements.

6. The relevant system operator shall provide the demand facility owner, the DSO or the CDSO with technical data and a simulation model of the network, to the extent necessary to carry out the requested simulations in accordance with Articles 43, 44 and 45.

### **Article 43**

#### **Compliance simulations for transmission-connected distribution facilities**

1. With regard to the reactive power capability simulation of a transmission-connected distribution facility:

(a) a steady-state load flow simulation model of the network of the transmission-connected distribution system shall be used in order to calculate the reactive power exchange under different load and generation conditions;

(b) a combination of steady-state minimum and maximum load and generation conditions resulting in the lowest and highest reactive power exchange shall be part of the simulations;

(c) calculating the reactive power export at an active power flow of less than 25 % of the maximum import capability at the connection point shall be part of the simulations in accordance with Article 15.

2. The relevant TSO may specify the method for compliance simulation of the active control of reactive power set out in Article 15(3).

3. The simulation shall be deemed passed if the results demonstrate compliance with the requirements set out in Article 15.

**Article 44****Compliance simulations for transmission-connected demand facilities**

1. With regard to the reactive power capability simulation of a transmission-connected demand facility without onsite generation:

(a) the transmission-connected demand facility without onsite generation's reactive power capability at the connection point shall be demonstrated;

(b) a load flow simulation model of the transmission-connected demand facility shall be used to calculate the reactive power exchange under different load conditions. Minimum and maximum load conditions resulting in the lowest and highest reactive power exchange at the connection point shall be part of the simulations;

(c) the simulation shall be deemed passed if the results demonstrate compliance with the requirements set out in Article 15(1) and (2).

2. With regard to the reactive power capability simulation of a transmission-connected demand facility with onsite generation:

(a) a load flow simulation model of the transmission-connected demand facility shall be used to calculate the reactive power exchange under different load conditions and under different generation conditions;

(b) a combination of minimum and maximum load and generation conditions resulting in the lowest and highest reactive power capability at the connection point shall be part of the simulations;

(c) the simulation shall be deemed passed if the results demonstrate compliance with the requirements set out in Article 15(1) and (2).

**Article 45****Compliance simulations for demand units with demand response very fast active power control**

1. The model of the demand unit used by a demand facility owner or a closed distribution system operator to provide demand response very fast active power control shall demonstrate the technical capability of the demand unit to provide very fast active power control to a low frequency event in the conditions set out in Article 30.

2. The simulation shall be deemed passed provided that the model demonstrates compliance with the conditions set out in Article 30.

## CHAPTER 4

### Compliance monitoring

#### *Article 46*

#### **Compliance monitoring for transmission-connected distribution facilities**

With regard to compliance monitoring of the reactive power requirements applicable to transmission-connected distribution facilities:

- (a) the transmission-connected distribution facility shall be equipped with necessary equipment to measure the active and reactive power, in accordance with Article 15; and
- (b) the relevant system operator shall specify the time frame for compliance monitoring.

#### *Article 47*

#### **Compliance monitoring for transmission-connected demand facilities**

With regard to compliance monitoring of the reactive power requirements applicable to transmission-connected demand facilities:

- (a) the transmission-connected demand facility shall be equipped with necessary equipment to measure the active and reactive power, in accordance with Article 15; and
- (b) the relevant system operator shall specify the time frame for compliance monitoring.

## TITLE V

### APPLICATIONS AND DEROGATIONS

#### CHAPTER 1

#### Cost-benefit analysis

#### *Article 48*

#### **Identification of costs and benefits of application of requirements to existing transmission-connected demand facilities, existing transmission-connected distribution facilities, existing distribution systems and existing demand units**

1. Prior to the application of any requirement set out in this Regulation to existing transmission-connected demand facilities, existing transmission-connected distribution facilities, existing distribution systems and existing demand units in accordance with Article 4(3), the relevant TSO shall undertake a qualitative comparison of costs and benefits related to the requirement under consideration. This comparison shall take into account available network-based or market-based alternatives. The relevant

TSO may only proceed to undertake a quantitative cost-benefit analysis in accordance with paragraphs 2 to 5, if the qualitative comparison indicates that the likely benefits exceed the likely costs. If, however, the cost is deemed high or the benefit is deemed low, then the relevant TSO shall not proceed further.

2. Following a preparatory stage undertaken in accordance with paragraph 1, the relevant TSO shall carry out a quantitative cost-benefit analysis of any requirement under consideration for application to existing transmission-connected demand facilities, existing transmission-connected distribution facilities, existing distribution systems and existing demand units that have demonstrated potential benefits as a result of the preparatory stage according to paragraph 1.

3. Within three months of concluding the cost-benefit analysis, the relevant TSO shall summarise the findings in a report which shall:

(a) include the cost-benefit analysis and a recommendation on how to proceed;

(b) include a proposal for a transitional period for applying the requirement to existing transmission-connected demand facilities, existing transmission-connected distribution facilities, existing distribution systems and existing demand units. That transitional period shall not be more than two years from the date of the decision of the regulatory authority or where applicable the **Contracting Party** on the requirement's applicability;

(c) be subject to public consultation in accordance with Article 9.

4. No later than six months after the end of the public consultation, the relevant TSO shall prepare a report explaining the outcome of the consultation and making a proposal on the applicability of the requirement under consideration to existing transmission-connected demand facilities, existing transmission-connected distribution facilities, existing distribution systems and existing demand units. The report and proposal shall be notified to the regulatory authority or, where applicable, the **Contracting Party**, and the demand facility owner, DSO, CDSO or, where applicable, third party shall be informed on its content.

5. The proposal made by the relevant TSO to the regulatory authority or, where applicable, the **Contracting Party** pursuant to paragraph 4 shall include the following:

(a) an operational notification procedure for demonstrating the implementation of the requirements by the existing transmission-connected demand facilities, existing transmission-connected distribution facilities, existing distribution systems and existing demand units used by a demand facility or a closed distribution system to provide demand response services to relevant system operators and relevant TSOs;

(b) a transitional period for implementing the requirements which shall take into account the classes of transmission-connected demand facilities, transmission-connected distribution facilities, distribution systems and demand units used by a demand facility or a closed distribution system to provide demand response services to relevant system operators and relevant TSOs and any underlying obstacles to the efficient implementation of the equipment modification/refitting.

## Article 49

### Principles of cost-benefit analysis

1. Demand facility owners, DSOs and CDSOs shall assist and contribute to the cost-benefit analysis undertaken according to Articles 48 and 53 and provide the necessary data as requested by the relevant system operator or relevant TSO within three months of receiving a request, unless agreed otherwise by the relevant TSO. For the preparation of a cost-benefit-analysis by a demand facility owner or prospective owner, or by a DSO/CDSO or prospective operator, assessing a potential derogation pursuant to Article 52, the relevant TSO and DSO shall assist and contribute to the cost-benefit analysis and provide the necessary data as requested by the demand facility owner or prospective owner, or by the DSO/CDSO or prospective operator, within three months of receiving a request, unless agreed otherwise by the demand facility owner or prospective owner, or by the DSO/CDSO or prospective operator.

2. A cost-benefit analysis shall be in line with the following principles:

(a) the relevant TSO, demand facility owner or prospective owner, DSO/CDSO or prospective operator, shall base its cost-benefit analysis on one or more of the following calculating principles:

- (i) the net present value;
- (ii) the return on investment;
- (iii) the rate of return;
- (iv) the time needed to break even;

(b) the relevant TSO, demand facility owner or prospective owner, DSO/CDSO or prospective operator, shall also quantify socioeconomic benefits in terms of improvement in security of supply and shall include at least:

- (i) the associated reduction in probability of loss of supply over the lifetime of the modification;
- (ii) the probable extent and duration of such loss of supply;
- (iii) the societal cost per hour of such loss of supply;

(c) the relevant TSO, demand facility owner or prospective owner, DSO/CDSO or prospective operator, shall quantify the benefits to the internal market in electricity, cross-border trade and integration of renewable energies, including at least:

- (i) the active power frequency response;
- (ii) the balancing reserves;
- (iii) the reactive power provision;
- (iv) congestion management;
- (v) defence measures;

(d) the relevant TSO shall quantify the costs of applying the necessary rules to existing transmission-connected demand facilities, existing transmission-connected distribution facilities, existing distribution systems, or existing demand units, including at least:

- (i) the direct costs incurred in implementing a requirement;

- (ii) the costs associated with attributable loss of opportunity;
- (iii) the costs associated with resulting changes in maintenance and operation.

## CHAPTER 2

### Derogations

#### *Article 50*

#### **Power to grant derogations**

1. Regulatory authorities may, at the request of a demand facility owner or prospective owner, and a DSO/CDSO or prospective operator, relevant system operator or relevant TSO, grant demand facility owners or prospective owners, and DSOs/CDSOs or prospective operators, relevant system operators or relevant TSOs derogations from one or more provisions of this Regulation for new and existing transmission-connected demand facilities, transmission-connected distribution facilities, distribution systems and demand units in accordance with Articles 51 to 53.
2. Where applicable in a **Contracting Party**, derogations may be granted and revoked in accordance with Articles 51 to 53 by other authorities than the regulatory authority.

#### *Article 51*

#### **General provisions**

1. Each regulatory authority shall specify, after consulting relevant system operators, demand facility owners, DSOs, CDSOs, and other stakeholders whom it deems affected by this Regulation, the criteria for granting derogations pursuant to Articles 52 and 53. It shall publish those criteria on its website and notify them to the **Secretariat** within nine months of **expiry of the deadline for transposition** of this Regulation. The **Secretariat** may require a regulatory authority to amend the criteria if it considers that they are not in line with this Regulation. This possibility to review and amend the criteria for granting derogations shall not affect the derogations already granted which shall continue to apply until the scheduled expiry date as detailed in the decision granting the exemption.
2. If the regulatory authority deems that it is necessary due to a change in circumstances relating to the evolution of system requirements, it may review and amend at most once every year the criteria for granting derogations in accordance with paragraph 1. Any changes to the criteria shall not apply to derogations for which a request has already been made.
3. The regulatory authority may decide that transmission-connected demand facilities, transmission-connected distribution facilities, distribution systems and demand units for which a request for a derogation has been filed pursuant to Articles 52 or 53 do not need to comply with the requirements of this Regulation from which a derogation has been sought from the day of filing the request until the regulatory authority's decision is issued.

## Article 52

### **Request for a derogation by a demand facility owner, a distribution system operator or a closed distribution system operator**

1. Demand facility owners or prospective owners, and DSOs/CDSOs or prospective operators, may request a derogation to one or several requirements of this Regulation for transmission-connected demand facilities, transmission-connected distribution facilities, distribution systems, or demand units used by a demand facility or a closed distribution system to provide demand response services to a relevant system operator and a relevant TSO.
2. A request for a derogation shall be filed with the relevant system operator and include:
  - (a) an identification of the demand facility owner or prospective owner, the DSO/CDSO or prospective operator, and a contact person for any communications;
  - (b) a description of the transmission-connected demand facility, the transmission-connected distribution facility, the distribution system, or the demand unit for which a derogation is requested;
  - (c) a reference to the provisions of this Regulation from which a derogation is requested and a detailed description of the requested derogation;
  - (d) detailed reasoning, with relevant supporting documents and cost-benefit analysis pursuant to the requirements of Article 49;
  - (e) demonstration that the requested derogation would have no adverse effect on cross-border trade.
3. Within two weeks of receipt of a request for a derogation, the relevant system operator shall confirm to the demand facility owner or prospective owner, or to the DSO/CDSO or prospective operator, whether the request is complete. If the relevant system operator considers that the request is incomplete, the demand facility owner or prospective owner, or the DSO/CDSO or prospective operator, shall submit the additional required information within one month from the receipt of the request for additional information. If the demand facility owner or prospective owner, or if the DSO/CDSO or prospective operator, does not supply the requested information within that time limit, the request for a derogation shall be deemed withdrawn.
4. The relevant system operator shall, in coordination with the relevant TSO and any affected adjacent DSO, assess the request for a derogation and the provided cost-benefit analysis, taking into account the criteria determined by the regulatory authority pursuant to Article 51.
5. Within six months of receipt of a request for a derogation, the relevant system operator shall forward the request to the regulatory authority and submit the assessment(s) prepared in accordance with paragraphs 4. That period may be extended by one month where the relevant system operator seeks further information from the demand facility owner or prospective owner, or from the DSO/CDSO or prospective operator, and by two months where the relevant system operator requests the relevant TSO to submit an assessment of the request for a derogation.
6. The regulatory authority shall adopt a decision concerning any request for a derogation within six months from the day after it receives the request. That time limit may be extended by three months before its expiry where the regulatory authority requires further information from the demand facility owner or prospective owner, or from the DSO/CDSO or prospective operator, or from any other interested parties. The additional period shall begin when the complete information has been received.

7. The demand facility owner or prospective owner, or the DSO/CDSO or prospective operator, shall submit any additional information requested by the regulatory authority within two months of such request. If the demand facility owner or prospective owner, or if the DSO/CDSO or prospective operator, does not supply the requested information within that time limit, the request for a derogation shall be deemed withdrawn unless, before its expiry:

(a) the regulatory authority decides to provide an extension; or

(b) the demand facility owner or prospective owner, or the DSO/CDSO or prospective operator, informs the regulatory authority by means of a reasoned submission that the request for a derogation is complete.

8. The regulatory authority shall issue a reasoned decision concerning a request for a derogation. Where the regulatory authority grants a derogation, it shall specify its duration.

9. The regulatory authority shall notify its decision to the relevant demand facility owner or prospective owner, the DSO/CDSO or prospective operator, the relevant system operator and the relevant TSO.

10. A regulatory authority may revoke a decision granting a derogation if the circumstances and underlying reasons no longer apply or upon a reasoned recommendation of the **Secretariat** or reasoned recommendation by the **Energy Community Regulatory Board** pursuant to Article 55(2).

11. For demand units within a demand facility or a closed distribution system connected at a voltage level of or below 1 000 V, a request for a derogation under this Article may be made by a third party on behalf of the demand facility owner or prospective owner, or on behalf of the CDSO or prospective operator. Such a request may be for a single demand unit or multiple demand units within the same demand facility or closed distribution system. In the case of the latter, and provided the cumulative maximum capacity is specified, the third party may substitute the details required by point (a) of paragraph 2 with their details.

### **Article 53**

#### **Request for a derogation by a relevant system operator or relevant TSO**

1. Relevant system operators or relevant TSOs may request derogations for transmission-connected demand facilities, transmission-connected distribution facilities, distribution systems, or demand units within a demand facility or a closed distribution system connected or to be connected to their network.

2. Relevant system operators or relevant TSOs shall submit their requests for a derogation to the regulatory authority. Each request for a derogation shall include:

(a) identification of the relevant system operator or relevant TSO, and a contact person for any communications;

(b) a description of the transmission-connected demand facility, the transmission-connected distribution facility, the distribution system, or the demand unit for which a derogation is requested and the total installed capacity and number of transmission-connected demand facilities, transmission-connected distribution facilities, distribution systems, or demand units;

(c) the requirement or requirements of this Regulation for which a derogation is requested, with a detailed description of the requested derogation;

- (d) detailed reasoning, with all relevant supporting documents;
- (e) demonstration that the requested derogation would have no adverse effect on cross-border trade;
- (f) a cost-benefit analysis pursuant to the requirements of Article 49. If applicable, the cost-benefit analysis shall be carried out in coordination with the relevant TSO and any adjacent DSO.

3. Where the request for a derogation is submitted by a relevant DSO, the regulatory authority shall, within two weeks from the day after receipt of that request, ask the relevant TSO to assess the request for a derogation in the light of the criteria determined by the regulatory authority pursuant to Article 51.

4. Within two weeks from the day after the receipt of such request for assessment, the relevant TSO shall confirm to the relevant DSO whether the request for a derogation is complete. If the relevant TSO considers that it is incomplete, the relevant DSO shall submit the required additional information within one month from the receipt of the request for additional information.

5. Within six months of receipt of a request for a derogation, the relevant TSO shall submit to the regulatory authority its assessment, including any relevant documentation. The six-month time limit may be extended by one month where the relevant TSO seeks further information from the relevant DSO.

6. The regulatory authority shall adopt a decision concerning a request for a derogation within six months from the day after it receives the request. Where the request for a derogation is submitted by the relevant DSO, the six-month time limit runs from the day following receipt of the relevant TSO's assessment pursuant to paragraph 5.

7. The six-month time limit referred to in paragraph 6 may, before its expiry, be extended by an additional three months where the regulatory authority requests further information from the relevant system operator requesting the derogation or from any other interested parties. That additional period shall run from the day following the date of receipt of the complete information.

The relevant system operator shall provide any additional information requested by the regulatory authority within two months from the date of the request. If the relevant system operator does not provide the requested additional information within that time limit, the request for a derogation shall be deemed withdrawn unless, before expiry of the time limit:

- (a) the regulatory authority decides to provide an extension; or
- (b) the relevant system operator informs the regulatory authority by means of a reasoned submission that the request for a derogation is complete.

8. The regulatory authority shall issue a reasoned decision concerning a request for a derogation. Where the regulatory authority grants derogation, it shall specify its duration.

9. The regulatory authority shall notify its decision to the relevant system operator requesting the derogation, the relevant TSO, **the Secretariat and the Energy Community Regulatory Board**.

10. Regulatory authorities may lay down further requirements concerning the preparation of requests for a derogation by relevant system operators. In doing so, regulatory authorities shall take into account the delineation between the transmission system and the distribution system at the national level and shall consult with system operators, demand facility owners and stakeholders, including manufacturers.

11. A regulatory authority may revoke a decision granting a derogation if the circumstances and

underlying reasons no longer apply or upon a reasoned recommendation of the **Secretariat** or reasoned recommendation by the **Energy Community Regulatory Board** pursuant to Article 55(2).

#### **Article 54**

##### **Register of derogations from the requirements of this Regulation**

1. Regulatory authorities shall maintain a register of all derogations they have granted or refused and shall provide the **Secretariat and the Energy Community Regulatory Board** with an updated and consolidated register at least once every six months, a copy of which shall be given to ENTSO for Electricity.
2. The register shall contain, in particular:
  - (a) the requirement or requirements for which the derogation is granted or refused;
  - (b) the content of the derogation;
  - (c) the reasons for granting or refusing the derogation;
  - (d) the consequences resulting from granting the derogation.

#### **Article 55**

##### **Monitoring of derogations**

1. The **Secretariat and the Energy Community Regulatory Board** shall monitor the procedure of granting derogations with the cooperation of the regulatory authorities or relevant authorities of the **Contracting Party**. Those authorities or relevant authorities of the **Contracting Party** shall provide the **Secretariat and Energy Community Regulatory Board** with all the information necessary for that purpose.
2. The **Energy Community Regulatory Board** may issue a reasoned recommendation to a regulatory authority to revoke a derogation due to a lack of justification. The **Secretariat** may issue a reasoned recommendation to a regulatory authority or relevant authority of the **Contracting Party** to revoke a derogation due to a lack of justification.
3. The **Secretariat** may request the **Energy Community Regulatory Board** to report on the application of paragraphs 1 and 2 and to provide reasons for requesting or not requesting derogations to be revoked.

## TITLE VI

### NON-BINDING GUIDANCE AND MONITORING OF IMPLEMENTATION

#### *Article 56*

#### **Non-binding guidance on implementation**

1. <...>
2. <...>
3. The non-binding guidance **published by ENTSO for Electricity** explains the technical issues, conditions and interdependencies which need to be considered when complying with the requirements of this Regulation at national level.

#### *Article 57*

#### **Monitoring**

1. ENTSO for Electricity shall monitor the implementation of this Regulation **for the Contracting Parties whose TSOs are members of ENTSO for Electricity. The Secretariat and the Energy Community Regulatory Board shall monitor the implementation of this Regulation for the Contracting Parties whose TSOs are not members of ENTSO for Electricity....** Monitoring shall take into account the list of relevant information developed by the Agency for the Cooperation of Energy Regulators and it shall cover in particular the following matters:

- (a) identification of any divergences in the national implementation of this Regulation;
- (b) assessment of whether the choice of values and ranges in the requirements applicable to transmission-connected demand facilities, transmission-connected distribution facilities, distribution systems and demand units under this Regulation continues to be valid.

**ENTSO for Electricity shall report its findings to the Secretariat and the Energy Community Regulatory Board. The Secretariat and the Energy Community Regulatory Board shall make available the findings stemming from the monitoring of the implementation of this Regulation.**

2. <...>
3. Relevant TSOs shall submit to **the Secretariat, the Energy Community Regulatory Board and ENTSO for Electricity** the information required to perform the tasks referred to in paragraph 1<...>  
Based on a request of the regulatory authority, DSOs shall provide TSOs with information under paragraph 1 unless the information is already obtained by regulatory authorities, the **Secretariat, the Energy Community Regulatory Board** or ENTSO-E in relation to their respective implementation monitoring tasks, with the objective of avoiding duplication of information.
4. <...>

## TITLE VII

### FINAL PROVISIONS

#### **Article 58**

#### **Amendment of contracts and general terms and conditions**

1. Regulatory authorities shall ensure that all relevant clauses in contracts and general terms and conditions relating to the grid connection of new transmission-connected demand facilities, new transmission-connected distribution facilities, new distribution systems and new demand units are brought into compliance with the requirements of this Regulation.
2. All relevant clauses in contracts and relevant clauses of general terms and conditions relating to the grid connection of existing transmission-connected demand facilities, existing transmission-connected distribution facilities, existing distribution systems and existing demand units subject to all or some of the requirements of this Regulation in accordance with paragraph 1 of Article 4 shall be amended in order to comply with the requirements of this Regulation. The relevant clauses shall be amended within three years following the decision of the regulatory authority or **Contracting Party** as referred to in Article 4(1).
3. Regulatory authorities shall ensure that agreements between system operators and owners of new or existing demand facilities or operators of new or existing distribution systems subject to this Regulation and relating to grid connection requirements for transmission-connected demand facilities, transmission-connected distribution facilities, distribution systems and demand units used by a demand facility or a closed distribution system to provide demand response services to relevant system operators and relevant TSOs, in particular in national network codes, reflect the requirements set out in this Regulation.

#### **Article 59**

#### **Entry into force<sup>1</sup>**

1. **Each Contracting Party shall transpose Regulation (EU) 2016/1388 no later than by 12 June 2018.**
2. **Transposition shall be made without changes to the structure and text of Regulation (EU) 2016/1388 other than translation and the adaptations made by the present Decision [2018/05/PHLG-EnC]**
3. **Each Contracting Party shall notify the Energy Community Secretariat of completed transposition and of any subsequent changes made to the act transposing Regulation (EU) 2016/1388 within two weeks following the adoption of such measures.**
4. **Articles 4(2) points (a) and (b), 6(4), 51(1), 56 and 57 of Regulation (EU) 2016/1388 shall be implemented as of the expiry of the transposition deadline.**

<sup>1</sup> Adapted by Article 1 of Decision 2018/05/PHLG-EnC of the Permanent High Level Group.

**5. Without prejudice to paragraph 4, Regulation (EU) 2016/1388 shall be implemented no later than by 12 June 2021.**

**6. In transposing this Decision, Contracting Parties shall task their national regulatory authorities with the monitoring of and enforcing compliance with this Decision [2018/05/PHLG-EnC].**

## ANNEX I

## Frequency ranges and time periods referred to in Article 12(1)

Synchronous area	Frequency range	Time period for operation
<b>Continental Europe, Ukraine</b>	47,5 Hz-48,5 Hz	To be specified by each TSO, but not less than 30 minutes
	48,5 Hz-49,0 Hz	To be specified by each TSO, but not less than the period for 47,5 Hz-48,5 Hz
	49,0 Hz-51,0 Hz	Unlimited
	51,0 Hz-51,5 Hz	30 minutes
<b>Nordic</b>	47,5 Hz-48,5 Hz	30 minutes
	48,5 Hz-49,0 Hz	To be specified by each TSO, but not less than 30 minutes
	49,0 Hz-51,0 Hz	Unlimited
	51,0 Hz-51,5 Hz	30 minutes
<b>Great Britain</b>	47,0 Hz-47,5 Hz	20 seconds
	47,5 Hz-48,5 Hz	90 minutes
	48,5 Hz-49,0 Hz	To be specified by each TSO, but not less than 90 minutes
	49,0 Hz-51,0 Hz	Unlimited
	51,0 Hz-51,5 Hz	90 minutes
	51,5 Hz-52,0 Hz	15 minutes
<b>Ireland and Northern Ireland</b>	47,5 Hz-48,5 Hz	90 minutes
	48,5 Hz-49,0 Hz	To be specified by each TSO, but not less than 90 minutes
	49,0 Hz-51,0 Hz	Unlimited
	51,0 Hz-51,5 Hz	90 minutes
<b>Baltic, Moldova</b>	47,5 Hz-48,5 Hz	To be specified by each TSO, but not less than 30 minutes
	48,5 Hz-49,0 Hz	To be specified by each TSO, but not less than the period for 47,5 Hz-48,5 Hz
	49,0 Hz-51,0 Hz	Unlimited
	51,0 Hz-51,5 Hz	To be specified by each TSO, but not less than 30 minutes

<b>Georgia</b>	<b>47,5 Hz-48,5 Hz</b>	<b>Not less than 30 minutes</b>
	<b>48,5 Hz-49,0 Hz</b>	<b>Not less than 60 minutes</b>
	<b>49,0 Hz-51,0 Hz</b>	<b>Unlimited</b>
	<b>51,0 Hz-51,5 Hz</b>	<b>Not less than 30 minutes</b>

The table shows the minimum time periods for which a transmission-connected demand facility, a transmission-connected distribution facility or a distribution system has to be capable of operating on different frequencies, deviating from a nominal value, without disconnecting from the network.

## ANNEX II

## Voltage ranges and time periods referred to in Article 13(1)

Synchronous area	Voltage range	Time period for operation
Continental Europe, Ukraine	0,90 pu-1,118 pu	Unlimited
	1,118 pu-1,15 pu	To be specified by each TSO but not less than 20 minutes and not more than 60 minutes
Nordic	0,90 pu-1,05 pu	Unlimited
	1,05 pu-1,10 pu	60 minutes
Great Britain	0,90 pu-1,10 pu	Unlimited
Ireland and Northern Ireland	0,90 pu-1,118 pu	Unlimited
Baltic, Moldova	0,90 pu-1,118 pu	Unlimited
	1,118 pu-1,15 pu	20 minutes
Georgia	<b>0,85 pu–0,90 pu</b>	<b>30 minutes</b>
	<b>0,90 pu–1,12 pu</b>	<b>Unlimited</b>
	<b>1,12 pu–1,15 pu</b>	<b>20 minutes</b>

The table shows the minimum time periods during which a transmission-connected demand facility, a transmission-connected distribution facility or a transmission-connected distribution system has to be capable of operating for voltages deviating from the reference 1 pu value at the connection point without disconnecting from the network where the voltage base for pu values is at or above 110 kV and up to (not including) 300 kV.

Synchronous area	Voltage range	Time period for operation
Continental Europe, Ukraine	0,90 pu-1,05 pu	Unlimited
	1,05 pu-1,10 pu	To be specified by each TSO but not less than 20 minutes and not more than 60 minutes
Nordic	0,90 pu-1,05 pu	Unlimited
	1,05 pu-1,10 pu	To be specified by each TSO but not more than 60 minutes
Great Britain	0,90 pu-1,05 pu	Unlimited
	1,05 pu-1,10 pu	15 minutes
Ireland and Northern Ireland	0,90 pu-1,05 pu	Unlimited

<b>Baltic, Moldova</b>	0,90 pu-1,097 pu	Unlimited
	1,097 pu-1,15 pu	20 minutes
<b>Georgia</b>	<b>0,85 pu–0,90 pu</b>	<b>20 minutes</b>
	<b>0,90 pu–1,10 pu</b>	<b>Unlimited</b>
	<b>1,10 pu–1,15 pu</b>	<b>20 minutes</b>

The table shows the minimum time periods during which a transmission-connected demand facility, a transmission-connected distribution facility or a transmission-connected distribution system has to be capable of operating for voltages deviating from the reference 1 pu value at the connection point without disconnecting from the network, where the voltage base for pu values is from 300 kV to **500 kV** (including).

## REGULATION (EU) 2016/631 of 14 April 2016 establishing a network code on requirements for grid connection of generators

Incorporated and adapted by Permanent High Level Group Decision 2018/03/PHLG-EnC of 12 January 2018

*The adaptations made by Permanent High Level Group Decision 2018/03/PHLG-EnC are highlighted in **bold and blue**.*

Whereas:

(1) The swift completion of a fully functioning and interconnected internal energy market is crucial to maintaining security of energy supply, increasing competitiveness and ensuring that all consumers can purchase energy at affordable prices.

(2) Regulation (EC) No 714/2009 sets out non-discriminatory rules governing access to the network for cross-border exchanges in electricity with a view to ensuring the proper functioning of the internal market in electricity. In addition Article 5 of Directive 2009/72/EC of the European Parliament and of the Council requires that Member States or, where Member States have so provided, regulatory authorities ensure, *inter alia*, that objective and non-discriminatory technical rules are developed which establish minimum technical design and operational requirements for the connection to the system. Where requirements constitute terms and conditions for connection to national networks, Article 37(6) of the same Directive requires regulatory authorities to be responsible for fixing or approving at least the methodologies used to calculate or establish them. In order to provide system security within the interconnected transmission system, it is essential to establish a common understanding of the requirements applicable to power-generating modules. Those requirements that contribute to maintaining, preserving and restoring system security in order to facilitate proper functioning of the internal electricity market within and between synchronous areas, and to achieve cost efficiencies, should be regarded as cross-border network issues and market integration issues.

(3) Harmonised rules for grid connection for power-generating modules should be set out in order to provide a clear legal framework for grid connections, facilitate Union-wide trade in electricity, ensure system security, facilitate the integration of renewable electricity sources, increase competition and allow more efficient use of the network and resources, for the benefit of consumers.

(4) System security depends partly on the technical capabilities of power-generating modules. Therefore regular coordination at the level of the transmission and distribution networks and adequate performance of the equipment connected to the transmission and distribution networks with sufficient robustness to cope with disturbances and to help to prevent any major disruption or to facilitate restoration of the system after a collapse are fundamental prerequisites.

(5) Secure system operation is only possible if there is close cooperation between power-generating facility owners and system operators. In particular, the functioning of the system under abnormal operating conditions depends on the response of power-generating modules to deviations from the reference 1 per unit (pu) values of voltage and nominal frequency. In the context of system security, the networks and the power-generating modules should be considered as one entity from a system

engineering point of view, given that those parts are interdependent. Therefore, as a prerequisite for grid connection, relevant technical requirements should be set for powergenerating modules.

(6) Regulatory authorities should consider the reasonable costs effectively incurred by system operators in the implementation of this Regulation when fixing or approving transmission or distribution tariffs or their methodologies or when approving the terms and conditions for connection and access to national networks in accordance with Article 37(1) and (6) of Directive 2009/72/EC and with Article 14 of Regulation (EC) No 714/2009.

(7) Different synchronous electricity systems in the Union have different characteristics which need to be taken into account when setting the requirements for generators. It is therefore appropriate to consider regional specificities when establishing network connection rules as required by Article 8(6) of Regulation (EC) No 714/2009.

(8) In view of the need to provide regulatory certainty, the requirements of this Regulation should apply to new generating facilities but should not apply to existing generating modules and generating modules already at an advanced stage of planning but not yet completed unless the relevant regulatory authority or Member State decides otherwise based on evolution of system requirements and a full cost-benefit analysis, or where there has been substantial modernisation of those generating facilities.

(9) The significance of power-generating modules should be based on their size and their effect on the overall system. Synchronous machines should be classed on the machine size and include all the components of a generating facility that normally run indivisibly, such as separate alternators driven by the separate gas and steam turbines of a single combined-cycle gas turbine installation. For a facility including several such combined-cycle gas turbine installations, each should be assessed on its size, and not on the whole capacity of the facility. Nonsynchronously connected power-generating units, where they are collected together to form an economic unit and where they have a single connection point should be assessed on their aggregated capacity.

(10) In view of the different voltage level at which generators are connected and their maximum generating capacity, this Regulation should make a distinction between different types of generators by establishing different levels of requirements. This Regulation does not set the rules to determine the voltage level of the connection point to which the power-generating module shall be connected.

(11) The requirements applicable to type A power-generating modules should be set at the basic level necessary to ensure capabilities of generation with limited automated response and minimal system operator control. They should ensure that there is no large-scale loss of generation over system operational ranges, thereby minimising critical events, and include requirements necessary for widespread intervention during system-critical events.

(12) The requirements applicable to type B power-generating modules should provide for a wider range of automated dynamic response with greater resilience to operational events, in order to ensure the use of this dynamic response, and a higher level of system operator control and information to utilise those capabilities. They ensure an automated response to mitigate the impact of, and maximise dynamic generation response to, system events.

(13) The requirements applicable to type C power-generating modules should provide for a refined, stable and highly controllable real-time dynamic response aiming to provide principle ancillary services to ensure security of supply. Those requirements should cover all system states with consequential

detailed specification of interactions of requirements, functions, control and information to utilise those capabilities and ensure the real-time system response necessary to avoid, manage and respond to system events. Those requirements should also provide for sufficient capability of generating modules to respond to both intact and system disturbed situations, and should provide the information and control necessary to utilise generation in different situations.

(14) The requirements applicable to type D power-generating modules should be specific to higher voltage connected generation with an impact on control and operation of the entire system. They should ensure stable operation of the interconnected system, allowing the use of ancillary services from generation Europe-wide.

(15) The requirements should be based on the principles of non-discrimination and transparency as well as on the principle of optimisation between the highest overall efficiency and lowest total cost for all involved parties. Therefore those requirements should reflect the differences in the treatment of generation technologies with different inherent characteristics, and avoid unnecessary investments in some geographical areas in order to take into account their respective regional specificities. Transmission system operators ('TSOs') and distribution system operators ('DSOs') including closed distribution system operators ('CDSOs') can take those differences into account when defining the requirements in accordance with the provisions of this Regulation, whilst recognising that the thresholds which determine whether a system is a transmission system or a distribution system are established at the national level.

(16) Due to its cross-border impact, this Regulation should aim at the same frequency-related requirements for all voltage levels, at least within a synchronous area. That is necessary because, within a synchronous area, a change in frequency in one Member State would immediately impact frequency and could damage equipment in all other Member States.

(17) To ensure system security, it should be possible for power-generating modules in each synchronous area of the interconnected system to remain connected to the system for specified frequency and voltage ranges.

(18) This Regulation should provide for ranges of parameters for national choices for fault-ride-through capability to maintain a proportionate approach reflecting varying system needs such as the level of renewable energy sources ('RES') and existing network protection schemes, both transmission and distribution. In view of the configuration of some networks, the upper limit for fault-ride-through requirements should be 250 milliseconds. However, given that the most common fault clearing time in Europe is currently 150 milliseconds it leaves scope for the entity, as designated by the Member State to approve the requirements of this Regulation, to verify that a longer requirement is necessary before approving it.

(19) When defining the pre-fault and post-fault conditions for the fault-ride-through capability, taking into account system characteristics such as network topology and generation mix, the relevant TSO should decide whether priority is given to pre-fault operating conditions of power-generating modules or to longer fault clearance times.

(20) Ensuring appropriate reconnection after an incidental disconnection due to a network disturbance is important to the functioning of the interconnected system. Proper network protection is essential for maintaining system stability and security, particularly in case of disturbances to the system. Protection

schemes can prevent aggravation of disturbances and limit their consequences.

(21) Adequate information exchange between system operators and power-generating facility owners is a prerequisite for enabling system operators to maintain system stability and security. System operators need to have a continuous overview of the state of the system, which includes information on the operating conditions of power-generating modules, as well as the possibility to communicate with them in order to direct operational instructions.

(22) In emergency situations which could endanger system stability and security, system operators should have the possibility to instruct that the output of power-generating modules be adjusted in a way which allows system operators to meet their responsibilities for system security.

(23) Voltage ranges should be coordinated between interconnected systems because they are crucial to secure planning and operation of a power system within a synchronous area. Disconnections because of voltage disturbances have an impact on neighbouring systems. Failure to specify voltage ranges could lead to widespread uncertainty in planning and operation of the system with respect to operation beyond normal operating conditions.

(24) The reactive power capability needs depend on several factors including the degree of network meshing and the ratio of in-feed and consumption, which should be taken into account when establishing reactive power requirements. When regional system characteristics vary within a systems operator's area of responsibility, more than one profile could be appropriate. Reactive power production, known as lagging, at high voltages and reactive power consumption, known as leading, at low voltages might not be necessary. Reactive power requirements could put constraints on the design and operation of power-generating facilities. Therefore it is important that the capabilities actually required for efficient system operation be thoroughly assessed.

(25) Synchronous power-generating modules have an inherent capability to resist or slow down frequency deviations, a characteristic which many RES technologies do not have. Therefore countermeasures should be adopted, to avoid a larger rate of change of frequency during high RES production. Synthetic inertia could facilitate further expansion of RES, which do not naturally contribute to inertia.

(26) Appropriate and proportionate compliance testing should be introduced so that system operators can ensure operational security.

(27) The regulatory authorities, Member States and system operators should ensure that, in the process of developing and approving the requirements for network connection, they are harmonised to the extent possible, in order to ensure full market integration. Established technical standards should be taken into particular consideration in the development of connection requirements.

(28) A process for derogating from the rules should be set out in this Regulation to take into account local circumstances where exceptionally, for example, compliance with those rules could jeopardise the stability of the local network or where the safe operation of a power-generating module might require operating conditions that are not in line with the Regulation. In the case of particular combined heat and power plants, which bring wider efficiency benefits, applying the rules set out in this Regulation could result in disproportionate costs and lead to the loss of those efficiency benefits.

(29) Subject to approval by the relevant regulatory authority, or other authority where applicable in a Member State, system operators should be allowed to propose derogations for certain classes of power-generating modules. (30) This Regulation has been adopted on the basis of Regulation (EC)

No 714/2009 which it supplements and of which it forms an integral part. References to Regulation (EC) No 714/2009 in other legal acts should be understood as also referring to this Regulation.

(31) The measures provided for in this Regulation are in accordance with the opinion of the Committee referred to in Article 23(1) of Regulation (EC) No 714/2009.

## TITLE I GENERAL PROVISIONS

### *Article 1*

#### **Subject matter**

This Regulation establishes a network code which lays down the requirements for grid connection of power-generating facilities, namely synchronous power-generating modules, power park modules and offshore power park modules, to the interconnected system. It, therefore, helps to ensure fair conditions of competition in the internal electricity market, to ensure system security and the integration of renewable electricity sources, and to facilitate **Energy Community wide** trade in electricity.

This regulation also lays down the obligations for ensuring that system operators make appropriate use of the power-generating facilities' capabilities in a transparent and non-discriminatory manner to provide a level playing field throughout the **Energy Community**.

### *Article 2*

#### **Definitions**

For the purposes of this Regulation, the definitions in Article 2 of Directive 2012/27/EU of the European Parliament and of the Council, Article 2 of Regulation (EC) No 714/2009, <...>, Article 2 of Commission Regulation (EU) No 543/2013 and Article 2 of Directive 2009/72/EC shall apply.

In addition, the following definitions shall apply:

- (1) 'entity' means a regulatory authority, other national authority, system operator or other public or private body appointed under national law;
- (2) 'synchronous area' means an area covered by synchronously interconnected TSOs, such as the synchronous areas of Continental Europe, Great Britain, Ireland-Northern Ireland and Nordic and the power systems of Lithuania, Latvia and Estonia, together referred to as 'Baltic' which are part of a wider synchronous area **and the power systems of Georgia, Moldova and Ukraine**;
- (3) 'voltage' means the difference in electrical potential between two points measured as the root-mean-square value of the positive sequence phase-to-phase voltages at fundamental frequency;
- (4) 'apparent power' means the product of voltage and current at fundamental frequency, and the square root of three in the case of three-phase systems, usually expressed in kilovolt-amperes ('kVA') or megavolt-amperes ('MVA');
- (5) 'power-generating module' means either a synchronous power-generating module or a power

park module;

(6) 'power-generating facility' means a facility that converts primary energy into electrical energy and which consists of one or more power-generating modules connected to a network at one or more connection points;

(7) 'power-generating facility owner' means a natural or legal entity owning a power-generating facility;

(8) 'main generating plant' means one or more of the principal items of equipment required to convert the primary source of energy into electricity;

(9) 'synchronous power-generating module' means an indivisible set of installations which can generate electrical energy such that the frequency of the generated voltage, the generator speed and the frequency of network voltage are in a constant ratio and thus in synchronism;

(10) 'power-generating module document' or 'PGMD' means a document provided by the power-generating facility owner to the relevant system operator for a type B or C power-generating module which confirms that the power-generating module's compliance with the technical criteria set out in this Regulation has been demonstrated and provides the necessary data and statements, including a statement of compliance;

(11) 'relevant TSO' means the TSO in whose control area a power-generating module, a demand facility, a distribution system or a HVDC system is or will be connected to the network at any voltage level;

(12) 'network' means a plant and apparatus connected together in order to transmit or distribute electricity;

(13) 'relevant system operator' means the transmission system operator or distribution system operator to whose system a power-generating module, demand facility, distribution system or HVDC system is or will be connected;

(14) 'connection agreement' means a contract between the relevant system operator and either the power-generating facility owner, demand facility owner, distribution system operator or HVDC system owner, which includes the relevant site and specific technical requirements for the power-generating facility, demand facility, distribution system, distribution system connection or HVDC system;

(15) 'connection point' means the interface at which the power-generating module, demand facility, distribution system or HVDC system is connected to a transmission system, offshore network, distribution system, including closed distribution systems, or HVDC system, as identified in the connection agreement;

(16) 'maximum capacity' or ' $P_{max}$ ' means the maximum continuous active power which a power-generating module can produce, less any demand associated solely with facilitating the operation of that power-generating module and not fed into the network as specified in the connection agreement or as agreed between the relevant system operator and the power-generating facility owner;

(17) 'power park module' or 'PPM' means a unit or ensemble of units generating electricity, which is either non-synchronously connected to the network or connected through power electronics, and that also has a single connection point to a transmission system, distribution system including closed distribution system or HVDC system;

(18) 'offshore power park module' means a power park module located offshore with an offshore connection point;

- (19) 'synchronous compensation operation' means the operation of an alternator without prime mover to regulate voltage dynamically by production or absorption of reactive power;
- (20) 'active power' means the real component of the apparent power at fundamental frequency, expressed in watts or multiples thereof such as kilowatts ('kW') or megawatts ('MW');
- (21) 'pump-storage' means a hydro unit in which water can be raised by means of pumps and stored to be used for the generation of electrical energy;
- (22) 'frequency' means the electric frequency of the system expressed in hertz that can be measured in all parts of the synchronous area under the assumption of a consistent value for the system in the time frame of seconds, with only minor differences between different measurement locations. Its nominal value is 50Hz;
- (23) 'droop' means the ratio of a steady-state change of frequency to the resulting steady-state change in active power output, expressed in percentage terms. The change in frequency is expressed as a ratio to nominal frequency and the change in active power expressed as a ratio to maximum capacity or actual active power at the moment the relevant threshold is reached;
- (24) 'minimum regulating level' means the minimum active power, as specified in the connection agreement or as agreed between the relevant system operator and the power-generating facility owner, down to which the power-generating module can control active power;
- (25) 'setpoint' means the target value for any parameter typically used in control schemes;
- (26) 'instruction' means any command, within its authority, given by a system operator to a power-generating facility owner, demand facility owner, distribution system operator or HVDC system owner in order to perform an action;
- (27) 'secured fault' means a fault which is successfully cleared according to the system operator's planning criteria;
- (28) 'reactive power' means the imaginary component of the apparent power at fundamental frequency, usually expressed in kilovar ('kVAR') or megavar ('MVAR');
- (29) 'fault-ride-through' means the capability of electrical devices to be able to remain connected to the network and operate through periods of low voltage at the connection point caused by secured faults;
- (30) 'alternator' means a device that converts mechanical energy into electrical energy by means of a rotating magnetic field;
- (31) 'current' means the rate at which electric charge flows which is measured by the root-mean-square value of the positive sequence of the phase current at fundamental frequency;
- (32) 'stator' means the portion of a rotating machine which includes the stationary magnetic parts with their associated windings;
- (33) 'inertia' means the property of a rotating rigid body, such as the rotor of an alternator, such that it maintains its state of uniform rotational motion and angular momentum unless an external torque is applied;
- (34) 'synthetic inertia' means the facility provided by a power park module or HVDC system to replace the effect of inertia of a synchronous power-generating module to a prescribed level of performance;
- (35) 'frequency control' means the capability of a power-generating module or HVDC system to adjust its active power output in response to a measured deviation of system frequency from a setpoint, in

order to maintain stable system frequency;

(36) 'frequency sensitive mode' or 'FSM' means the operating mode of a power-generating module or HVDC system in which the active power output changes in response to a change in system frequency, in such a way that it assists with the recovery to target frequency;

(37) 'limited frequency sensitive mode — overfrequency' or 'LFSM-O' means a power-generating module or HVDC system operating mode which will result in active power output reduction in response to a change in system frequency above a certain value;

(38) 'limited frequency sensitive mode — underfrequency' or 'LFSM-U' means a power-generating module or HVDC system operating mode which will result in active power output increase in response to a change in system frequency below a certain value;

(39) 'frequency response deadband' means an interval used intentionally to make the frequency control unresponsive;

(40) 'frequency response insensitivity' means the inherent feature of the control system specified as the minimum magnitude of change in the frequency or input signal that results in a change of output power or output signal;

(41) 'P-Q-capability diagram' means a diagram describing the reactive power capability of a power-generating module in the context of varying active power at the connection point;

(42) 'steady-state stability' means the ability of a network or a synchronous power-generating module to revert and maintain stable operation following a minor disturbance;

(43) 'island operation' means the independent operation of a whole network or part of a network that is isolated after being disconnected from the interconnected system, having at least one power-generating module or HVDC system supplying power to this network and controlling the frequency and voltage;

(44) 'houseload operation' means the operation which ensures that power-generating facilities are able to continue to supply their in-house loads in the event of network failures resulting in power-generating modules being disconnected from the network and tripped onto their auxiliary supplies;

(45) 'black start capability' means the capability of recovery of a power-generating module from a total shutdown through a dedicated auxiliary power source without any electrical energy supply external to the power-generating facility;

(46) 'authorised certifier' means an entity that issues equipment certificates and power-generating module documents and whose accreditation is given by the national affiliate of the European cooperation for Accreditation ('EA') **or another competent national authority**;

(47) 'equipment certificate' means a document issued by an authorised certifier for equipment used by a power-generating module, demand unit, distribution system, demand facility or HVDC system. The equipment certificate defines the scope of its validity at a national or other level at which a specific value is selected from the range allowed at a European level. For the purpose of replacing specific parts of the compliance process, the equipment certificate may include models that have been verified against actual test results;

(48) 'excitation control system' means a feedback control system that includes the synchronous machine and its excitation system;

- (49) 'U-Q/P<sub>max</sub>-profile' means a profile representing the reactive power capability of a power-generating module or HVDC converter station in the context of varying voltage at the connection point;
- (50) 'minimum stable operating level' means the minimum active power, as specified in the connection agreement or as agreed between the relevant system operator and the power-generating facility owner, at which the power-generating module can be operated stably for an unlimited time;
- (51) 'overexcitation limiter' means a control device within the AVR which prevents the rotor of an alternator from overloading by limiting the excitation current;
- (52) 'underexcitation limiter' means a control device within the AVR, the purpose of which is to prevent the alternator from losing synchronism due to lack of excitation;
- (53) 'automatic voltage regulator' or 'AVR' means the continuously acting automatic equipment controlling the terminal voltage of a synchronous power-generating module by comparing the actual terminal voltage with a reference value and controlling the output of an excitation control system;
- (54) 'power system stabiliser' or 'PSS' means an additional functionality of the AVR of a synchronous power-generating module whose purpose is to damp power oscillations;
- (55) 'fast fault current' means a current injected by a power park module or HVDC system during and after a voltage deviation caused by an electrical fault with the aim of identifying a fault by network protection systems at the initial stage of the fault, supporting system voltage retention at a later stage of the fault and system voltage restoration after fault clearance;
- (56) 'power factor' means the ratio of the absolute value of active power to apparent power;
- (57) 'slope' means the ratio of the change in voltage, based on reference 1 pu voltage, to a change in reactive power in-feed from zero to maximum reactive power, based on maximum reactive power;
- (58) 'offshore grid connection system' means the complete interconnection between an offshore connection point and the onshore system at the onshore grid interconnection point;
- (59) 'onshore grid interconnection point' means the point at which the offshore grid connection system is connected to the onshore network of the relevant system operator;
- (60) 'installation document' means a simple structured document containing information about a type A power-generating module or a demand unit, with demand response connected below 1 000 V, and confirming its compliance with the relevant requirements;
- (61) 'statement of compliance' means a document provided by the power-generating facility owner, demand facility owner, distribution system operator or HVDC system owner to the system operator stating the current status of compliance with the relevant specifications and requirements;
- (62) 'final operational notification' or 'FON' means a notification issued by the relevant system operator to a power-generating facility owner, demand facility owner, distribution system operator or HVDC system owner who complies with the relevant specifications and requirements, allowing them to operate respectively a power-generating module, demand facility, distribution system or HVDC system by using the grid connection;
- (63) 'energisation operational notification' or 'EON' means a notification issued by the relevant system operator to a power-generating facility owner, demand facility owner, distribution system operator or HVDC system owner prior to energisation of its internal network;
- (64) 'interim operational notification' or 'ION' means a notification issued by the relevant system opera-

tor to a power-generating facility owner, demand facility owner, distribution system operator or HVDC system owner which allows them to operate respectively a power-generating module, demand facility, distribution system or HVDC system by using the grid connection for a limited period of time and to initiate compliance tests to ensure compliance with the relevant specifications and requirements; (65) 'limited operational notification' or 'LON' means a notification issued by the relevant system operator to a power-generating facility owner, demand facility owner, distribution system operator or HVDC system owner who had previously attained FON status but is temporarily subject to either a significant modification or loss of capability resulting in non-compliance with the relevant specifications and requirements.

### **Article 3**

#### **Scope of application**

1. The connection requirements set out in this Regulation shall apply to new power-generating modules which are considered significant in accordance with Article 5, unless otherwise provided.

The relevant system operator shall refuse to allow the connection of a power-generating module which does not comply with the requirements set out in this Regulation and which is not covered by a derogation granted by the regulatory authority, or other authority where applicable in a **Contracting Party** pursuant to Article 60. The relevant system operator shall communicate such refusal, by means of a reasoned statement in writing, to the power-generating facility owner and, unless specified otherwise by the regulatory authority, to the regulatory authority.

2. This Regulation shall not apply to:

(b) power-generating modules that were installed to provide back-up power and operate in parallel with the system for less than five minutes per calendar month while the system is in normal system state. Parallel operation during maintenance or commissioning tests of that power-generating module shall not count towards the five-minute limit;

(c) power-generating modules that do not have a permanent connection point and are used by the system operators to temporarily provide power when normal system capacity is partly or completely unavailable;

(d) storage devices except for pump-storage power-generating modules in accordance with Article 6(2).

### **Article 4**

#### **Application to existing power-generating modules**

1. Existing power-generating modules are not subject to the requirements of this Regulation, except where:

(a) a type C or type D power-generating module has been modified to such an extent that its connection agreement must be substantially revised in accordance with the following procedure:

(i) power-generating facility owners who intend to undertake the modernisation of a plant or replacement of equipment impacting the technical capabilities of the power-generating module shall notify their plans to the relevant system operator in advance;

(ii) if the relevant system operator considers that the extent of the modernisation or replacement of equipment is such that a new connection agreement is required, the system operator shall notify the relevant regulatory authority or, where applicable, the **Contracting Party**; and

(iii) the relevant regulatory authority or, where applicable, the **Contracting Party** shall decide if the existing connection agreement needs to be revised or a new connection agreement is required and which requirements of this Regulation shall apply; or

(b) a regulatory authority or, where applicable, a **Contracting Party** decides to make an existing power-generating module subject to all or some of the requirements of this Regulation, following a proposal from the relevant TSO in accordance with paragraphs 3, 4 and 5.

2. For the purposes of this Regulation, a power-generating module shall be considered existing if:

(a) it is already connected to the network on the date of **expiry of the deadline for transposition** of this Regulation; or

(b) the power-generating facility owner has concluded a final and binding contract for the purchase of the main generating plant by two years after **the expiry of the deadline for transposition** of the Regulation. The power-generating facility owner must notify the relevant system operator and relevant TSO of conclusion of the contract within 30 months after the **expiry of the deadline for transposition**.

The notification submitted by the power-generating facility owner to the relevant system operator and to the relevant TSO shall at least indicate the contract title, its date of signature and date of entry into force and the specifications of the main generating plant to be constructed, assembled or purchased.

A **Contracting Party** may provide that in specified circumstances the regulatory authority may determine whether the power-generating module is to be considered an existing power-generating module or a new power-generating module.

3. Following a public consultation in accordance with Article 10 and in order to address significant factual changes in circumstances, such as the evolution of system requirements including penetration of renewable energy sources, smart grids, distributed generation or demand response, the relevant TSO may propose to the regulatory authority concerned, or where applicable, to the **Contracting Party** to extend the application of this Regulation to existing power-generating modules.

For that purpose a sound and transparent quantitative cost-benefit analysis shall be carried out, in accordance with Articles 38 and 39. The analysis shall indicate:

(a) the costs, in regard to existing power-generating modules, of requiring compliance with this Regulation;

(b) the socioeconomic benefit resulting from applying the requirements set out in this Regulation; and

(c) the potential of alternative measures to achieve the required performance.

4. Before carrying out the quantitative cost-benefit analysis referred to in paragraph 3, the relevant TSO shall:

(a) carry out a preliminary qualitative comparison of costs and benefits;

(b) obtain approval from the relevant regulatory authority or, where applicable, the **Contracting Party**.

5. The relevant regulatory authority or, where applicable, the **Contracting Party** shall decide on the extension of the applicability of this Regulation to existing power-generating modules within six months of receipt of the report and the recommendation of the relevant TSO in accordance with Article 38(4). The decision of the regulatory authority or, where applicable, the **Contracting Party** shall be published.

6. The relevant TSO shall take account of the legitimate expectations of power-generating facility owners as part of the assessment of the application of this Regulation to existing power-generating modules.

7. The relevant TSO may assess the application of some or all of the provisions of this Regulation to existing power-generating modules every three years in accordance with the criteria and process set out in paragraphs 3 to 5.

### **Article 5**

#### **Determination of significance**

1. The power-generating modules shall comply with the requirements on the basis of the voltage level of their connection point and their maximum capacity according to the categories set out in paragraph 2.

2. Power-generating modules within the following categories shall be considered as significant:

(a) connection point below 110 kV and maximum capacity of 0,8 kW or more (type A);

(b) connection point below 110 kV and maximum capacity at or above a threshold proposed by each relevant TSO in accordance with the procedure laid out in paragraph 3 (type B). This threshold shall not be above the limits for type B power-generating modules contained in Table 1;

(c) connection point below 110 kV and maximum capacity at or above a threshold specified by each relevant TSO in accordance with paragraph 3 (type C). This threshold shall not be above the limits for type C power-generating modules contained in Table 1; or

(d) connection point at 110 kV or above (type D). A power-generating module is also of type D if its connection point is below 110 kV and its maximum capacity is at or above a threshold specified in accordance with paragraph 3. This threshold shall not be above the limit for type D power-generating modules contained in Table 1.

Table 1

**Limits for thresholds for type B, C and D power-generating modules**

<b>Synchronous areas</b>	<b>Limit for maximum capacity threshold from which a power-generating module is of type B</b>	<b>Limit for maximum capacity threshold from which a power-generating module is of type C</b>	<b>Limit for maximum capacity threshold from which a power-generating module is of type D</b>
Continental Europe, <b>Ukraine</b>	1 MW	50 MW	75 MW
Great Britain	1 MW	50 MW	75 MW
Nordic, <b>Georgia</b>	1,5 MW	10 MW	30 MW
Ireland and Northern Ireland	0,1 MW	5 MW	10 MW
Baltic, <b>Moldova</b>	0,5 MW	10 MW	15 MW

3. Proposals for maximum capacity thresholds for types B, C and D power-generating modules shall be subject to approval by the relevant regulatory authority or, where applicable, the **Contracting Party**. In forming proposals the relevant TSO shall coordinate with adjacent TSOs and DSOs and shall conduct a public consultation in accordance with Article 10. A proposal by the relevant TSO to change the thresholds shall not be made sooner than three years after the previous proposal.
4. Power-generating facility owners shall assist this process and provide data as requested by the relevant TSO.
5. If, as a result of modification of the thresholds, a power-generating module qualifies under a different type, the procedure laid down in Article 4(3) concerning existing power-generating modules shall apply before compliance with the requirements for the new type is required.

**Article 6****Application to power-generating modules, pump-storage power-generating modules, combined heat and power facilities, and industrial sites**

1. Offshore power-generating modules connected to the interconnected system shall meet the requirements for onshore power-generating modules, unless the requirements are modified for this purpose by the relevant system operator or unless the connection of power park modules is via a high voltage direct current connection or via a network whose frequency is not synchronously coupled to that of the main interconnected system (such as via a back-to-back convertor scheme).
2. Pump-storage power-generating modules shall fulfil all the relevant requirements in both generating and pumping operation mode. Synchronous compensation operation of pump-storage power-generating modules shall not be limited in time by the technical design of power-generating modules. Pump-storage variable speed power-generating modules shall fulfil the requirements applicable to synchronous power-generating modules as well as those set out in point (b) of Article 20(2), if they

qualify as type B, C or D.

3. With respect to power-generating modules embedded in the networks of industrial sites, power-generating facility owners, system operators of industrial sites and relevant system operators whose network is connected to the network of an industrial site shall have the right to agree on conditions for disconnection of such power-generating modules together with critical loads, which secure production processes, from the relevant system operator's network. The exercise of this right shall be coordinated with the relevant TSO.

4. Except for requirements under paragraphs 2 and 4 of Article 13 or where otherwise stated in the national framework, requirements of this Regulation relating to the capability to maintain constant active power output or to modulate active power output shall not apply to power-generating modules of facilities for combined heat and power production embedded in the networks of industrial sites, where all of the following criteria are met:

(a) the primary purpose of those facilities is to produce heat for production processes of the industrial site concerned;

(b) heat and power-generating is inextricably interlinked, that is to say any change of heat generation results inadvertently in a change of active power-generating and *vice versa*;

(c) the power-generating modules are of type A, B, C or, in the case of the Nordic synchronous area, type D in accordance with points (a) to (c) of Article 5(2).

5. Combined heat and power-generating facilities shall be assessed on the basis of their electrical maximum capacity.

## **Article 7**

### **Regulatory aspects**

1. Requirements of general application to be established by relevant system operators or TSOs under this Regulation shall be subject to approval by the entity designated by the **Contracting Party** and be published. The designated entity shall be the regulatory authority unless otherwise provided by the **Contracting Party**.

2. For site specific requirements to be established by relevant system operators or TSOs under this Regulation, **Contracting Party** may require approval by a designated entity.

3. When applying this Regulation, **Contracting Parties**, competent entities and system operators shall:

(a) apply the principles of proportionality and non-discrimination;

(b) ensure transparency;

(c) apply the principle of optimisation between the highest overall efficiency and lowest total costs for all parties involved;

(d) respect the responsibility assigned to the relevant TSO in order to ensure system security, including as required by national legislation;

(e) consult with relevant DSOs and take account of potential impacts on their system;

(f) take into consideration agreed European standards and technical specifications.

4. The relevant system operator or TSO shall submit a proposal for requirements of general application, or the methodology used to calculate or establish them, for approval by the competent entity within two years of **expiry of the deadline for transposition** of this Regulation.
5. Where this Regulation requires the relevant system operator, relevant TSO, power-generating facility owner and/or the distribution system operator to seek agreement, they shall endeavour to do so within six months after a first proposal has been submitted by one party to the other parties. If no agreement has been found within this time frame, each party may request the relevant regulatory authority to issue a decision within six months.
6. Competent entities shall take decisions on proposals for requirements or methodologies within six months following the receipt of such proposals.
7. If the relevant system operator or TSO deems an amendment to requirements or methodologies as provided for and approved under paragraph 1 and 2 to be necessary, the requirements provided for in paragraphs 3 to 8 shall apply to the proposed amendment. System operators and TSOs proposing an amendment shall take into account the legitimate expectations, if any, of power-generating facility owners, equipment manufacturers and other stakeholders based on the initially specified or agreed requirements or methodologies.
8. Any party having a complaint against a relevant system operator or TSO in relation to that relevant system operator's or TSO's obligations under this Regulation may refer the complaint to the regulatory authority which, acting as dispute settlement authority, shall issue a decision within two months after receipt of the complaint. That period may be extended by two months where additional information is sought by the regulatory authority. That extended period may be further extended with the agreement of the complainant. The regulatory authority's decision shall have binding effect unless and until overruled on appeal.
9. Where the requirements under this Regulation are to be established by a relevant system operator that is not a TSO, **Contracting Parties** may provide that instead the TSO be responsible for establishing the relevant requirements.

### **Article 8**

#### **Multiple TSOs**

1. Where more than one TSO exists in a **Contracting Party**, this Regulation shall apply to all those TSOs.
2. **Contracting Parties** may, under the national regulatory regime, provide that the responsibility of a TSO to comply with one or some or all obligations under this Regulation is assigned to one or more specific TSOs.

### **Article 9**

#### **Recovery of costs**

1. The costs borne by system operators subject to network tariff regulation and stemming from the

obligations laid down in this Regulation shall be assessed by the relevant regulatory authorities. Costs assessed as reasonable, efficient and proportionate shall be recovered through network tariffs or other appropriate mechanisms.

2. If requested by the relevant regulatory authorities, system operators referred to in paragraph 1 shall, within three months of the request, provide the information necessary to facilitate assessment of the costs incurred.

### **Article 10**

#### **Public consultation**

1. Relevant system operators and relevant TSOs shall carry out consultation with stakeholders, including the competent authorities of each **Contracting Party**, on proposals to extend the applicability of this Regulation to existing power-generating modules in accordance with Article 4(3), for the proposal for thresholds in accordance with Article 5(3), and on the report prepared in accordance with Article 38(3) and the cost-benefit analysis undertaken in accordance with Article 63(2). The consultation shall last at least for a period of one month.

2. The relevant system operators or relevant TSOs shall duly take into account the views of the stakeholders resulting from the consultations prior to the submission of the draft proposal for thresholds, the report or cost benefit analysis for approval by the regulatory authority or, if applicable, the **Contracting Party**. In all cases, a sound justification for including or not the views of the stakeholders shall be provided and published in a timely manner before, or simultaneously with, the publication of the proposal.

### **Article 11**

#### **Stakeholder involvement**

The **Energy Community Regulatory Board**, in close cooperation with the European Network of Transmission System Operators for Electricity (ENTSO for Electricity), shall organise stakeholder involvement regarding the requirements for grid connection of power-generating facilities, and other aspects of the implementation of this Regulation. This shall include regular meetings with stakeholders to identify problems and propose improvements notably related to the requirements for grid connection of power-generating facilities.

### **Article 12**

#### **Confidentiality obligations**

1. Any confidential information received, exchanged or transmitted pursuant to this Regulation shall be subject to the conditions of professional secrecy laid down in paragraphs 2, 3 and 4.

2. The obligation of professional secrecy shall apply to any persons, regulatory authorities or entities

subject to the provisions of this Regulation.

3. Confidential information received by the persons, regulatory authorities or entities referred to in paragraph 2 in the course of their duties may not be divulged to any other person or authority, without prejudice to cases covered by national law, the other provisions of this Regulation or other relevant **Energy Community** law.

4. Without prejudice to cases covered by national or **Energy Community** law, regulatory authorities, entities or persons who receive confidential information pursuant to this Regulation may use it only for the purpose of carrying out their duties under this Regulation.

## TITLE II REQUIREMENTS

### CHAPTER 1 General requirements

#### *Article 13*

#### **General requirements for type A power-generating modules**

1. Type A power-generating modules shall fulfil the following requirements relating to frequency stability:

(a) With regard to frequency ranges:

(i) a power-generating module shall be capable of remaining connected to the network and operate within the frequency ranges and time periods specified in Table 2;

(ii) the relevant system operator, in coordination with the relevant TSO, and the power-generating facility owner may agree on wider frequency ranges, longer minimum times for operation or specific requirements for combined frequency and voltage deviations to ensure the best use of the technical capabilities of a power-generating module, if it is required to preserve or to restore system security;

(iii) the power-generating facility owner shall not unreasonably withhold consent to apply wider frequency ranges or longer minimum times for operation, taking account of their economic and technical feasibility.

(b) With regard to the rate of change of frequency withstand capability, a power-generating module shall be capable of staying connected to the network and operate at rates of change of frequency up to a value specified by the relevant TSO, unless disconnection was triggered by rate-of-change-of-frequency-type loss of mains protection. The relevant system operator, in coordination with the relevant TSO, shall specify this rate-of-change-of-frequency-type loss of mains protection.

Table 2

**Minimum time periods for which a power-generating module has to be capable of operating on different frequencies, deviating from a nominal value, without disconnecting from the network.**

<b>Synchronous area</b>	<b>Frequency range</b>	<b>Time period for operation</b>
Continental Europe	47,5 Hz-48,5 Hz	To be specified by each TSO, but not less than 30 minutes
	48,5 Hz-49,0 Hz	To be specified by each TSO, but not less than the period for 47,5 Hz-48,5 Hz
	49,0 Hz-51,0 Hz	Unlimited
	51,0 Hz-51,5 Hz	30 minutes
Nordic	47,5 Hz-48,5 Hz	30 minutes
	48,5 Hz-49,0 Hz	To be specified by each TSO, but not less than 30 minutes
	49,0 Hz-51,0 Hz	Unlimited
	51,0 Hz-51,5 Hz	30 minutes
Great Britain	47,0 Hz-47,5 Hz	20 seconds
	47,5 Hz-48,5 Hz	90 minutes
	48,5 Hz-49,0 Hz	To be specified by each TSO, but not less than 90 minutes
	49,0 Hz-51,0 Hz	Unlimited
	51,0 Hz-51,5 Hz	90 minutes
	51,5 Hz-52,0 Hz	15 minutes
Ireland and Northern Ireland	47,5 Hz-48,5 Hz	90 minutes
	48,5 Hz-49,0 Hz	To be specified by each TSO, but not less than 90 minutes
	49,0 Hz-51,0 Hz	Unlimited
	51,0 Hz-51,5 Hz	90 minutes
Baltic	47,5 Hz-48,5 Hz	To be specified by each TSO, but not less than 30 minutes
	48,5 Hz-49,0 Hz	To be specified by each TSO, but not less than the period for 47,5 Hz-48,5 Hz
	49,0 Hz-51,0 Hz	Unlimited
	51,0 Hz-51,5 Hz	To be specified by each TSO, but not less than 30 minutes
<b>Georgia</b>	<b>47,0 Hz-47,5 Hz</b>	<b>20 seconds</b>
	<b>47,5 Hz-48,5 Hz</b>	<b>30 minutes</b>
	<b>48,5 Hz-49,0 Hz</b>	<b>60 minutes</b>
	<b>49,0 Hz-51,0 Hz</b>	<b>Unlimited</b>
	<b>51,0 Hz-51,5 Hz</b>	<b>30 minutes</b>

2. With regard to the limited frequency sensitive mode — overfrequency (LFSM-O), the following shall apply, as determined by the relevant TSO for its control area in coordination with the TSOs of

the same synchronous area to ensure minimal impacts on neighbouring areas:

(a) the power-generating module shall be capable of activating the provision of active power frequency response according to figure 1 at a frequency threshold and droop settings specified by the relevant TSO;

(b) instead of the capability referred to in paragraph (a), the relevant TSO may choose to allow within its control area automatic disconnection and reconnection of power-generating modules of Type A at randomised frequencies, ideally uniformly distributed, above a frequency threshold, as determined by the relevant TSO where it is able to demonstrate to the relevant regulatory authority, and with the cooperation of power-generating facility owners, that this has a limited cross-border impact and maintains the same level of operational security in all system states;

(c) the frequency threshold shall be between 50,2 Hz and 50,5 Hz inclusive;

(d) the droop settings shall be between 2% and 12%;

(e) the power-generating module shall be capable of activating a power frequency response with an initial delay that is as short as possible. If that delay is greater than two seconds, the power-generating facility owner shall justify the delay, providing technical evidence to the relevant TSO;

(f) the relevant TSO may require that upon reaching minimum regulating level, the power-generating module be capable of either:

- (i) continuing operation at this level; or
- (ii) further decreasing active power output;

(g) the power-generating module shall be capable of operating stably during LFSM-O operation. When LFSM-O is active, the LFSM-O setpoint will prevail over any other active power setpoints.

Figure 1

### Active power frequency response capability of power-generating modules in LFSM-O

$P_{ref}$  is the reference active power to which  $\Delta P$  is related and may be specified differently for synchronous power-generating modules and power park modules.  $\Delta P$  is the change in active power output from the power-generating module.  $f_n$  is the nominal frequency (50 Hz) in the network and  $\Delta f$  is the frequency deviation in the network. At overfrequencies where  $\Delta f$  is above  $\Delta f_1$ , the power-generating module has to provide a negative active power output change according to the droop S2.

3. The power-generating module shall be capable of maintaining constant output at its target active power value regardless of changes in frequency, except where output follows the changes specified in the context of paragraphs 2 and 4 of this Article or points (c) and (d) of Article 15(2) as applicable.

4. The relevant TSO shall specify admissible active power reduction from maximum output with falling frequency in its control area as a rate of reduction falling within the boundaries, illustrated by the full lines in Figure 2:

(a) below 49 Hz falling by a reduction rate of 2% of the maximum capacity at 50 Hz per 1 Hz frequency drop;

(b) below 49,5 Hz falling by a reduction rate of 10% of the maximum capacity at 50 Hz per 1 Hz frequency drop.

5. The admissible active power reduction from maximum output shall:

(a) clearly specify the ambient conditions applicable;

(b) take account of the technical capabilities of power-generating modules.

Figure 2

Maximum power capability reduction with falling frequency

The diagram represents the boundaries in which the capability can be specified by the relevant TSO.

6. The power-generating module shall be equipped with a logic interface (input port) in order to cease active power output within five seconds following an instruction being received at the input port. The relevant system operator shall have the right to specify requirements for equipment to make this facility operable remotely.

7. The relevant TSO shall specify the conditions under which a power-generating module is capable of connecting automatically to the network. Those conditions shall include:

- (a) frequency ranges within which an automatic connection is admissible, and a corresponding delay time; and
- (b) maximum admissible gradient of increase in active power output.

Automatic connection is allowed unless specified otherwise by the relevant system operator in coordination with the relevant TSO.

#### **Article 14**

#### **General requirements for type B power-generating modules**

1. Type B power-generating modules shall fulfil the requirements set out in Article 13, except for Article 13(2)(b).

2. Type B power-generating modules shall fulfil the following requirements in relation to frequency stability:

- (a) to control active power output, the power-generating module shall be equipped with an interface (input port) in order to be able to reduce active power output following an instruction at the input port; and
- (b) the relevant system operator shall have the right to specify the requirements for further equipment to allow active power output to be remotely operated.

3. Type B power-generating modules shall fulfil the following requirements in relation to robustness:

(a) with regard to fault-ride-through capability of power-generating modules:

(i) each TSO shall specify a voltage-against-time-profile in line with Figure 3 at the connection point for fault conditions, which describes the conditions in which the power-generating module is capable of staying connected to the network and continuing to operate stably after the power system has been disturbed by secured faults on the transmission system;

(ii) the voltage-against-time-profile shall express a lower limit of the actual course of the phase-to-phase voltages on the network voltage level at the connection point during a symmetrical fault, as a function of time before, during and after the fault;

(iii) the lower limit referred to in point (ii) shall be specified by the relevant TSO using the parameters set out in Figure 3, and within the ranges set out in Tables 3.1 and 3.2;

(iv) each TSO shall specify and make publicly available the pre-fault and post-fault conditions for the fault-ride-through capability in terms of:

- the calculation of the pre-fault minimum short circuit capacity at the connection point,
- pre-fault active and reactive power operating point of the power-generating module at the connection point and voltage at the connection point, and
- calculation of the post-fault minimum short circuit capacity at the connection point;

(v) at the request of a power-generating facility owner, the relevant system operator shall provide the pre-fault and post-fault conditions to be considered for fault-ride-through capability as an

outcome of the calculations at the connection point as specified in point (iv) regarding:

- pre-fault minimum short circuit capacity at each connection point expressed in MVA,
- pre-fault operating point of the power-generating module expressed in active power output and reactive power output at the connection point and voltage at the connection point, and
- post-fault minimum short circuit capacity at each connection point expressed in MVA.

Alternatively, the relevant system operator may provide generic values derived from typical cases;

Figure 3

The diagram represents the lower limit of a voltage-against-time profile of the voltage at the connection point, expressed as the ratio of its actual value and its reference 1 pu value before, during and after a fault.  $U_{ret}$  is the retained voltage at the connection point during a fault,  $t_{clear}$  is the instant when the fault has been cleared.  $U_{rec1}$ ,  $U_{rec2}$ ,  $t_{rec1}$ ,  $t_{rec2}$  and  $t_{rec3}$  specify certain points of lower limits of voltage recovery after fault clearance.

Table 3.1

**Parameters for Figure 3 for fault-ride-through capability of synchronous power-generating modules**

Voltage parameters (pu)		Time parameters (seconds)	
$U_{ret}$ :	0,05-0,3	$t_{clear}$ :	0,14-0,15 (or 0,14-0,25 if system protection and secure operation so require)
$U_{clear}$ :	0,7-0,9	$t_{rec1}$ :	$t_{clear}$
$U_{rec1}$ :	$U_{clear}$	$t_{rec2}$ :	$t_{rec1}-0,7$
$U_{rec2}$ :	0,85-0,9 and $\geq U_{clear}$	$t_{rec3}$ :	$t_{rec2}-1,5$

Table 3.2

**Parameters for Figure 3 for fault-ride-through capability of power park modules**

Voltage parameters (pu)		Time parameters (seconds)	
$U_{ret}$	0,05-0,15	$t_{clear}$	0,14-0,15 (or 0,14-0,25 if system protection and secure operation so require)
$U_{clear}$	$U_{ret}$ -0,15	$t_{rec1}$	$t_{clear}$
$U_{rec1}$	$U_{clear}$	$t_{rec2}$	$t_{rec1}$
$U_{rec2}$	0,85	$t_{rec3}$	1,5-3,0

(vi) the power-generating module shall be capable of remaining connected to the network and continuing to operate stably when the actual course of the phase-to-phase voltages on the network voltage level at the connection point during a symmetrical fault, given the pre-fault and post-fault conditions in points (iv) and (v) of paragraph 3(a), remain above the lower limit specified in point (ii) of paragraph 3(a), unless the protection scheme for internal electrical faults requires the disconnection of the power-generating module from the network. The protection schemes and settings for internal electrical faults must not jeopardise fault-ride-through performance;

(vii) without prejudice to point (vi) of paragraph 3(a), undervoltage protection (either fault-ride-through capability or minimum voltage specified at the connection point voltage) shall be set by the power-generating facility owner according to the widest possible technical capability of the power-generating module, unless the relevant system operator requires narrower settings in accordance with point (b) of paragraph 5. The settings shall be justified by the power-generating facility owner in accordance with this principle;

(b) fault-ride-through capabilities in case of asymmetrical faults shall be specified by each TSO.

4. Type B power-generating modules shall fulfil the following requirements relating to system restoration:

(a) the relevant TSO shall specify the conditions under which a power-generating module is capable of reconnecting to the network after an incidental disconnection caused by a network disturbance; and

(b) installation of automatic reconnection systems shall be subject both to prior authorisation by the relevant system operator and to the reconnection conditions specified by the relevant TSO.

5. Type B power-generating modules shall fulfil the following general system management requirements:

(a) with regard to control schemes and settings:

(i) the schemes and settings of the different control devices of the power-generating module that are necessary for transmission system stability and for taking emergency action shall be coordinated and agreed between the relevant TSO, the relevant system operator and the power-generating facility owner;

(ii) any changes to the schemes and settings, mentioned in point (i), of the different control devices of the power-generating module shall be coordinated and agreed between the relevant TSO, the relevant system operator and the power-generating facility owner, in particular if they apply in the circumstances referred to in point (i) of paragraph 5(a);

(b) with regard to electrical protection schemes and settings:

(i) the relevant system operator shall specify the schemes and settings necessary to protect the network, taking into account the characteristics of the power-generating module. The protection schemes needed for the power-generating module and the network as well as the settings relevant to the power-generating module shall be coordinated and agreed between the relevant system operator and the power-generating facility owner. The protection schemes and settings for internal electrical faults must not jeopardise the performance of a power-generating module, in line with the requirements set out in this Regulation;

(ii) electrical protection of the power-generating module shall take precedence over operational controls, taking into account the security of the system and the health and safety of staff and of the public, as well as mitigating any damage to the power-generating module;

(iii) protection schemes may cover the following aspects:

- external and internal short circuit,
- asymmetric load (negative phase sequence),
- stator and rotor overload,
- over-/underexcitation,
- over-/undervoltage at the connection point,
- over-/undervoltage at the alternator terminals,
- inter-area oscillations,
- inrush current,
- asynchronous operation (pole slip),
- protection against inadmissible shaft torsions (for example, subsynchronous resonance),
- power-generating module line protection,
- unit transformer protection,
- back-up against protection and switchgear malfunction,
- overfluxing (U/f),
- inverse power,
- rate of change of frequency, and
- neutral voltage displacement.

(iv) changes to the protection schemes needed for the power-generating module and the network and to the settings relevant to the power-generating module shall be agreed between the system operator and the power-generating facility owner, and agreement shall be reached before any changes are made;

(c) the power-generating facility owner shall organise its protection and control devices in accordance with the following priority ranking (from highest to lowest):

- (i) network and power-generating module protection;
- (ii) synthetic inertia, if applicable;
- (iii) frequency control (active power adjustment);

- (iv) power restriction; and
- (v) power gradient constraint;
- (d) with regard to information exchange:
  - (i) power-generating facilities shall be capable of exchanging information with the relevant system operator or the relevant TSO in real time or periodically with time stamping, as specified by the relevant system operator or the relevant TSO;
  - (ii) the relevant system operator, in coordination with the relevant TSO, shall specify the content of information exchanges including a precise list of data to be provided by the power-generating facility.

### **Article 15**

#### **General requirements for type C power-generating modules**

1. Type C power-generating modules shall fulfil the requirements laid down in Articles 13 and 14, except for Article 13(2)(b) and (6) and Article 14(2).

2. Type C power-generating modules shall fulfil the following requirements relating to frequency stability:

(a) with regard to active power controllability and control range, the power-generating module control system shall be capable of adjusting an active power setpoint in line with instructions given to the power-generating facility owner by the relevant system operator or the relevant TSO.

The relevant system operator or the relevant TSO shall establish the period within which the adjusted active power setpoint must be reached. The relevant TSO shall specify a tolerance (subject to the availability of the prime mover resource) applying to the new setpoint and the time within which it must be reached;

(b) manual local measures shall be allowed in cases where the automatic remote control devices are out of service.

The relevant system operator or the relevant TSO shall notify the regulatory authority of the time required to reach the setpoint together with the tolerance for the active power;

(c) In addition to Article 13(2), the following requirements shall apply to type C power-generating modules with regard to limited frequency sensitive mode — underfrequency (LFSM-U):

(i) the power-generating module shall be capable of activating the provision of active power frequency response at a frequency threshold and with a droop specified by the relevant TSO in coordination with the TSOs of the same synchronous area as follows:

- the frequency threshold specified by the TSO shall be between 49,8 Hz and 49,5 Hz inclusive,
- the droop settings specified by the TSO shall be in the range 2-12%.

This is represented graphically in Figure 4;

(ii) the actual delivery of active power frequency response in LFSM-U mode shall take into account:

- ambient conditions when the response is to be triggered,

— the operating conditions of the power-generating module, in particular limitations on operation near maximum capacity at low frequencies and the respective impact of ambient conditions according to paragraphs 4 and 5 of Article 13, and

— the availability of the primary energy sources.

(iii) the activation of active power frequency response by the power-generating module shall not be unduly delayed. In the event of any delay greater than two seconds, the power-generating facility owner shall justify it to the relevant TSO;

(iv) in LFSM-U mode the power-generating module shall be capable of providing a power increase up to its maximum capacity;

(v) stable operation of the power-generating module during LFSM-U operation shall be ensured;

Figure 4

### Active power frequency response capability of power-generating modules in LFSM-U

$P_{ref}$  is the reference active power to which  $\Delta P$  is related and may be specified differently for synchronous power-generating modules and power park modules.  $\Delta P$  is the change in active power output from the power-generating module.  $f_n$  is the nominal frequency (50 Hz) in the network and  $\Delta f$  is the frequency deviation in the network. At underfrequencies where  $\Delta f$  is below  $\Delta f_1$  the power-generating module has to provide a positive active power output change according to the droop S2.

(d) in addition to point (c) of paragraph 2, the following shall apply cumulatively when frequency sensitive mode ('FSM') is operating:

(i) the power-generating module shall be capable of providing active power frequency response in accordance with the parameters specified by each relevant TSO within the ranges shown in Table 4. In specifying those parameters, the relevant TSO shall take account of the following facts:

— in case of overfrequency, the active power frequency response is limited by the minimum regulating level,

— in case of underfrequency, the active power frequency response is limited by maximum capacity,

— the actual delivery of active power frequency response depends on the operating and ambient conditions of the power-generating module when this response is triggered, in particular limita-

tions on operation near maximum capacity at low frequencies according to paragraphs 4 and 5 of Article 13 and available primary energy sources;

Table 4

**Parameters for active power frequency response in FSM (explanation for Figure 5)**

Parameters	Ranges	
Active power range related to maximum capacity $\frac{ \Delta P_1 }{P_{max}}$	1,5-10%	
Frequency response insensitivity	$ \Delta f_i $	10-30 mHz
	$\frac{ \Delta f_i }{f_n}$	0,02-0,06%
Frequency response deadband	0-500 mHz	
Droop $s_1$	2-12%	

Figure 5

**Active power frequency response capability of power-generating modules in FSM illustrating the case of zero deadband and insensitivity**

$P_{ref}$  is the reference active power to which  $\Delta P$  is related.  $\Delta P$  is the change in active power output from the power-generating module.  $f_n$  is the nominal frequency (50 Hz) in the network and  $\Delta f$  is the frequency deviation in the network.

(ii) the frequency response deadband of frequency deviation and droop must be able to be re-selected repeatedly;

(iii) in the event of a frequency step change, the power-generating module shall be capable of activating full active power frequency response, at or above the full line shown in Figure 6 in accordance with the parameters specified by each TSO (which shall aim at avoiding active power oscillations for the power-generating module) within the ranges given in Table 5. The combination of choice of the parameters specified by the TSO shall take possible technology-dependent limitations into account;

(iv) the initial activation of active power frequency response required shall not be unduly delayed. If the delay in initial activation of active power frequency response is greater than two seconds, the power-generating facility owner shall provide technical evidence demonstrating why a longer time is needed.

For power-generating modules without inertia, the relevant TSO may specify a shorter time than two seconds. If the power-generating facility owner cannot meet this requirement they shall provide technical evidence demonstrating why a longer time is needed for the initial activation of active power frequency response;

Figure 6  
Active power frequency response capability

$P_{\max}$  is the maximum capacity to which  $\Delta P$  relates.  $\Delta P$  is the change in active power output from the power-generating module. The power-generating module has to provide active power output  $\Delta P$  up to the point  $\Delta P_1$  in accordance with the times  $t_1$  and  $t_2$  with the values of  $\Delta P_1$ ,  $t_1$  and  $t_2$  being specified by the relevant TSO according to Table 5.  $t_1$  is the initial delay.  $t_2$  is the time for full activation.

(v) the power-generating module shall be capable of providing full active power frequency response for a period of between 15 and 30 minutes as specified by the relevant TSO. In specifying the period, the TSO shall have regard to active power headroom and primary energy source of

the power-generating module;

(vi) within the time limits laid down in point (v) of paragraph 2(d), active power control must not have any adverse impact on the active power frequency response of power-generating modules;

(vii) the parameters specified by the relevant TSO in accordance with points (i), (ii), (iii) and (v) shall be notified to the relevant regulatory authority. The modalities of that notification shall be specified in accordance with the applicable national regulatory framework;

Table 5

**Parameters for full activation of active power frequency response resulting from frequency step change (explanation for Figure 6)**

Parameters	Ranges or values
Active power range related to maximum capacity (frequency response range) $\frac{ \Delta P_1 }{P_{\max}}$	1,5-10%
For power-generating modules with inertia, the maximum admissible initial delay $t_1$ unless justified otherwise in line with Article 15(2)(d)(iv)	2 seconds
For power-generating modules without inertia, the maximum admissible initial delay $t_1$ unless justified otherwise in line with Article 15(2)(d)(iv)	as specified by the relevant TSO.
Maximum admissible choice of full activation time $t_2$ , unless longer activation times are allowed by the relevant TSO for reasons of system stability	30 seconds

(e) with regard to frequency restoration control, the power-generating module shall provide functionalities complying with specifications specified by the relevant TSO, aiming at restoring frequency to its nominal value or maintaining power exchange flows between control areas at their scheduled values;

(f) with regard to disconnection due to underfrequency, power-generating facilities capable of acting as a load, including hydro pump-storage power-generating facilities, shall be capable of disconnecting their load in case of underfrequency. The requirement referred to in this point does not extend to auxiliary supply;

(g) with regard to real-time monitoring of FSM:

(i) to monitor the operation of active power frequency response, the communication interface shall be equipped to transfer in real time and in a secured manner from the power-generating facility to the network control centre of the relevant system operator or the relevant TSO, at the request of the relevant system operator or the relevant TSO, at least the following signals:

- status signal of FSM (on/off),
- scheduled active power output,
- actual value of the active power output,
- actual parameter settings for active power frequency response,

— droop and deadband;

(ii) the relevant system operator and the relevant TSO shall specify additional signals to be provided by the power-generating facility by monitoring and recording devices in order to verify the performance of the active power frequency response provision of participating power-generating modules.

3. With regard to voltage stability, type C power-generating modules shall be capable of automatic disconnection when voltage at the connection point reaches levels specified by the relevant system operator in coordination with the relevant TSO.

The terms and settings for actual automatic disconnection of power-generating modules shall be specified by the relevant system operator in coordination with the relevant TSO.

4. Type C power-generating modules shall fulfil the following requirements relating to robustness:

(a) in the event of power oscillations, power-generating modules shall retain steady-state stability when operating at any operating point of the P-Q-capability diagram;

(b) without prejudice to paragraph 4 and 5 of Article 13, power-generating modules shall be capable of remaining connected to the network and operating without power reduction, as long as voltage and frequency remain within the specified limits pursuant to this Regulation;

(c) power-generating modules shall be capable of remaining connected to the network during single-phase or three-phase auto-reclosures on meshed network lines, if applicable to the network to which they are connected. The details of that capability shall be subject to coordination and agreements on protection schemes and settings as referred to in point (b) of Article 14(5).

5. Type C power-generating modules shall fulfil the following requirements relating to system restoration:

(a) with regard to black start capability:

(i) black start capability is not mandatory without prejudice to the **Contracting Party's** rights to introduce obligatory rules in order to ensure system security;

(ii) power-generating facility owners shall, at the request of the relevant TSO, provide a quotation for providing black start capability. The relevant TSO may make such a request if it considers system security to be at risk due to a lack of black start capability in its control area;

(iii) a power-generating module with black start capability shall be capable of starting from shutdown without any external electrical energy supply within a time frame specified by the relevant system operator in coordination with the relevant TSO;

(iv) a power-generating module with black start capability shall be able to synchronise within the frequency limits laid down in point (a) of Article 13(1) and, where applicable, voltage limits specified by the relevant system operator or in Article 16(2);

(v) a power-generating module with black start capability shall be capable of automatically regulating dips in voltage caused by connection of demand;

(vi) a power-generating module with black start capability shall:

— be capable of regulating load connections in block load,

— be capable of operating in LFSM-O and LFSM-U, as specified in point (c) of paragraph 2 and Article 13(2),

- control frequency in case of overfrequency and underfrequency within the whole active power output range between minimum regulating level and maximum capacity as well as at houseload level,
- be capable of parallel operation of a few power-generating modules within one island, and
- control voltage automatically during the system restoration phase;

(b) with regard to the capability to take part in island operation:

(i) power-generating modules shall be capable of taking part in island operation if required by the relevant system operator in coordination with the relevant TSO and:

- the frequency limits for island operation shall be those established in accordance with point (a) of Article 13(1),
- the voltage limits for island operation shall be those established in accordance with Article 15(3) or Article 16(2), where applicable;

(ii) power-generating modules shall be able to operate in FSM during island operation, as specified in point (d) of paragraph 2.

In the event of a power surplus, power-generating modules shall be capable of reducing the active power output from a previous operating point to any new operating point within the P-Q-capability diagram. In that regard, the power-generating module shall be capable of reducing active power output as much as inherently technically feasible, but to at least 55% of its maximum capacity;

(iii) the method for detecting a change from interconnected system operation to island operation shall be agreed between the power-generating facility owner and the relevant system operator in coordination with the relevant TSO. The agreed method of detection must not rely solely on the system operator's switchgear position signals;

(iv) power-generating modules shall be able to operate in LFSM-O and LFSM-U during island operation, as specified in point (c) of paragraph 2 and Article 13(2);

(c) with regard to quick re-synchronisation capability:

(i) in case of disconnection of the power-generating module from the network, the power-generating module shall be capable of quick re-synchronisation in line with the protection strategy agreed between the relevant system operator in coordination with the relevant TSO and the power-generating facility;

(ii) a power-generating module with a minimum re-synchronisation time greater than 15 minutes after its disconnection from any external power supply must be designed to trip to houseload from any operating point in its P-Q-capability diagram. In this case, the identification of houseload operation must not be based solely on the system operator's switchgear position signals;

(iii) power-generating modules shall be capable of continuing operation following tripping to houseload, irrespective of any auxiliary connection to the external network. The minimum operation time shall be specified by the relevant system operator in coordination with the relevant TSO, taking into consideration the specific characteristics of prime mover technology.

6. Type C power-generating modules shall fulfil the following general system management requirements:

(a) with regard to loss of angular stability or loss of control, a power-generating module shall be

capable of disconnecting automatically from the network in order to help preserve system security or to prevent damage to the power-generating module. The power-generating facility owner and the relevant system operator in coordination with the relevant TSO shall agree on the criteria for detecting loss of angular stability or loss of control;

(b) with regard to instrumentation:

(i) power-generating facilities shall be equipped with a facility to provide fault recording and monitoring of dynamic system behaviour. This facility shall record the following parameters:

- voltage,
- active power,
- reactive power, and
- frequency.

The relevant system operator shall have the right to specify quality of supply parameters to be complied with on condition that reasonable prior notice is given;

(ii) the settings of the fault recording equipment, including triggering criteria and the sampling rates shall be agreed between the power-generating facility owner and the relevant system operator in coordination with the relevant TSO;

(iii) the dynamic system behaviour monitoring shall include an oscillation trigger specified by the relevant system operator in coordination with the relevant TSO, with the purpose of detecting poorly damped power oscillations;

(iv) the facilities for quality of supply and dynamic system behaviour monitoring shall include arrangements for the power-generating facility owner, and the relevant system operator and the relevant TSO to access the information. The communications protocols for recorded data shall be agreed between the power-generating facility owner, the relevant system operator and the relevant TSO;

(c) with regard to the simulation models:

(i) at the request of the relevant system operator or the relevant TSO, the power-generating facility owner shall provide simulation models which properly reflect the behaviour of the power-generating module in both steady-state and dynamic simulations (50 Hz component) or in electromagnetic transient simulations.

The power-generating facility owner shall ensure that the models provided have been verified against the results of compliance tests referred to in Chapters 2, 3 and 4 of Title IV, and shall notify the results of the verification to the relevant system operator or relevant TSO. **Contracting Parties** may require that such verification be carried out by an authorised certifier;

(ii) the models provided by the power-generating facility owner shall contain the following sub-models, depending on the existence of the individual components:

- alternator and prime mover,
- speed and power control,
- voltage control, including, if applicable, power system stabiliser ('PSS') function and excitation control system,

— power-generating module protection models, as agreed between the relevant system operator and the power-generating facility owner, and

— converter models for power park modules;

(iii) the request by the relevant system operator referred to in point (i) shall be coordinated with the relevant TSO. It shall include:

— the format in which models are to be provided,

— the provision of documentation on a model's structure and block diagrams,

— an estimate of the minimum and maximum short circuit capacity at the connection point, expressed in MVA, as an equivalent of the network;

(iv) the power-generating facility owner shall provide recordings of the power-generating module's performance to the relevant system operator or relevant TSO if requested. The relevant system operator or relevant TSO may make such a request, in order to compare the response of the models with those recordings;

(d) with regard to the installation of devices for system operation and devices for system security, if the relevant system operator or the relevant TSO considers that it is necessary to install additional devices in a power-generating facility in order to preserve or restore system operation or security, the relevant system operator or relevant TSO and the power-generating facility owner shall investigate that matter and agree on an appropriate solution;

(e) the relevant system operator shall specify, in coordination with the relevant TSO, minimum and maximum limits on rates of change of active power output (ramping limits) in both an up and down direction of change of active power output for a power-generating module, taking into consideration the specific characteristics of prime mover technology;

(f) earthing arrangement of the neutral-point at the network side of step-up transformers shall comply with the specifications of the relevant system operator.

## **Article 16**

### **General requirements for type D power-generating modules**

1. In addition to fulfilling the requirements listed in Article 13, except for Article 13(2)(b), (6) and (7), Article 14, except for Article 14(2), and Article 15, except for Article 15(3), type D power-generating modules shall fulfil the requirements set out in this Article.

2. Type D power-generating modules shall fulfil the following requirements relating to voltage stability:

(a) with regard to voltage ranges:

(i) without prejudice to point (a) of Article 14(3) and point (a) of paragraph 3 below, a power-generating module shall be capable of staying connected to the network and operating within the ranges of the network voltage at the connection point, expressed by the voltage at the connection point related to the reference 1 pu voltage, and for the time periods specified in Tables 6.1 and 6.2;

(ii) the relevant TSO may specify shorter periods of time during which power-generating modules shall be capable of remaining connected to the network in the event of simultaneous overvoltage

and underfrequency or simultaneous undervoltage and overfrequency;

(iii) notwithstanding the provisions of point (i), the relevant TSO in Spain may require power-generating modules to be capable of remaining connected to the network in the voltage range between 1,05 pu and 1,0875 pu for an unlimited period;

(iv) for the 400 kV grid voltage level (or alternatively commonly referred to as 380 kV level), the reference 1 pu value is 400 kV; for other grid voltage levels, the reference 1 pu voltage may differ for each system operator in the same synchronous area;

(v) notwithstanding the provisions of point (i), the relevant TSOs in the Baltic synchronous area may require power-generating modules to remain connected to the 400 kV network in the voltage range limits and for the time periods that apply in the Continental Europe synchronous area;

Table 6.1

Synchronous area	Voltage range	Time period for operation
Continental Europe	0,85 pu-0,90 pu	60 minutes
	0,90 pu-1,118 pu	Unlimited
	1,118 pu-1,15 pu	To be specified by each TSO, but not less than 20 minutes and not more than 60 minutes
Nordic	0,90 pu-1,05 pu	Unlimited
	1,05 pu-1,10 pu	60 minutes
Great Britain	0,90 pu-1,10 pu	Unlimited
Ireland and Northern Ireland	0,90 pu-1,118 pu	Unlimited
Baltic	0,85 pu-0,90 pu	30 minutes
	0,90 pu-1,118 pu	Unlimited
	1,118 pu-1,15 pu	20 minutes
<b>Georgia</b>	<b>0,85 pu-0,90 pu</b>	<b>60 minutes</b>
	<b>0,90 pu-1,12 pu</b>	<b>Unlimited</b>
	<b>1,12 pu-1,15 pu</b>	<b>20 minutes</b>

The table shows the minimum time periods during which a power-generating module must be capable of operating for voltages deviating from the reference 1 pu value at the connection point without disconnecting from the network, where the voltage base for pu values is from 110 kV to 300 kV.

Table 6.2

Synchronous area	Voltage range	Time period for operation
Continental Europe	0,85 pu-0,90 pu	60 minutes
	0,90 pu-1,05 pu	Unlimited
	1,05 pu-1,10 pu	To be specified by each TSO, but not less than 20 minutes and not more than 60 minutes

Nordic	0,90 pu-1,05 pu	Unlimited
	1,05 pu-1,10 pu	To be specified by each TSO, but not more than 60 minutes
Great Britain	0,90 pu-1,05 pu	Unlimited
	1,05 pu-1,10 pu	15 minutes
Ireland and Northern Ireland	0,90 pu-1,05 pu	Unlimited
Baltic	0,88 pu-0,90 pu	20 minutes
	0,90 pu-1,097 pu	Unlimited
	1,097 pu-1,15 pu	20 minutes
<b>Georgia</b>	<b>0,85 pu-0,90 pu</b>	<b>60 minutes</b>
	<b>0,90 pu-1,10 pu</b>	<b>Unlimited</b>
	<b>1,10 pu-1,15 pu</b>	<b>20 minutes</b>

The table shows the minimum time periods during which a power-generating module must be capable of operating for voltages deviating from the reference 1 pu value at the connection point without disconnecting from the network where the voltage base for pu values is from 300 kV to 500 kV.

(b) wider voltage ranges or longer minimum time periods for operation may be agreed between the relevant system operator and the power-generating facility owner in coordination with the relevant TSO. If wider voltage ranges or longer minimum times for operation are economically and technically feasible, the power-generating facility owner shall not unreasonably withhold an agreement;

(c) without prejudice to point (a), the relevant system operator in coordination with the relevant TSO shall have the right to specify voltages at the connection point at which a power-generating module is capable of automatic disconnection. The terms and settings for automatic disconnection shall be agreed between the relevant system operator and the power-generating facility owner.

3. Type D power-generating modules shall fulfil the following requirements in relation to robustness:

(a) with regard to fault-ride-through capability:

(i) power-generating modules shall be capable of staying connected to the network and continuing to operate stably after the power system has been disturbed by secured faults. That capability shall be in accordance with a voltage-against-time profile at the connection point for fault conditions specified by the relevant TSO.

The voltage-against-time-profile shall express a lower limit of the actual course of the phase-to-phase voltages on the network voltage level at the connection point during a symmetrical fault, as a function of time before, during and after the fault.

That lower limit shall be specified by the relevant TSO, using the parameters set out in Figure 3 and within the ranges set out in Tables 7.1 and 7.2 for type D power-generating modules connected at or above the 110 kV level.

That lower limit shall also be specified by the relevant TSO, using parameters set out in Figure 3 and within the ranges set out in Tables 3.1 and 3.2 for type D power-generating modules connected below the 110 kV level;

(ii) each TSO shall specify the pre-fault and post-fault conditions for the fault-ride-through capability referred to in point (iv) of Article 14(3)(a). The specified pre-fault and post-fault conditions for the fault-ride-through capability shall be made publicly available;

Table 7.1

**Parameters for Figure 3 for fault-ride-through capability  
of synchronous power-generating modules**

Voltage parameters (pu)		Time parameters (seconds)	
$U_{ret}$	0	$t_{clear}$	0,14-0,15 (or 0,14-0,25 if system protection and secure operation so require)
$U_{clear}$	0,25	$t_{rec1}$	$t_{clear} - 0,45$
$U_{rec1}$	0,5-0,7	$t_{rec2}$	$t_{rec1} - 0,7$
$U_{rec2}$	0,85-0,9	$t_{rec3}$	$t_{rec2} - 1,5$

Table 7.2

**Parameters for Figure 3 for fault-ride-through capability of power park modules**

Voltage parameters (pu)		Time parameters (seconds)	
$U_{ret}$	0	$t_{clear}$	0,14-0,15 (or 0,14-0,25 if system protection and secure operation so require)
$U_{clear}$	$U_{ret}$	$t_{rec1}$	$t_{clear}$
$U_{rec1}$	$U_{clear}$	$t_{rec2}$	$t_{rec1}$
$U_{rec2}$	0,85	$t_{rec3}$	1,5-3,0

(b) at the request of a power-generating facility owner, the relevant system operator shall provide the pre-fault and post-fault conditions to be considered for fault-ride-through capability as an outcome of the calculations at the connection point as specified in point (iv) of Article 14(3)(a) regarding:

- (i) pre-fault minimum short circuit capacity at each connection point expressed in MVA;
- (ii) pre-fault operating point of the power-generating module expressed as active power output and reactive power output at the connection point and voltage at the connection point; and
- (iii) post-fault minimum short circuit capacity at each connection point expressed in MVA;

(c) fault-ride-through capabilities in case of asymmetrical faults shall be specified by each TSO.

4. Type D power-generating modules shall fulfil the following general system management requirements:

(a) with regard to synchronisation, when starting a power-generating module, synchronisation shall be performed by the power-generating facility owner only after authorisation by the relevant system operator;

(b) the power-generating module shall be equipped with the necessary synchronisation facilities;

(c) synchronisation of power-generating modules shall be possible at frequencies within the ranges

set out in Table 2;

(d) the relevant system operator and the power-generating facility owner shall agree on the settings of synchronisation devices to be concluded prior to operation of the power-generating module. This agreement shall cover:

- (i) voltage;
- (ii) frequency;
- (iii) phase angle range;
- (iv) phase sequence;
- (v) deviation of voltage and frequency.

## **CHAPTER 2**

### **Requirements for synchronous power-generating modules**

#### ***Article 17***

##### **Requirements for type B synchronous power-generating modules**

1. Type B synchronous power-generating modules shall fulfil the requirements listed in Articles 13, except for Article 13(2)(b), and 14.
2. Type B synchronous power-generating modules shall fulfil the following additional requirements relating to voltage stability:
  - (a) with regard to reactive power capability, the relevant system operator shall have the right to specify the capability of a synchronous power-generating module to provide reactive power;
  - (b) with regard to the voltage control system, a synchronous power-generating module shall be equipped with a permanent automatic excitation control system that can provide constant alternator terminal voltage at a selectable setpoint without instability over the entire operating range of the synchronous power-generating module.
3. With regard to robustness, type B synchronous power-generating modules shall be capable of providing post-fault active power recovery. The relevant TSO shall specify the magnitude and time for active power recovery.

#### ***Article 18***

##### **Requirements for type C synchronous power-generating modules**

1. Type C synchronous power-generating modules shall fulfil the requirements laid down in Articles 13, 14, 15 and 17, except for Article 13(2)(b) and 13(6), Article 14(2) and Article 17(2)(a).
2. Type C synchronous power-generating modules shall fulfil the following additional requirements in relation to voltage stability:
  - (a) with regard to reactive power capability, the relevant system operator may specify supplementary

reactive power to be provided if the connection point of a synchronous power-generating module is neither located at the high-voltage terminals of the step-up transformer to the voltage level of the connection point nor at the alternator terminals, if no step-up transformer exists. This supplementary reactive power shall compensate the reactive power demand of the high-voltage line or cable between the high-voltage terminals of the step-up transformer of the synchronous power-generating module or its alternator terminals, if no step-up transformer exists, and the connection point and shall be provided by the responsible owner of that line or cable;

(b) with regard to reactive power capability at maximum capacity:

(i) the relevant system operator in coordination with the relevant TSO shall specify the reactive power provision capability requirements in the context of varying voltage. For that purpose the relevant system operator shall specify a  $U/Q/P_{\max}$ -profile within the boundaries of which the synchronous power-generating module shall be capable of providing reactive power at its maximum capacity. The specified  $U/Q/P_{\max}$  profile may take any shape, having regard to the potential costs of delivering the capability to provide reactive power production at high voltages and reactive power consumption at low voltages;

(ii) the  $U/Q/P_{\max}$ -profile shall be specified by the relevant system operator in coordination with the relevant TSO, in conformity with the following principles:

— the  $U/Q/P_{\max}$ -profile shall not exceed the  $U/Q/P_{\max}$ -profile envelope, represented by the inner envelope in Figure 7,

— the dimensions of the  $U/Q/P_{\max}$ -profile envelope ( $Q/P_{\max}$  range and voltage range) shall be within the range specified for each synchronous area in Table 8, and

— the position of the  $U/Q/P_{\max}$ -profile envelope shall be within the limits of the fixed outer envelope in Figure 7;

Figure 7

### $U/Q/P_{\max}$ -profile of a synchronous power-generating module

The diagram represents boundaries of a  $U-Q/P_{\max}$ -profile by the voltage at the connection point, expressed by the ratio of its actual value and the reference 1 pu value, against the ratio of the reactive power (Q) and the maximum capacity ( $P_{\max}$ ). The position, size and shape of the inner envelope are indicative.

Table 8  
Parameters for the inner envelope in Figure 7

Synchronous area	Maximum range of $Q/P_{\max}$	Maximum range of wsteady-state voltage level in PU
Continental Europe	0,95	0,225
Nordic	0,95	0,150
Great Britain	0,95	0,225
Ireland and Northern Ireland	1,08	0,218
Baltic, <b>Georgia</b>	1,0	0,220

(iii) the reactive power provision capability requirement applies at the connection point. For profile shapes other than rectangular, the voltage range represents the highest and lowest values. The full reactive power range is therefore not expected to be available across the range of steady-state voltages;

(iv) the synchronous power-generating module shall be capable of moving to any operating point within its  $U-Q/P_{\max}$  profile in appropriate timescales to target values requested by the relevant system operator;

(c) with regard to reactive power capability below maximum capacity, when operating at an active power output below the maximum capacity ( $P < P_{\max}$ ), the synchronous power-generating modules shall be capable of operating at every possible operating point in the P-Q-capability diagram of the alternator of that synchronous power-generating module, at least down to minimum stable operating level. Even at reduced active power output, reactive power supply at the connection point shall correspond fully to the P-Q-capability diagram of the alternator of that synchronous power-generating module, taking the auxiliary supply power and the active and reactive power losses of the step-up transformer, if applicable, into account.

### Article 19

#### Requirements for type D synchronous power-generating modules

1. Type D synchronous power-generating modules shall fulfil the requirements laid down in Article 13, except for Article 13(2)(b), (6) and (7), Article 14 except for Article 14(2), Article 15, except for Article 15(3), Article 16, Article 17, except for Article 17(2) and Article 18.

2. Type D synchronous power-generating modules shall fulfil the following additional requirements in relation to voltage stability:

(a) the parameters and settings of the components of the voltage control system shall be agreed

between the power-generating facility owner and the relevant system operator, in coordination with the relevant TSO;

(b) the agreement referred to in subparagraph (a) shall cover the specifications and performance of an automatic voltage regulator ('AVR') with regard to steady-state voltage and transient voltage control and the specifications and performance of the excitation control system. The latter shall include:

- (i) bandwidth limitation of the output signal to ensure that the highest frequency of response cannot excite torsional oscillations on other power-generating modules connected to the network;
- (ii) an underexcitation limiter to prevent the AVR from reducing the alternator excitation to a level which would endanger synchronous stability;
- (iii) an overexcitation limiter to ensure that the alternator excitation is not limited to less than the maximum value that can be achieved whilst ensuring that the synchronous power-generating module is operating within its design limits;
- (iv) a stator current limiter; and
- (v) a PSS function to attenuate power oscillations, if the synchronous power-generating module size is above a value of maximum capacity specified by the relevant TSO.

3. The relevant TSO and the power-generating facility owner shall enter into an agreement regarding technical capabilities of the power-generating module to aid angular stability under fault conditions.

## CHAPTER 3

### Requirements for power park modules

#### *Article 20*

#### Requirements for type B power park modules

1. Type B power park modules shall fulfil the requirements laid down in Articles 13, except for Article 13(2)(b), and Article 14.

2. Type B power park modules shall fulfil the following additional requirements in relation to voltage stability:

(a) with regard to reactive power capability, the relevant system operator shall have the right to specify the capability of a power park module to provide reactive power;

(b) the relevant system operator in coordination with the relevant TSO shall have the right to specify that a power park module be capable of providing fast fault current at the connection point in case of symmetrical (3-phase) faults, under the following conditions:

- (i) the power park module shall be capable of activating the supply of fast fault current either by:
  - ensuring the supply of the fast fault current at the connection point, or
  - measuring voltage deviations at the terminals of the individual units of the power park module and providing a fast fault current at the terminals of these units;
- (ii) the relevant system operator in coordination with the relevant TSO shall specify:

- how and when a voltage deviation is to be determined as well as the end of the voltage deviation,
- the characteristics of the fast fault current, including the time domain for measuring the voltage deviation and fast fault current, for which current and voltage may be measured differently from the method specified in Article 2,
- the timing and accuracy of the fast fault current, which may include several stages during a fault and after its clearance;

(c) with regard to the supply of fast fault current in case of asymmetrical (1-phase or 2-phase) faults, the relevant system operator in coordination with the relevant TSO shall have the right to specify a requirement for asymmetrical current injection.

3. Type B power park modules shall fulfil the following additional requirements in relation to robustness:

(a) the relevant TSO shall specify the post-fault active power recovery that the power park module is capable of providing and shall specify:

- (i) when the post-fault active power recovery begins, based on a voltage criterion;
- (ii) a maximum allowed time for active power recovery; and
- (iii) a magnitude and accuracy for active power recovery;

(b) the specifications shall be in accordance with the following principles:

- (i) interdependency between fast fault current requirements according to points (b) and (c) of paragraph 2 and active power recovery;
- (ii) dependence between active power recovery times and duration of voltage deviations;
- (iii) a specified limit of the maximum allowed time for active power recovery;
- (iv) adequacy between the level of voltage recovery and the minimum magnitude for active power recovery; and
- (v) adequate damping of active power oscillations.

### **Article 21**

#### **Requirements for type C power park modules**

1. Type C power park modules shall fulfil the requirements listed in Articles 13, except for Article 13(2)(b) and (6), Article 14, except for Article 14(2), Article 15 and Article 20, except for Article 20(2)(a), unless referred to otherwise in point (v) of paragraph 3(d).

2. Type C power park modules shall fulfil the following additional requirements in relation to frequency stability:

- (a) the relevant TSO shall have the right to specify that power park modules be capable of providing synthetic inertia during very fast frequency deviations;
- (b) the operating principle of control systems installed to provide synthetic inertia and the associated performance parameters shall be specified by the relevant TSO.

3. Type C power park modules shall fulfil the following additional requirements in relation to voltage stability:

(a) with regard to reactive power capability, the relevant system operator may specify supplementary reactive power to be provided if the connection point of a power park module is neither located at the high-voltage terminals of the step-up transformer to the voltage level of the connection point nor at the convertor terminals, if no step-up transformer exists. This supplementary reactive power shall compensate the reactive power demand of the high-voltage line or cable between the high-voltage terminals of the step-up transformer of the power park module or its convertor terminals, if no step-up transformer exists, and the connection point and shall be provided by the responsible owner of that line or cable.

(b) with regard to reactive power capability at maximum capacity:

(i) the relevant system operator in coordination with the relevant TSO shall specify the reactive power provision capability requirements in the context of varying voltage. To that end, it shall specify a  $U-Q/P_{\max}$ -profile that may take any shape within the boundaries of which the power park module shall be capable of providing reactive power at its maximum capacity;

(ii) the  $U-Q/P_{\max}$ -profile shall be specified by each relevant system operator in coordination with the relevant TSO in conformity with the following principles:

— the  $U-Q/P_{\max}$ -profile shall not exceed the  $U-Q/P_{\max}$ -profile envelope, represented by the inner envelope in Figure 8,

— the dimensions of the  $U-Q/P_{\max}$ -profile envelope ( $Q/P_{\max}$  range and voltage range) shall be within the values specified for each synchronous area in Table 9,

— the position of the  $U-Q/P_{\max}$ -profile envelope shall be within the limits of the fixed outer envelope set out in Figure 8, and

— the specified  $U-Q/P_{\max}$  profile may take any shape, having regard to the potential costs of delivering the capability to provide reactive power production at high voltages and reactive power consumption at low voltages;

Figure 8

**U-Q/P<sub>max</sub>-profile of a power park module**

The diagram represents boundaries of a U-Q/P<sub>max</sub>-profile by the voltage at the connection point, expressed by the ratio of its actual value and its reference 1 pu value, against the ratio of the reactive power (Q) and the maximum capacity (P<sub>max</sub>). The position, size and shape of the inner envelope are indicative.

Table 9

**Parameters for the inner envelope in Figure 8**

<b>Synchronous area</b>	<b>Maximum range of Q/P<sub>max</sub></b>	<b>Maximum range of steady-state voltage level in PU</b>
Continental Europe	0,75	0,225
Nordic	0,95	0,150
Great Britain	0,66	0,225
Ireland and Northern Ireland	0,66	0,218
Baltic, <b>Georgia</b>	0,80	0,220

(iii) the reactive power provision capability requirement applies at the connection point. For profile shapes other than rectangular, the voltage range represents the highest and lowest values. The full reactive power range is therefore not expected to be available across the range of steady-state voltages;

(c) with regard to reactive power capability below maximum capacity:

(i) the relevant system operator in coordination with the relevant TSO shall specify the reactive

power provision capability requirements and shall specify a  $P$ - $Q/P_{\max}$ -profile that may take any shape within the boundaries of which the power park module shall be capable of providing reactive power below maximum capacity;

(ii) the  $P$ - $Q/P_{\max}$ -profile shall be specified by each relevant system operator in coordination with the relevant TSO, in conformity with the following principles:

— the  $P$ - $Q/P_{\max}$ -profile shall not exceed the  $P$ - $Q/P_{\max}$ -profile envelope, represented by the inner envelope in Figure 9,

— the  $Q/P_{\max}$  range of the  $P$ - $Q/P_{\max}$ -profile envelope is specified for each synchronous area in Table 9,

— the active power range of the  $P$ - $Q/P_{\max}$ -profile envelope at zero reactive power shall be 1 pu,

— the  $P$ - $Q/P_{\max}$ -profile can be of any shape and shall include conditions for reactive power capability at zero active power, and

— the position of the  $P$ - $Q/P_{\max}$ -profile envelope shall be within the limits of the fixed outer envelope set out in Figure 9;

(iii) when operating at an active power output below maximum capacity ( $P < P_{\max}$ ), the power park module shall be capable of providing reactive power at any operating point inside its  $P$ - $Q/P_{\max}$ -profile, if all units of that power park module which generate power are technically available that is to say they are not out of service due to maintenance or failure, otherwise there may be less reactive power capability, taking into consideration the technical availabilities;

Figure 9

### $P$ - $Q/P_{\max}$ -profile of a power park module

The diagram represents boundaries of a  $P$ - $Q/P_{\max}$ -profile at the connection point by the active power, expressed by the ratio of its actual value and the maximum capacity  $P_{\max}$ , against the ratio of the reactive power ( $Q$ ) and the maximum capacity ( $P_{\max}$ ). The position, size and shape of the inner envelope are indicative.

- (iv) the power park module shall be capable of moving to any operating point within its  $P$ - $Q/P_{\max}$  profile in appropriate timescales to target values requested by the relevant system operator;
- (d) with regard to reactive power control modes:
  - (i) the power park module shall be capable of providing reactive power automatically by either voltage control mode, reactive power control mode or power factor control mode;
  - (ii) for the purposes of voltage control mode, the power park module shall be capable of contributing to voltage control at the connection point by provision of reactive power exchange with the network with a setpoint voltage covering 0,95 to 1,05 pu in steps no greater than 0,01 pu, with a slope having a range of at least 2 to 7% in steps no greater than 0,5%. The reactive power output shall be zero when the grid voltage value at the connection point equals the voltage setpoint;
  - (iii) the setpoint may be operated with or without a deadband selectable in a range from zero to  $\pm 5\%$  of reference 1 pu network voltage in steps no greater than 0,5%;
  - (iv) following a step change in voltage, the power park module shall be capable of achieving 90% of the change in reactive power output within a time  $t_1$  to be specified by the relevant system operator in the range of 1 to 5 seconds, and must settle at the value specified by the slope within a time  $t_2$  to be specified by the relevant system operator in the range of 5 to 60 seconds, with a steady-state reactive tolerance no greater than 5% of the maximum reactive power. The relevant system operator shall specify the time specifications;
  - (v) for the purpose of reactive power control mode, the power park module shall be capable of setting the reactive power setpoint anywhere in the reactive power range, specified by point (a) of Article 20(2) and by points (a) and (b) of Article 21(3), with setting steps no greater than 5 MVar or 5% (whichever is smaller) of full reactive power, controlling the reactive power at the connection point to an accuracy within plus or minus 5 MVar or plus or minus 5% (whichever is smaller) of the full reactive power;
  - (vi) for the purpose of power factor control mode, the power park module shall be capable of controlling the power factor at the connection point within the required reactive power range, specified by the relevant system operator according to point (a) of Article 20(2) or specified by points (a) and (b) of Article 21(3), with a target power factor in steps no greater than 0,01. The relevant system operator shall specify the target power factor value, its tolerance and the period of time to achieve the target power factor following a sudden change of active power output. The tolerance of the target power factor shall be expressed through the tolerance of its corresponding reactive power. This reactive power tolerance shall be expressed by either an absolute value or by a percentage of the maximum reactive power of the power park module;
  - (vii) the relevant system operator, in coordination with the relevant TSO and with the power park module owner, shall specify which of the above three reactive power control mode options and associated setpoints is to apply, and what further equipment is needed to make the adjustment of the relevant setpoint operable remotely;
- (e) with regard to prioritising active or reactive power contribution, the relevant TSO shall specify whether active power contribution or reactive power contribution has priority during faults for which

fault-ride-through capability is required. If priority is given to active power contribution, this provision has to be established no later than 150 ms from the fault inception;

(f) with regard to power oscillations damping control, if specified by the relevant TSO a power park module shall be capable of contributing to damping power oscillations. The voltage and reactive power control characteristics of power park modules must not adversely affect the damping of power oscillations.

### **Article 22**

#### **Requirements for type D power park modules**

Type D power park modules shall fulfil the requirements listed in Articles 13, except for Article 13(2) (b), (6) and (7), Article 14, except for Article 14(2), Article 15, except for Article 15(3), Article 16, Article 20 except for Article 20(2)(a) and Article 21.

## **CHAPTER 4**

### **Requirements for offshore power park modules**

#### **Article 23**

##### **General provisions**

1. The requirements set out in this Chapter apply to the connection to the network of AC-connected power park modules located offshore. An AC-connected power park module located offshore which does not have an offshore connection point shall be considered as an onshore power park module and thus shall comply with the requirements governing power park modules situated onshore.

2. The offshore connection point of an AC-connected offshore power park module shall be specified by the relevant system operator.

3. AC-connected offshore power park modules within the scope of this Regulation shall be categorised in accordance with the following offshore grid connection system configurations:

(a) configuration 1: AC connection to a single onshore grid interconnection point whereby one or more offshore power park modules that are interconnected offshore to form an offshore AC system are connected to the onshore system;

(b) configuration 2: meshed AC connections whereby a number of offshore power park modules are interconnected offshore to form an offshore AC system and the offshore AC system is connected to the onshore system at two or more onshore grid interconnection points.

**Article 24****Frequency stability requirements applicable to AC-connected offshore power park modules**

The frequency stability requirements laid down respectively in Article 13(1) to (5), except for Article 13(2)(b), Article 15(2) and Article 21(2) shall apply to any AC-connected offshore power park module.

**Article 25****Voltage stability requirements applicable to AC-connected offshore power park modules**

1. Without prejudice to point (a) of Article 14(3) and point (a) of Article 16(3), an AC-connected offshore power park module shall be capable of staying connected to the network and operating within the ranges of the network voltage at the connection point, expressed by the voltage at the connection point related to reference 1 pu voltage, and for the time periods specified in Table 10.
2. Notwithstanding the provisions of paragraph 1, the relevant TSO in Spain may require AC-connected offshore power park modules to remain connected to the network in the voltage range between 1,05 pu and 1,0875 pu for an unlimited period.
3. Notwithstanding the provisions of paragraph 1, the relevant TSOs in the Baltic synchronous area may require AC-connected offshore power park modules to remain connected to the 400 kV network in the voltage range and for the time periods that apply to the Continental Europe synchronous area.

Table 10

<b>Synchronous area</b>	<b>Voltage range</b>	<b>Time period for operation</b>
Continental Europe	0,85 pu-0,90 pu	60 minutes
	0,9 pu-1,118 pu <sub>±</sub>	Unlimited
	1,118 pu-1,15 pu <sub>±</sub>	To be specified by each TSO, but not less than 20 minutes and not more than 60 minutes
	0,90 pu-1,05 pu <sub>±</sub>	Unlimited
	1,05 pu-1,10 pu <sub>±</sub>	To be specified by each TSO, but not less than 20 minutes and not more than 60 minutes
Nordic	0,90 pu-1,05 pu	Unlimited
	1,05 pu-1,10 pu <sub>±</sub>	60 minutes
	1,05 pu-1,10 pu <sub>±</sub>	To be specified by each TSO, but not more than 60 minutes
Great Britain	0,90 pu-1,10 pu <sub>±</sub>	Unlimited
	0,90 pu-1,05 pu <sub>±</sub>	Unlimited
	1,05 pu-1,10 pu	15 minutes

Ireland and Northern Ireland	0,90 pu-1,10 pu	Unlimited
Baltic	0,85 pu-0,90 pu	30 minutes
	0,90 pu-1,118 pu <sub>↓</sub>	Unlimited
	1,118 pu-1,15 pu	20 minutes
	0,88 pu-0,90 pu <sub>↓</sub>	20 minutes
	0,90 pu-1,097 pu	Unlimited
	1,097 pu-1,15 pu	20 minutes

The table shows the minimum period during which an AC-connected offshore power park module must be capable of operating over different voltage ranges deviating from the reference 1 pu value without disconnecting.

4. The voltage stability requirements specified respectively in points (b) and (c) of Article 20(2) as well as in Article 21(3) shall apply to any AC-connected offshore power park module.

5. The reactive power capability at maximum capacity specified in point (b) of Article 21(3) shall apply to AC-connected offshore power park modules, except for Table 9. Instead, the requirements of Table 11 shall apply.

Table 11

#### Parameters for Figure 8

Synchronous area	Maximum range of $Q/P_{\max}$	Maximum range of steady-state voltage level in PU
Continental Europe	0,75	0,225
Nordic	0,95	0,150
Great Britain	0 <sub>↓</sub> 0,33 <sub>↓</sub>	0,225
Ireland and Northern Ireland	0,66	0,218
Baltic	0,8	0,22

#### Article 26

##### Robustness requirements applicable to AC-connected offshore power park modules

1. The robustness requirements of power-generating modules laid down in Article 15(4) and Article 20(3) shall apply to AC-connected offshore power park modules.

2. The fault-ride-through capability requirements laid down in point (a) of Article 14(3) and point (a) of Article 16(3) shall apply to AC-connected offshore power park modules.

**Article 27****System restoration requirements applicable to AC-connected offshore power park modules**

The system restoration requirements laid down respectively in Article 14(4) and Article 15(5) shall apply to AC-connected offshore power park modules.

**Article 28****General system management requirements applicable to AC-connected offshore power park modules**

The general system management requirements laid down in Article 14(5), Article 15(6) and Article 16(4) shall apply to AC-connected offshore power park modules.

**TITLE III****OPERATIONAL NOTIFICATION PROCEDURE FOR CONNECTION****CHAPTER 1****Connection of new power-generating modules****Article 29****General provisions**

1. The power-generating facility owner shall demonstrate to the relevant system operator that it has complied with the requirements set out in Title II of this Regulation by completing successfully the operational notification procedure for connection of each power-generating module described in Articles 30 to 37.
2. The relevant system operator shall clarify and make publicly available the details of the operational notification procedure.

**Article 30****Operational notification of type A power-generating modules**

1. The operational notification procedure for connection of each new type A power-generating module shall consist of submitting an installation document. The power-generating facility owner shall ensure that the required information is filled in on an installation document obtained from the relevant system operator and is submitted to the system operator. Separate installation documents shall be provided for each power-generating module within the power-generating facility.

The relevant system operator shall ensure that the required information can be submitted by third parties on behalf of the power-generating facility owner.

2. The relevant system operator shall specify the content of the installation document, which shall have at least the following information:

- (a) the location at which the connection is made;
- (b) the date of the connection;
- (c) the maximum capacity of the installation in kW;
- (d) the type of primary energy source;
- (e) the classification of the power-generating module as an emerging technology according to Title VI of this Regulation;
- (f) reference to equipment certificates issued by an authorised certifier used for equipment that is in the site installation;
- (g) as regards equipment used, for which an equipment certificate has not been received, information shall be provided as directed by the relevant system operator; and
- (h) the contact details of the power-generating facility owner and the installer and their signatures.

3. The power-generating facility owner shall ensure that the relevant system operator or the competent authority of the **Contracting Party** is notified about the permanent decommissioning of a power-generating module in accordance with national legislation.

The relevant system operator shall ensure that such notification can be made by third parties, including aggregators.

### **Article 31**

#### **Operational notification of type B, C and D power-generating modules**

The operational notification procedure for connection of each new type B, C and D power-generating module shall allow the use of equipment certificates issued by an authorised certifier.

### **Article 32**

#### **Procedure for type B and C power-generating modules**

1. For the purpose of operational notification for connection of each new type B and C power-generating module, a power-generating module document ('PGMD') shall be provided by the power-generating facility owner to the relevant system operator and shall include a statement of compliance.

For each power-generating module within the power-generating facility, separate independent PGMDs shall be provided.

2. The format of the PGMD and the information to be given therein shall be specified by the relevant system operator. The relevant system operator shall have the right to request that the power-generating facility owner include the following in the PGMD:

- (a) evidence of an agreement on the protection and control settings relevant to the connection point between the relevant system operator and the power-generating facility owner;
  - (b) itemised statement of compliance;
  - (c) detailed technical data of the power-generating module with relevance to the grid connection as specified by the relevant system operator;
  - (d) equipment certificates issued by an authorised certifier in respect of power-generating modules, where these are relied upon as part of the evidence of compliance;
  - (e) for Type C power-generating modules, simulation models pursuant to point (c) of Article 15(6);
  - (f) compliance test reports demonstrating steady-state and dynamic performance as required by Chapters 2, 3 and 4 of Title IV, including use of actual measured values during testing, to the level of detail required by the relevant system operator; and
  - (g) studies demonstrating steady-state and dynamic performance as required by Chapters 5, 6 or 7 of Title IV, to the level of detail required by the relevant system operator.
3. The relevant system operator, on acceptance of a complete and adequate PGMD, shall issue a final operational notification to the power-generating facility owner.
  4. The power-generating facility owner shall notify the relevant system operator or the competent authority of the **Contracting Party** about the permanent decommissioning of a power-generating module in accordance with national legislation.
  5. Where applicable, the relevant system operator shall ensure that the commissioning and decommissioning of Type B and Type C power-generating modules can be notified electronically.
  6. **Contracting Parties** may provide that the PGMD shall be issued by an authorised certifier.

### **Article 33**

#### **Procedure for type D power-generating modules**

The operational notification procedure for connection of each new type D power-generating module shall comprise:

- (a) energisation operational notification ('EON');
- (b) interim operational notification ('ION'); and
- (c) final operational notification ('FON').

### **Article 34**

#### **Energisation operational notification for type D power-generating modules**

1. An EON shall entitle the power-generating facility owner to energise its internal network and auxiliaries for the power-generating modules by using the grid connection that is specified for the connection point.
2. An EON shall be issued by the relevant system operator, subject to completion of preparations

including agreement on the protection and control settings relevant to the connection point between the relevant system operator and the power-generating facility owner.

### **Article 35**

#### **Interim operational notification for type D power-generating modules**

1. An ION shall entitle the power-generating facility owner to operate the power-generating module and generate power by using the grid connection for a limited period of time.
2. An ION shall be issued by the relevant system operator, subject to completion of the data and study review process as required by this Article.
3. With regard to the data and study review, the relevant system operator shall have the right to request that the power-generating facility owner provide the following:
  - (a) itemised statement of compliance;
  - (b) detailed technical data on the power-generating module of relevance to the grid connection as specified by the relevant system operator;
  - (c) equipment certificates issued by an authorised certifier in respect of power-generating modules, where they are relied upon as part of the evidence of compliance;
  - (d) simulation models, as specified by point (c) of Article 15(6) and required by the relevant system operator;
  - (e) studies demonstrating the expected steady-state and dynamic performance as required by Chapter 5, 6 or 7 of Title IV; and
  - (f) details of intended compliance tests in accordance with Chapters 2, 3 and 4 of Title IV.
4. The maximum period during which the power-generating facility owner may maintain ION status shall be 24 months. The relevant system operator is entitled to specify a shorter ION validity period. An extension of the ION shall be granted only if the power-generating facility owner has made substantial progress towards full compliance. Outstanding issues shall be clearly identified at the time of requesting extension.
5. An extension of the period during which the power-generating facility owner may maintain ION status, beyond the period established in paragraph 4, may be granted if a request for a derogation is made to the relevant system operator before the expiry of that period in accordance with the derogation procedure laid down in Article 60.

### **Article 36**

#### **Final operational notification for type D power-generating modules**

1. A FON shall entitle the power-generating facility owner to operate a power-generating module by using the grid connection.
2. A FON shall be issued by the relevant system operator, upon prior removal of all incompatibilities identified for the purpose of ION status and subject to completion of the data and study review

process as required by this Article.

3. For the purposes of the data and study review, the power-generating facility owner must submit the following to the relevant system operator:

- (a) an itemised statement of compliance; and
- (b) an update of applicable technical data, simulation models and studies as referred to in points (b), (d) and (e) of Article 35(3), including the use of actual measured values during testing.

4. If incompatibility is identified in connection with the issuing of the FON, a derogation may be granted upon a request made to the relevant system operator, in accordance with the derogation procedure described in Title V. A FON shall be issued by the relevant system operator if the power-generating module complies with the provisions of the derogation.

Where a request for a derogation is rejected, the relevant system operator shall have the right to refuse to allow the operation of the power-generating module until the power-generating facility owner and the relevant system operator resolve the incompatibility and the relevant system operator considers that the power-generating module complies with the provisions of this Regulation.

If the relevant system operator and the power-generating facility owner do not resolve the incompatibility within a reasonable time frame, but in any case not later than six months after the notification of the rejection of the request for a derogation, each party may refer the issue for decision to the regulatory authority.

### **Article 37**

#### **Limited operational notification for type D power-generating modules**

1. Power-generating facility owners to whom a FON has been granted shall inform the relevant system operator immediately in the following circumstances:

- (a) the facility is temporarily subject to either significant modification or loss of capability affecting its performance; or
- (b) equipment failure leading to non-compliance with some relevant requirements.

2. The power-generating facility owner shall apply to the relevant system operator for a LON, if the power-generating facility owner reasonably expects the circumstances described in paragraph 1 to persist for more than three months.

3. A LON shall be issued by the relevant system operator and shall contain the following information which shall be clearly identifiable:

- (a) the unresolved issues justifying the granting of the LON;
- (b) the responsibilities and timescales for the expected solution; and
- (c) a maximum period of validity which shall not exceed 12 months. The initial period granted may be shorter with the possibility of an extension if evidence is submitted to the satisfaction of the relevant system operator demonstrating that substantial progress has been made towards achieving full compliance.

4. The FON shall be suspended during the period of validity of the LON with regard to the items for

which the LON has been issued.

5. A further extension of the period of validity of the LON may be granted upon a request for a derogation made to the relevant system operator before the expiry of that period, in accordance with the derogation procedure described in Title V.

6. The relevant system operator shall have the right to refuse to allow the operation of the power-generating module, once the LON is no longer valid. In such cases, the FON shall automatically become invalid.

7. If the relevant system operator does not grant an extension of the period of validity of the LON in accordance with paragraph 5 or if it refuses to allow the operation of the power-generating module once the LON is no longer valid in accordance with paragraph 6, the power-generating facility owner may refer the issue for decision to the regulatory authority within six months after the notification of the decision of the relevant system operator.

## CHAPTER 2

### Cost-benefit analysis

#### *Article 38*

#### **Identification of costs and benefits of application of requirements to existing power-generating modules**

1. Prior to the application of any requirement set out in this Regulation to existing power-generating modules in accordance with Article 4(3), the relevant TSO shall undertake a qualitative comparison of costs and benefits related to the requirement under consideration. This comparison shall take into account available network-based or market-based alternatives. The relevant TSO may only proceed to undertake a quantitative cost-benefit analysis in accordance with paragraphs 2 to 5, if the qualitative comparison indicates that the likely benefits exceed the likely costs. If, however, the cost is deemed high or the benefit is deemed low, then the relevant TSO shall not proceed further.

2. Following a preparatory stage undertaken in accordance with paragraph 1, the relevant TSO shall carry out a quantitative cost-benefit analysis of any requirement under consideration for application to existing power-generating modules that have demonstrated potential benefits as a result of the preparatory stage according to paragraph 1.

3. Within three months of concluding the cost-benefit analysis, the relevant TSO shall summarise the findings in a report which shall:

- (a) include the cost-benefit analysis and a recommendation on how to proceed;
- (b) include a proposal for a transitional period for applying the requirement to existing power-generating modules. That transitional period shall not be more than two years from the date of the decision of the regulatory authority or where applicable the **Contracting Party** on the requirement's applicability;
- (c) be subject to public consultation in accordance with Article 10.

4. No later than six months after the end of the public consultation, the relevant TSO shall prepare a report explaining the outcome of the consultation and making a proposal on the applicability of the

requirement under consideration to existing power-generating modules. The report and proposal shall be notified to the regulatory authority or, where applicable, the **Contracting Party**, and the power-generating facility owner or, where applicable, third party shall be informed on its content.

5. The proposal made by the relevant TSO to the regulatory authority or, where applicable, the **Contracting Party** pursuant to paragraph 4 shall include the following:

- (a) an operational notification procedure for demonstrating the implementation of the requirements by the existing power-generating facility owner;
- (b) a transitional period for implementing the requirements which shall take into account the category of the power-generating module as specified in Article 5(2) and Article 23(3) and any underlying obstacles to the efficient implementation of the equipment modification/refitting.

### **Article 39**

#### **Principles of cost-benefit analysis**

1. Power-generating facility owners and DSOs including CDSOs shall assist and contribute to the cost-benefit analysis undertaken according to Articles 38 and 63 and provide the necessary data as requested by the relevant system operator or relevant TSO within three months of receiving a request, unless agreed otherwise by the relevant TSO. For the preparation of a cost-benefit-analysis by a power-generating facility owner, or prospective owner, assessing a potential derogation pursuant to Article 62, the relevant TSO and DSO, including CDSO, shall assist and contribute to the cost-benefit analysis and provide the necessary data as requested by the power-generating facility owner, or the prospective owner, within three months of receiving a request, unless agreed otherwise by the power-generating facility owner or the prospective owner.

2. A cost-benefit analysis shall be in line with the following principles:

(a) the relevant TSO, relevant system operator, power-generating facility owner or prospective owner shall base its cost-benefit analysis on one or more of the following calculating principles:

- (i) the net present value;
- (ii) the return on investment;
- (iii) the rate of return;
- (iv) the time needed to break even;

(b) the relevant TSO, relevant system operator, power-generating facility owner or prospective owner shall also quantify socioeconomic benefits in terms of improvement in security of supply and shall include at least:

- (i) the associated reduction in probability of loss of supply over the lifetime of the modification;
- (ii) the probable extent and duration of such loss of supply;
- (iii) the societal cost per hour of such loss of supply;

(c) the relevant TSO, relevant system operator, power-generating facility owner or prospective owner shall quantify the benefits to the internal market in electricity, cross-border trade and integration of renewable energies, including at least:

- (i) the active power frequency response;
  - (ii) the balancing reserves;
  - (iii) the reactive power provision;
  - (iv) congestion management;
  - (v) defence measures;
- (d) the relevant TSO shall quantify the costs of applying the necessary rules to existing power-generating modules, including at least:
- (i) the direct costs incurred in implementing a requirement;
  - (ii) the costs associated with attributable loss of opportunity;
  - (iii) the costs associated with resulting changes in maintenance and operation.

## **TITLE IV COMPLIANCE**

### **CHAPTER 1 Compliance monitoring**

#### ***Article 40***

#### **Responsibility of the power-generating facility owner**

1. The power-generating facility owner shall ensure that each power-generating module complies with the requirements applicable under this Regulation throughout the lifetime of the facility. For type A power-generating modules, the power-generating facility owner may rely upon equipment certificates <...>
2. The power-generating facility owner shall notify to the relevant system operator any planned modification of the technical capabilities of a power-generating module which may affect its compliance with the requirements applicable under this Regulation, before initiating that modification.
3. The power-generating facility owner shall notify the relevant system operator of any operational incidents or failures of a power-generating module that affect its compliance with the requirements of this Regulation, without undue delay, after the occurrence of those incidents.
4. The power-generating facility owner shall notify the relevant system operator of the planned test schedules and procedures to be followed for verifying the compliance of a power-generating module with the requirements of this Regulation, in due time and prior to their launch. The relevant system operator shall approve in advance the planned test schedules and procedures. Such approval by the relevant system operator shall be provided in a timely manner and shall not be unreasonably withheld.
5. The relevant system operator may participate in such tests and record the performance of the power-generating modules.

## **Article 41**

### **Tasks of the relevant system operator**

1. The relevant system operator shall assess the compliance of a power-generating module with the requirements applicable under this Regulation, throughout the lifetime of the power-generating facility. The power-generating facility owner shall be informed of the outcome of this assessment.

For type A power-generating modules, the relevant system operator may rely upon equipment certificates issued by an authorised certifier for this assessment.

2. The relevant system operator shall have the right to request that the power-generating facility owner carry out compliance tests and simulations according to a repeat plan or general scheme or after any failure, modification or replacement of any equipment that may have an impact on the power-generating module's compliance with the requirements of this Regulation.

The power-generating facility owner shall be informed of the outcome of those compliance tests and simulations.

3. The relevant system operator shall make publicly available a list of information and documents to be provided as well as the requirements to be fulfilled by the power-generating facility owner within the framework of the compliance process. The list shall cover at least the following information, documents and requirements:

- (a) all the documentation and certificates to be provided by the power-generating facility owner;
- (b) details of the technical data on the power-generating module of relevance to the grid connection;
- (c) requirements for models for steady-state and dynamic system studies;
- (d) timeline for the provision of system data required to perform the studies;
- (e) studies by the power-generating facility owner to demonstrate the expected steady-state and dynamic performance in accordance with the requirements set out in Chapters 5 and 6 of Title IV;
- (f) conditions and procedures, including the scope, for registering equipment certificates; and
- (g) conditions and procedures for the use of relevant equipment certificates issued by an authorised certifier by the power-generating facility owner.

4. The relevant system operator shall make public the allocation of responsibilities between the power-generating facility owner and the system operator for compliance testing, simulation and monitoring.

5. The relevant system operator may totally or partially delegate the performance of its compliance monitoring to third parties. In such cases, the relevant system operator shall continue ensuring compliance with Article 12, including entering into confidentiality commitments with the assignee.

6. If compliance tests or simulations cannot be carried out as agreed between the relevant system operator and the power-generating facility owner due to reasons attributable to the relevant system operator, then the relevant system operator shall not unreasonably withhold the operational notification referred to in Title III.

## **Article 42**

### **Common provisions for compliance testing**

1. Testing of the performance of individual power-generating modules within a power-generating facility shall aim at demonstrating that the requirements of this Regulation have been complied with.
2. Notwithstanding the minimum requirements for compliance testing set out in this Regulation, the relevant system operator is entitled to:
  - (a) allow the power-generating facility owner to carry out an alternative set of tests, provided that those tests are efficient and suffice to demonstrate that a power-generating module complies with the requirements of this Regulation;
  - (b) require the power-generating facility owner to carry out additional or alternative sets of tests in those cases where the information supplied to the relevant system operator in relation to compliance testing under the provisions of Chapter 2, 3 or 4 of Title IV, is not sufficient to demonstrate compliance with the requirements of this Regulation; and
  - (c) require the power-generating facility owner to carry out appropriate tests in order to demonstrate a power-generating module's performance when operating on alternative fuels or fuel mixes. The relevant system operator and the power-generating facility owner shall agree on which types of fuel are to be tested.
3. The power-generating facility owner is responsible for carrying out the tests in accordance with the conditions laid down in Chapters 2, 3 and 4 of Title IV. The relevant system operator shall cooperate and not unduly delay the performance of the tests.
4. The relevant system operator may participate in the compliance testing either on site or remotely from the system operator's control centre. For that purpose, the power-generating facility owner shall provide the monitoring equipment necessary to record all relevant test signals and measurements as well as ensure that the necessary representatives of the power-generating facility owner are available on site for the entire testing period. Signals specified by the relevant system operator shall be provided if, for selected tests, the system operator wishes to use its own equipment to record performance. The relevant system operator has sole discretion to decide about its participation.

## **Article 43**

### **Common provisions on compliance simulation**

1. Simulation of the performance of individual power-generating modules within a power-generating facility shall aim at demonstrating that the requirements of this Regulation have been fulfilled.
2. Notwithstanding the minimum requirements set out in this Regulation for compliance simulation, the relevant system operator may:
  - (a) allow the power-generating facility owner to carry out an alternative set of simulations, provided that those simulations are efficient and suffice to demonstrate that a power-generating module complies with the requirements of this Regulation or with national legislation; and
  - (b) require the power-generating facility owner to carry out additional or alternative sets of simulations

in those cases where the information supplied to the relevant system operator in relation to compliance simulation under the provisions of Chapter 5, 6 or 7 of Title IV, is not sufficient to demonstrate compliance with the requirements of this Regulation.

3. To demonstrate compliance with the requirements of this Regulation, the power-generating facility owner shall provide a report with the simulation results for each individual power-generating module within the power-generating facility. The power-generating facility owner shall produce and provide a validated simulation model for a given power-generating module. The scope of the simulation models is set out in point (c) of Article 15(6).

4. The relevant system operator shall have the right to check that a power-generating module complies with the requirements of this Regulation by carrying out its own compliance simulations based on the provided simulation reports, simulation models and compliance test measurements.

5. The relevant system operator shall provide the power-generating facility owner with technical data and a simulation model of the network, to the extent necessary to carry out the requested simulations in accordance with Chapter 5, 6 or 7 of Title IV.

## CHAPTER 2

### Compliance testing for synchronous power-generating modules

#### *Article 44*

#### **Compliance tests for type B synchronous power-generating modules**

1. Power-generating facility owners shall undertake LFSM-O response compliance tests in relation to type B synchronous power-generating modules.

Instead of carrying out the relevant test, power-generating facility owners may rely upon equipment certificates issued by an authorised certifier to demonstrate compliance with the relevant requirement. In such a case, the equipment certificates shall be provided to the relevant system operator.

2. The following requirements with regard to the LFSM-O response test shall apply:

(a) the power-generating module's technical capability to continuously modulate active power to contribute to frequency control in case of any large increase of frequency in the system shall be demonstrated. The steady-state parameters of regulations, such as droop and deadband, and dynamic parameters, including frequency step change response shall be verified;

(b) the test shall be carried out by simulating frequency steps and ramps big enough to trigger at least 10% of maximum capacity change in active power, taking into account the droop settings and the deadband. If required, simulated frequency deviation signals shall be injected simultaneously at both the speed governor and load controller of the control systems, taking into account the scheme of those control systems;

(c) the test shall be deemed successful if the following conditions are fulfilled:

(i) the test results, for both dynamic and static parameters, meet the requirements set out in Article 13(2); and

(ii) undamped oscillations do not occur after the step change response.

### **Article 45**

#### **Compliance tests for type C synchronous power-generating modules**

1. In addition to the compliance tests for type B synchronous power-generating modules described in Article 44, power-generating facility owners shall undertake the compliance tests set out in paragraphs 2, 3, 4 and 6 of this Article in relation to type C synchronous power-generating modules. Where a power-generating module provides black start capability, power-generating facility owners shall also undertake the tests referred to in paragraph 5. Instead of the relevant test, the power-generating facility owner may use equipment certificates issued by an authorised certifier to demonstrate compliance with the relevant requirement. In that case, the equipment certificates shall be provided to the relevant system operator.

2. The following requirements with regard to the LFSM-U response test shall apply:

(a) it shall demonstrate that the power-generating module is technically capable of continuously modulating active power at operating points below maximum capacity to contribute to frequency control in case of a large frequency drop in the system;

(b) the test shall be carried out by simulating appropriate active power load points, with low frequency steps and ramps big enough to trigger active power change of at least 10 % of maximum capacity, taking into account the droop settings and the deadband. If required, simulated frequency deviation signals shall be injected simultaneously into both the speed governor and the load controller references;

(c) the test shall be deemed successful if the following conditions are fulfilled:

(i) the test results, for both dynamic and static parameters, comply with point (c) of Article 15(2); and

(ii) undamped oscillations do not occur after the step change response.

3. The following requirements with regard to the FSM response test shall apply:

(a) it shall demonstrate that the power-generating module is technically capable of continuously modulating active power over the full operating range between maximum capacity and minimum regulating level to contribute to frequency control. The steady-state parameters of regulations, such as droop and deadband and dynamic parameters, including robustness through frequency step change response and large, fast frequency deviations shall be verified;

(b) the test shall be carried out by simulating frequency steps and ramps big enough to trigger the whole active power frequency response range, taking into account the settings of droop and deadband, as well as the capability to actually increase or decrease active power output from the respective operating point. If required, simulated frequency deviation signals shall be injected simultaneously into the references of both the speed governor and the load controller of the unit or plant control system;

(c) the test shall be deemed successful if the following conditions are fulfilled:

(i) the activation time of full active power frequency response range as a result of a frequency step change is no longer than required by point (d) of Article 15(2);

(ii) undamped oscillations do not occur after the step change response;

(iii) the initial delay time complies with point (d) of Article 15(2);

(iv) the droop settings are available within the range specified in point (d) of Article 15(2) and the deadband (threshold) is not higher than the value specified in that Article; and

(v) the insensitivity of active power frequency response at any relevant operating point does not exceed the requirements set out in point (d) of Article 15(2).

4. With regard to the frequency restoration control test the following requirements shall apply:

(a) the power-generating module's technical capability to participate in frequency restoration control shall be demonstrated and the cooperation of FSM and frequency restoration control shall be checked;

(b) the test shall be deemed successful if the results, for both dynamic and static parameters, comply with the requirements of point (e) of Article 15(2).

5. With regard to the black start capability test the following requirements shall apply:

(a) for power-generating modules with black start capability, this technical capability to start from shut down without any external electrical energy supply shall be demonstrated;

(b) the test shall be deemed successful if the start-up time is kept within the time frame set out in point (iii) of Article 15(5)(a).

6. With regard to the tripping to houseload test the following requirements shall apply:

(a) the power-generating modules' technical capability to trip to and stably operate on house load shall be demonstrated;

(b) the test shall be carried out at the maximum capacity and nominal reactive power of the power-generating module before load shedding;

(c) the relevant system operator shall have the right to set additional conditions, taking into account point (c) of Article 15(5);

(d) the test shall be deemed successful if tripping to house load is successful, stable houseload operation has been demonstrated in the time period set out in point (c) of Article 15(5) and re-synchronisation to the network has been performed successfully.

7. With regard to the reactive power capability test the following requirements shall apply:

(a) the power-generating module's technical capability to provide leading and lagging reactive power capability in accordance with points (b) and (c) of Article 18(2) shall be demonstrated;

(b) the test shall be deemed successful if the following conditions are fulfilled:

(i) the power-generating module operates at maximum reactive power for at least one hour, both leading and lagging, at:

— minimum stable operating level,

— maximum capacity, and

— an active power operating point between those maximum and minimum levels;

(ii) the power-generating module's capability to change to any reactive power target value within the agreed or decided reactive power range shall be demonstrated.

**Article 46****Compliance tests for type D synchronous power-generating modules**

1. Type D synchronous power-generating modules are subject to the compliance tests for type B and C synchronous power-generating modules described in Articles 44 and 45.
2. Instead of the relevant test, the power-generating facility owner may use equipment certificates issued by an authorised certifier to demonstrate compliance with the relevant requirement. In such a case, the equipment certificates shall be provided to the relevant system operator.

**CHAPTER 3****Compliance testing for power park modules****Article 47****Compliance tests for type B power park modules**

1. Power-generating facility owners shall undertake LFSM-O response compliance tests in relation to type B power park modules.

Instead of the relevant test, the power-generating facility owner may use equipment certificates issued by an authorised certifier to demonstrate compliance with the relevant requirement. In that case, the equipment certificates shall be provided to the relevant system operator.

2. With regard to type B power park modules, the LFSM-O response tests shall reflect the choice of control scheme selected by the relevant system operator.

3. With regard to the LFSM-O response tests the following requirements shall apply:

(a) the power park module's technical capability to continuously modulate active power to contribute to frequency control in case of increase of frequency in the system shall be demonstrated. The steady-state parameters of regulations, such as droop and deadband, and dynamic parameters shall be verified;

(b) the test shall be carried out by simulating frequency steps and ramps big enough to trigger at least 10% of maximum capacity change in active power, taking into account the droop settings and the deadband. To perform this test simulated frequency deviation signals shall be injected simultaneously into the control system references;

(c) the test shall be deemed successful in the event that the test results, for both dynamic and static parameters, comply with the requirements set out in Article 13(2).

**Article 48****Compliance tests for type C power park modules**

1. In addition to the compliance tests for type B power park modules described in Article 47, pow-

er-generating facility owners shall undertake the compliance tests set out in paragraphs 2 to 9 in relation to type C power park modules. Instead of the relevant test, the power-generating facility owner may use equipment certificates issued by an authorised certifier to demonstrate compliance with the relevant requirement. In such a case, the equipment certificate shall be provided to the relevant system operator.

2. With regard to the active power controllability and control range test the following requirements shall apply:

(a) the power park module's technical capability to operate at a load level below the setpoint set by the relevant system operator or the relevant TSO shall be demonstrated;

(b) the test shall be deemed successful if the following conditions are fulfilled:

(i) the load level of the power park module is kept below the setpoint;

(ii) the setpoint is implemented according to the requirements laid down in Article 15(2)(a); and

(iii) the accuracy of the regulation complies with the value specified in point (a) of Article 15(2).

3. With regard to the LFSM-U response test the following requirements shall apply:

(a) the power park module's technical capability to continuously modulate active power to contribute to frequency control in case of a large frequency drop in the system shall be demonstrated;

(b) the test shall be carried out by simulating the frequency steps and ramps big enough to trigger at least 10% of maximum capacity active power change with a starting point of no more than 80% of maximum capacity, taking into account the droop settings and the deadband;

(c) the test shall be deemed successful if the following conditions are fulfilled:

(i) the test results, for both dynamic and static parameters, comply with the requirements laid down in Article 15(2)(c); and

(ii) undamped oscillations do not occur after the step change response.

4. With regard to the FSM response test the following requirements shall apply:

(a) the power park module's technical capability to continuously modulate active power over the full operating range between maximum capacity and minimum regulating level to contribute to frequency control shall be demonstrated. The steady-state parameters of regulations, such as insensitivity, droop, deadband and range of regulation, as well as dynamic parameters, including frequency step change response shall be verified;

(b) the test shall be carried out by simulating frequency steps and ramps big enough to trigger the whole active power frequency response range, taking into account the droop settings and the deadband. Simulated frequency deviation signals shall be injected to perform the test;

(c) the test shall be deemed successful if the following conditions are fulfilled:

(i) the activation time of the full active power frequency response range as a result of a frequency step change is no longer than that required by point (d) of Article 15(2);

(ii) undamped oscillations do not occur after the step change response;

(iii) the initial delay is in line with point (d) of Article 15(2);

(iv) the droop settings are available within the ranges specified in point (d) of Article 15(2) and the deadband (threshold) is not higher than the value chosen by the relevant TSO; and

(v) the insensitivity of active power frequency response does not exceed the requirement set out in point (d) of Article 15(2).

5. With regard to the frequency restoration control test the following requirements shall apply:

(a) the power park module's technical capability to participate in frequency restoration control shall be demonstrated. The cooperation of both FSM and frequency restoration control shall be checked;

(b) the test shall be deemed successful if the results for both dynamic and static parameters comply with the requirements of point (e) of Article 15(2).

6. With regard to the reactive power capability test the following requirements shall apply:

(a) the power park module's technical capability to provide leading and lagging reactive power capability in accordance with points (b) and (c) of Article 21(3) shall be demonstrated;

(b) it shall be carried out at maximum reactive power, both leading and lagging, and shall verify the following parameters:

(i) operation in excess of 60% of maximum capacity for 30 min;

(ii) operation within the range of 30-50% of maximum capacity for 30 min; and

(iii) operation within the range of 10-20% of maximum capacity for 60 min;

(c) the test shall be deemed successful if the following criteria are fulfilled:

(i) the power park module operates for a duration no shorter than the requested duration at maximum reactive power, both leading and lagging, in each parameter specified in paragraph 6(b);

(ii) the power park module's capability to change to any reactive power target value within the agreed or decided reactive power range is demonstrated; and

(iii) no protection action takes place within the operation limits specified by the reactive power capacity diagram.

7. With regard to the voltage control mode test the following requirements shall apply:

(a) the power park module's capability to operate in voltage control mode referred to in the conditions set out in points (ii) to (iv) of Article 21(3)(d) shall be demonstrated;

(b) The voltage control mode test shall verify the following parameters:

(i) the implemented slope and deadband according to Article 21(3)(d)(iii);

(ii) the accuracy of the regulation;

(iii) the insensitivity of the regulation; and

(iv) the time of reactive power activation;

(c) The test shall be deemed successful if the following conditions are fulfilled:

(i) the range of regulation and adjustable droop and deadband complies with the agreed or decided characteristic parameters set out in point (d) of Article 21(3);

(ii) the insensitivity of voltage control is not higher than 0,01 pu, in accordance with point (d) of Article 21(3); and

(iii) following a step change in voltage, 90% of the change in reactive power output has been achieved within the times and tolerances specified in point (d) of Article 21(3).

8. With regard to the reactive power control mode test the following requirements shall apply:

- (a) the power park module's capability to operate in reactive power control mode, in accordance with point (v) of Article 21(3)(d), shall be demonstrated;
  - (b) the reactive power control mode test shall be complementary to the reactive power capability test;
  - (c) the reactive power control mode test shall verify the following parameters:
    - (i) the reactive power setpoint range and increment;
    - (ii) the accuracy of the regulation; and
    - (iii) the time of reactive power activation.
  - (d) the test shall be deemed successful if the following conditions are fulfilled:
    - (i) the reactive power setpoint range and increment are ensured in accordance with point (d) of Article 21(3); and
    - (ii) the accuracy of the regulation complies with the conditions set out in point (d) of Article 21(3).
9. With regard to the power factor control mode test the following requirements shall apply:
- (a) the power park module's capability to operate in power factor control mode in accordance with point (vi) of Article 21(3)(d) shall be demonstrated;
  - (b) the power factor control mode test shall verify the following parameters:
    - (i) the power factor setpoint range;
    - (ii) the accuracy of the regulation; and
    - (iii) the response of reactive power due to step change of active power;
  - (c) the test shall be deemed successful if the following conditions are cumulatively fulfilled:
    - (i) the power factor setpoint range and increment are ensured in accordance with point (d) of Article 21(3);
    - (ii) the time of reactive power activation as a result of step active power change does not exceed the requirement laid down in point (d) of Article 21(3); and
    - (iii) the accuracy of the regulation complies with the value specified in point (d) of Article 21(3).
10. With regard to the tests referred to in paragraphs 7, 8 and 9, the relevant system operator may select only one of the three control options for testing.

### **Article 49**

#### **Compliance tests for type D power park modules**

1. Type D power park modules are subject to the compliance tests for type B and C power park modules in accordance with the conditions set out in Articles 47 and 48.
2. Instead of the relevant test, the power-generating facility owner may use equipment certificates issued by an authorised certifier to demonstrate compliance with the relevant requirement. In that case, the equipment certificates shall be provided to the relevant system operator.

## CHAPTER 4

### Compliance testing for offshore power park modules

#### *Article 50*

#### Compliance tests for offshore power park modules

The compliance tests established in Article 44(2), as well as in paragraphs 2, 3, 4, 5, 7, 8 and 9 of Article 48 shall apply to offshore power park modules.

## CHAPTER 5

### Compliance simulations for synchronous power-generating modules

#### *Article 51*

#### Compliance simulations for type B synchronous power-generating modules

1. Power-generating facility owners shall undertake LFSM-O response simulations in relation to type B synchronous power-generating modules. Instead of the relevant simulations, the power-generating facility owner may use equipment certificates issued by an authorised certifier to demonstrate compliance with the relevant requirement. In that case, the equipment certificates shall be provided to the relevant system operator.

2. With regard to the LFSM-O response simulation the following requirements shall apply:

- (a) the power-generating module's capability to modulate active power at high frequency in accordance with Article 13(2) shall be demonstrated by simulation;
- (b) the simulation shall be carried out by means of high frequency steps and ramps reaching minimum regulating level, taking into account the droop settings and the deadband;
- (c) the simulation shall be deemed successful in the event that:
  - (i) the simulation model of the power-generating module is validated against the compliance test for LFSM-O response described in Article 44(2); and
  - (ii) compliance with the requirement set out in Article 13(2) is demonstrated.

3. With regard to the simulation of fault-ride-through capability of type B synchronous power-generating modules, the following requirements shall apply:

- (a) the power-generating module's capability to ride through faults in accordance with the conditions set out in subparagraph (a) of Article 14(3) shall be demonstrated by simulation;
- (b) the simulation shall be deemed successful if compliance with the requirement set out in point (a) of Article 14(3) is demonstrated.

4. With regard to the post fault active power recovery simulation the following requirements shall apply:

- (a) the power-generating module's capability to provide post fault active power recovery referred to

in the conditions set out in Article 17(3) shall be demonstrated;

(b) the simulation shall be deemed successful if compliance with the requirement set out in Article 17(3) is demonstrated.

## **Article 52**

### **Compliance simulations for type C synchronous power-generating modules**

1. In addition to the compliance simulations for type B synchronous power-generating modules set out in Article 51, type C synchronous power-generating modules shall be subject to the compliance simulations detailed in paragraphs 2 to 5. Instead of all or part of those simulations, the power-generating facility owner may use equipment certificates issued by an authorised certifier, which must be provided to the relevant system operator.

2. With regard to the LFSM-U response simulation the following requirements shall apply:

(a) the power-generating module's capability to modulate active power at low frequencies in accordance with point (c) of Article 15(2) shall be demonstrated;

(b) the simulation shall be carried out by means of low frequency steps and ramps reaching maximum capacity, taking into account the droop settings and the deadband;

(c) the simulation shall be deemed successful in the event that:

(i) the simulation model of the power-generating module is validated against the compliance test for LFSM-U response described in of Article 45(2); and

(ii) compliance with the requirement of point (c) of Article 15(2) is demonstrated.

3. With regard to the FSM response simulation the following requirements shall apply:

(a) the power-generating module's capability to modulate active power over the full frequency range in accordance with point (d) of Article 15(2) shall be demonstrated;

(b) the simulation shall be carried out by simulating frequency steps and ramps big enough to trigger the whole active power frequency response range, taking into account the droop settings and the deadband;

(c) the simulation shall be deemed successful in the event that:

(i) the simulation model of the power-generating module is validated against the compliance test for FSM response described in Article 45(3); and

(ii) compliance with the requirement of point (d) of Article 15(2) is demonstrated.

4. With regard to the island operation simulation the following requirements shall apply:

(a) the power-generating module's performance during island operation referred to in the conditions set out in point (b) of Article 15(5) shall be demonstrated;

(b) the simulation shall be deemed successful if the power-generating module reduces or increases the active power output from its previous operating point to any new operating point within the P-Q-capability diagram within the limits of point (b) of Article 15(5), without disconnection of the power-generating module from the island due to over- or underfrequency.

5. With regard to the reactive power capability simulation the following requirements shall apply:
- (a) the power-generating module's capability to provide leading and lagging reactive power capability in accordance with the conditions set out in points (b) and (c) of Article 18(2) shall be demonstrated;
  - (b) the simulation shall be deemed successful if the following conditions are fulfilled:
    - (i) the simulation model of the power-generating module is validated against the compliance tests for reactive power capability described in Article 45(7); and
    - (ii) compliance with the requirements of points (b) and (c) of Article 18(2) is demonstrated.

### **Article 53**

#### **Compliance simulations for type D synchronous power-generating modules**

1. In addition to the compliance simulations for type B and C synchronous power-generating modules set out in Articles 51 and 52, except for the simulation of fault-ride-through capability of type B synchronous power-generating modules referred to in Article 51(3), type D synchronous power-generating modules are subject to the compliance simulations set out in paragraphs 2 and 3. Instead of all or part of those simulations, the power-generating facility owner may use equipment certificates issued by an authorised certifier, which must be provided to the relevant system operator.
2. With regard to the power oscillations damping control simulation the following requirements shall apply:
  - (a) it shall be demonstrated that the power-generating module's performance in terms of its control system ('PSS function') is capable of damping active power oscillations in accordance with the conditions set out in paragraph 2 of Article 19;
  - (b) the tuning must result in improved damping of corresponding active power response of the AVR in combination with the PSS function, compared to the active power response of the AVR alone;
  - (c) the simulation shall be deemed successful if the following conditions are cumulatively fulfilled:
    - (i) the PSS function damps the existing active power oscillations of the power-generating module within a frequency range specified by the relevant TSO. That frequency range shall include the local mode frequencies of the power-generating module and the expected network oscillations; and
    - (ii) a sudden load reduction of the power-generating module from 1 pu to 0,6 pu of the maximum capacity does not lead to undamped oscillations in active or reactive power of the power-generating module.
3. With regard to the simulation of fault-ride-through capability of type D synchronous power-generating modules, the following requirements shall apply:
  - (a) the power-generating module's capability to provide fault-ride-through in accordance with the conditions set out in point (a) of Article 16(3) shall be demonstrated;
  - (b) the simulation shall be deemed successful if compliance with the requirement laid down in point (a) of Article 16(3) is demonstrated.

## CHAPTER 6

### Compliance simulations for power park modules

#### *Article 54*

#### Compliance simulations for type B power park modules

1. Type B power park modules are subject to the compliance simulations in paragraphs 2 to 5. Instead of all or part of those simulations, the power-generating facility owner may use equipment certificates issued by an authorised certifier, which must be provided to the relevant system operator.
2. With regard to the LFSM-O response simulation the following requirements shall apply:
  - (a) the power park module's capability to modulate active power at high frequency in accordance with Article 13(2) shall be demonstrated;
  - (b) the simulation shall be carried out by means of high frequency steps and ramps reaching minimum regulating level, taking into account the droop settings and the deadband;
  - (c) the simulation shall be deemed successful in the event that:
    - (i) the simulation model of the power park module is validated against the compliance test for LFSM-O response set out in Article 47(3); and
    - (ii) compliance with the requirement laid down in Article 13(2) is demonstrated.
3. With regard to the fast fault current injection simulation the following requirements shall apply:
  - (a) the power park module's capability to provide fast fault current injection in accordance with the conditions set out in point (b) of Article 20(2) shall be demonstrated;
  - (b) the simulation shall be deemed successful if compliance with the requirement laid down in point (b) of Article 20(2) is demonstrated.
4. With regard to the fault-ride-through simulation capability of type B power park modules, the following requirements shall apply:
  - (a) the power park module's capability to ride through faults in accordance with the conditions set out in point (a) of Article 14(3) shall be demonstrated by simulation;
  - (b) the simulation shall be deemed successful if compliance with the requirement laid down in point (a) of Article 14(3) is demonstrated.
5. The following requirements with regard to the post fault active power recovery simulation shall apply:
  - (a) the power park module's capability to provide post fault active power recovery in accordance with the conditions set out in Article 20(3) shall be demonstrated;
  - (b) the simulation shall be deemed successful if compliance with the requirement laid down in Article 20(3) is demonstrated.

## Article 55

### Compliance simulations for type C power park modules

1. In addition to the compliance simulations for type B power park modules set out in Article 54, type C power park modules are subject to the compliance simulations set out in paragraphs 2 to 7. Instead of all or part of those simulations, the power-generating facility owner may use equipment certificates issued by an authorised certifier, which must be provided to the relevant system operator.

2. With regard to the LFSM-U response simulation the following requirements shall apply:

(a) the power park module's capability to modulate active power at low frequencies in accordance with point (c) of Article 15(2) shall be demonstrated;

(b) the simulation shall be carried out by simulating low frequency steps and ramps reaching maximum capacity, taking into account the droop settings and the deadband;

(c) the simulation shall be deemed successful in the event that:

(i) the simulation model of the power park module is validated against the compliance test for LFSM-U response set out in Article 48(3); and

(ii) compliance with the requirement laid down in point (c) of Article 15(2) is demonstrated.

3. With regard to the FSM response simulation the following requirements shall apply:

(a) the power park module's capability to modulate active power over the full frequency range as referred to in point (d) of Article 15(2) shall be demonstrated;

(b) the simulation shall be carried out by simulating frequency steps and ramps big enough to trigger the whole active power frequency response range, taking into account the droop settings and the deadband;

(c) the simulation shall be deemed successful in the event that:

(i) the simulation model of the power park module is validated against the compliance test for FSM response set out in Article 48(4); and

(ii) compliance with the requirement laid down in point (d) of Article 15(2) is demonstrated.

4. With regard to the island operation simulation, the following requirements shall apply:

(a) the power park module's performance during island operation in accordance with the conditions set out in point (b) of Article 15(5) shall be demonstrated;

(b) the simulation shall be deemed successful in the event that the power park module reduces or increases the active power output from its previous operating point to any new operating point, within the P-Q-capability diagram and within the limits set out in point (b) of Article 15(5), without disconnection of the power park module from the island due to over- or underfrequency.

5. With regard to the simulation of the capability of providing synthetic inertia, the following requirements shall apply:

(a) the model of the power park module's capability of providing synthetic inertia to a low frequency event as set out in point (a) of Article 21(2) shall be demonstrated;

(b) the simulation shall be deemed successful if the model demonstrates that it complies with the conditions set out in Article 21(2).

6. With regard to the reactive power capability simulation, the following requirements shall apply:
- (a) the power park module shall demonstrate that it can provide leading and lagging reactive power capability as set out in points (b) and (c) of Article 21(3);
  - (b) the simulation shall be deemed successful if the following conditions are cumulatively fulfilled:
    - (i) the simulation model of the power park module is validated against the compliance tests for reactive power capability set out in paragraph 6 of Article 48; and
    - (ii) compliance with the requirements laid down in points (b) and (c) of Article 21(3) is demonstrated.
7. With regard to the power oscillations damping control simulation, the following requirements shall apply:
- (a) the model of the power park module shall demonstrate that it can provide active power oscillations damping capability accordance with point (f) of Article 21(3);
  - (b) the simulation shall be deemed successful in the event that the model demonstrates compliance with the conditions described in point (f) of Article 21(3).

### **Article 56**

#### **Compliance simulations for type D power park modules**

1. In addition to the compliance simulations for type B and C power park modules set out in Articles 54 and 55, except for the fault-ride-through capability of type B power park modules referred to in Article 54(4), type D power park modules are subject to the fault-ride-through capability of power park modules compliance simulation.
2. Instead of all or part of the simulations mentioned in paragraph 1, the power-generating facility owner may use equipment certificates issued by an authorised certifier, which must be provided to the relevant system operator.
3. The model of the power park module shall demonstrate that it is suitable for simulating the fault-ride-through capability in accordance with point (a) of Article 16(3).
4. The simulation shall be deemed successful if the model demonstrates compliance with the conditions set out in point (a) of Article 16(3).

## **CHAPTER 7**

### **Compliance simulations for offshore power park modules**

#### **Article 57**

#### **Compliance simulations applicable to offshore power park modules**

The compliance simulations specified in paragraphs 3 and 5 of Article 54 as well as in paragraphs 4, 5 and 7 of Article 55 shall apply to any offshore power park module.

## CHAPTER 8

### Non-binding guidance and monitoring of implementation

#### Article 58

##### Non-binding guidance on implementation

1. <...>
2. <...>
3. The non-binding guidance **published by ENTSO for Electricity** explains the technical issues, conditions and interdependencies which need to be considered when complying with the requirements of this Regulation at national level.

#### Article 59

##### Monitoring

1. ENTSO for Electricity shall monitor the implementation of this Regulation <...> **for the Contracting Parties whose TSOs are members of ENTSO for Electricity. The Secretariat and the Energy Community Regulatory Board shall monitor the implementation of this Regulation for the Contracting Parties whose TSOs are not members of ENTSO for Electricity**'. Monitoring shall take into account the list of relevant information developed by the Agency for the Cooperation of Energy Regulators and it shall cover in particular the following matters:

- (a) identification of any divergences in the national implementation of this Regulation;
- (b) assessment of whether the choice of values and ranges in the requirements applicable to power-generating modules under this Regulation continues to be valid.

**ENTSO for Electricity shall report its findings to the Secretariat and the Energy Community Regulatory Board. The Secretariat and the Energy Community Regulatory Board shall make available the findings stemming from the monitoring of the implementation of this Regulation.**

2. <...>
3. Relevant TSOs shall submit to the **Secretariat, the Energy Community Regulatory Board and ENTSO for Electricity** the information required to perform the tasks referred to in paragraph 1. Based on a request of the regulatory authority, DSOs shall provide TSOs with information under paragraph 1 unless the information is already obtained by regulatory authorities, **the Secretariat, Energy Community Regulatory Board** or ENTSO-E in relation to their respective implementation monitoring tasks, with the objective of avoiding duplication of information.

4. <...>

## TITLE V

### DEROGATIONS

#### *Article 60*

##### **Power to grant derogations**

1. Regulatory authorities may, at the request of a power-generating facility owner or prospective owner, relevant system operator or relevant TSO, grant power-generating facility owners or prospective owners, relevant system operators or relevant TSOs derogations from one or more provisions of this Regulation for new and existing power-generating modules in accordance with Articles 61 to 63.
2. Where applicable in a **Contracting Party**, derogations may be granted and revoked in accordance with Articles 61 to 63 by other authorities than the regulatory authority.

#### *Article 61*

##### **General provisions**

1. Each regulatory authority shall specify, after consulting relevant system operators and power-generating facility owners and other stakeholders whom it deems affected by this Regulation, the criteria for granting derogations pursuant to Articles 62 and 63. It shall publish those criteria on its website and notify them to the **Secretariat** within nine months of the **expiry of the deadline for transposition** of this Regulation. The **Secretariat** may require a regulatory authority to amend the criteria if it considers that they are not in line with this Regulation. This possibility to review and amend the criteria for granting derogations shall not affect the derogations already granted which shall continue to apply until the scheduled expiry date as detailed in the decision granting the exemption.
2. If the regulatory authority deems that it is necessary due to a change in circumstances relating to the evolution of system requirements, it may review and amend at most once every year the criteria for granting derogations in accordance with paragraph 1. Any changes to the criteria shall not apply to derogations for which a request has already been made.
3. The regulatory authority may decide that power-generating modules for which a request for a derogation has been filed pursuant to Articles 62 or 63 do not need to comply with the requirements of this Regulation from which a derogation has been sought from the day of filing the request until the regulatory authority's decision is issued.

#### *Article 62*

##### **Request for a derogation by a power-generating facility owner**

1. Power-generating facility owners, or prospective owners, may request a derogation to one or several requirements of this Regulation for power-generating modules within their facilities.
2. A request for a derogation shall be filed with the relevant system operator and include:
  - (a) an identification of the power-generating facility owner, or prospective owner, and a contact

person for any communications;

(b) a description of the power-generating module or modules for which a derogation is requested;

(c) a reference to the provisions of this Regulation from which a derogation is requested and a detailed description of the requested derogation;

(d) detailed reasoning, with relevant supporting documents and cost-benefit analysis pursuant to the requirements of Article 39;

(e) demonstration that the requested derogation would have no adverse effect on cross-border trade.

3. Within two weeks of receipt of a request for a derogation, the relevant system operator shall confirm to the power-generating facility owner, or prospective owner, whether the request is complete. If the relevant system operator considers that the request is incomplete, the power-generating facility owner, or prospective owner, shall submit the additional required information within one month from the receipt of the request for additional information. If the power-generating facility owner, or prospective owner, does not supply the requested information within that time limit, the request for a derogation shall be deemed withdrawn.

4. The relevant system operator shall, in coordination with the relevant TSO and any affected adjacent DSO or DSOs, assess the request for a derogation and the provided cost-benefit analysis, taking into account the criteria determined by the regulatory authority pursuant to Article 61.

5. If a request for a derogation concerns a type C or D power-generating module connected to a distribution system, including a closed distribution system, the relevant system operator's assessment must be accompanied by an assessment of the request for a derogation by the relevant TSO. The relevant TSO shall provide its assessment within two months of being requested to do so by the relevant system operator.

6. Within six months of receipt of a request for a derogation, the relevant system operator shall forward the request to the regulatory authority and submit the assessment(s) prepared in accordance with paragraphs 4 and 5. That period may be extended by one month where the relevant system operator seeks further information from the power-generating facility owner, or prospective owner and by two months where the relevant system operator requests the relevant TSO to submit an assessment of the request for a derogation.

7. The regulatory authority shall adopt a decision concerning any request for a derogation within six months from the day after it receives the request. That time limit may be extended by three months before its expiry where the regulatory authority requires further information from the power-generating facility owner, or prospective owner, or from any other interested parties. The additional period shall begin when the complete information has been received.

8. The power-generating facility owner, or prospective owner, shall submit any additional information requested by the regulatory authority within two months of such request. If the power-generating facility owner, or prospective owner, does not supply the requested information within that time limit, the request for a derogation shall be deemed withdrawn unless, before its expiry:

(a) the regulatory authority decides to provide an extension; or

(b) the power-generating facility owner, or prospective owner, informs the regulatory authority by means of a reasoned submission that the request for a derogation is complete.

9. The regulatory authority shall issue a reasoned decision concerning a request for a derogation.

Where the regulatory authority grants a derogation, it shall specify its duration.

10. The regulatory authority shall notify its decision to the relevant power-generating facility owner, or prospective owner, the relevant system operator and the relevant TSO.

11. A regulatory authority may revoke a decision granting a derogation if the circumstances and underlying reasons no longer apply or upon a reasoned recommendation of the **Secretariat** or reasoned recommendation by the **Energy Community Regulatory Board** pursuant to Article 65(2).

12. For Type A power-generating modules, a request for a derogation under this Article may be made by a third party on behalf of the power-generating facility owner, or prospective owner. Such a request may be for a single power-generating module or multiple, identical power-generating modules. In the case of the latter, and provided the cumulative maximum capacity is specified, the third party may substitute the details required by point (a) of paragraph 2 with their details.

### **Article 63**

#### **Request for a derogation by a relevant system operator or relevant TSO**

1. Relevant system operators or relevant TSOs may request derogations for classes of power-generating modules connected or to be connected to their network.

2. Relevant system operators or relevant TSOs shall submit their requests for derogations to the regulatory authority. Each request for a derogation shall include:

(a) identification of the relevant system operator or relevant TSO, and a contact person for any communications;

(b) a description of the power-generating modules for which a derogation is requested and the total installed capacity and number of power-generating modules;

(c) the requirement or requirements of this Regulation for which a derogation is requested, with a detailed description of the requested derogation;

(d) detailed reasoning, with all relevant supporting documents;

(e) demonstration that the requested derogation would have no adverse effect on cross-border trade;

(f) a cost-benefit analysis pursuant to the requirements of Article 39. If applicable, the cost-benefit analysis shall be carried out in coordination with the relevant TSO and any adjacent DSO or DSOs.

3. Where the request for a derogation is submitted by a relevant DSO or CDSO, the regulatory authority shall, within two weeks from the day after receipt of that request, ask the relevant TSO to assess the request for a derogation in the light of the criteria determined by the regulatory authority pursuant to Article 61.

4. Within two weeks from the day after the receipt of such request for assessment, the relevant TSO shall confirm to the relevant DSO or CDSO whether the request for a derogation is complete. If the relevant TSO considers that it is incomplete, the relevant DSO or CDSO shall submit the required additional information within one month from the receipt of the request for additional information.

5. Within six months of receipt of a request for a derogation, the relevant TSO shall submit to the regulatory authority its assessment, including any relevant documentation. The six-month time limit

may be extended by one month where the relevant TSO seeks further information from the relevant DSO or from the relevant CDSO.

6. The regulatory authority shall adopt a decision concerning a request for a derogation within six months from the day after it receives the request. Where the request for a derogation is submitted by the relevant DSO or CDSO, the six-month time limit runs from the day following receipt of the relevant TSO's assessment pursuant to paragraph 5.

7. The six-month time limit referred to in paragraph 6 may, before its expiry, be extended by an additional three months where the regulatory authority requests further information from the relevant system operator requesting the derogation or from any other interested parties. That additional period shall run from the day following the date of receipt of the complete information.

The relevant system operator shall provide any additional information requested by the regulatory authority within two months from the date of the request. If the relevant system operator does not provide the requested additional information within that time limit, the request for a derogation shall be deemed withdrawn unless, before expiry of the time limit:

- (a) the regulatory authority decides to provide an extension; or
- (b) the relevant system operator informs the regulatory authority by means of a reasoned submission that the request for a derogation is complete.

8. The regulatory authority shall issue a reasoned decision concerning a request for a derogation. Where the regulatory authority grants derogation, it shall specify its duration.

9. The regulatory authority shall notify its decision to the relevant system operator requesting the derogation, the relevant TSO, **the Energy Community Regulatory Board and the Secretariat**.

10. Regulatory authorities may lay down further requirements concerning the preparation of requests for derogation by relevant system operators. In doing so, regulatory authorities shall take into account the delineation between the transmission system and the distribution system at the national level and shall consult with system operators, power-generating facility owners and stakeholders, including manufacturers.

11. A regulatory authority may revoke a decision granting a derogation if the circumstances and underlying reasons no longer apply or upon a reasoned recommendation of the **Secretariat** or reasoned recommendation by the **Energy Community Regulatory Board** pursuant to Article 65(2).

#### **Article 64**

##### **Register of derogations from the requirements of this Regulation**

1. Regulatory authorities shall maintain a register of all derogations they have granted or refused and shall provide the **Energy Community Regulatory Board and the Secretariat** with an updated and consolidated register at least once every six months, a copy of which shall be given to ENTSO for Electricity.

2. The register shall contain, in particular:

- (a) the requirement or requirements for which the derogation is granted or refused;
- (b) the content of the derogation;

- (c) the reasons for granting or refusing the derogation;
- (d) the consequences resulting from granting the derogation.

### **Article 65**

#### **Monitoring of derogations**

1. The **Energy Community Regulatory Board and the Secretariat** shall monitor the procedure of granting derogations with the cooperation of the regulatory authorities or relevant authorities of the **Contracting Party**. Those authorities or relevant authorities of the **Contracting Party** shall provide the **Energy Community Regulatory Board and the Secretariat** with all the information necessary for that purpose.
2. The **Energy Community Regulatory Board** may issue a reasoned recommendation to a regulatory authority to revoke a derogation due to a lack of justification. The **Secretariat** may issue a reasoned recommendation to a regulatory authority or relevant authority of the **Contracting Party** to revoke derogation due to a lack of justification.
3. The **Secretariat** may request the **Energy Community Regulatory Board** to report on the application of paragraphs 1 and 2 and to provide reasons for requesting or not requesting derogations to be revoked.

## **TITLE VI**

### **TRANSITIONAL ARRANGEMENTS FOR EMERGING TECHNOLOGIES**

#### **Article 66**

##### **Emerging technologies**

1. With the exception of Article 30, the requirements of this Regulation shall not apply to power-generating modules classified as an emerging technology, in accordance with the procedures set out in this Title.
2. A power-generating module shall be eligible to be classified as an emerging technology pursuant to Article 69, provided that:
  - (a) it is of type A;
  - (b) it is a commercially available power-generating module technology; and
  - (c) the accumulated sales of the power-generating module technology within a synchronous area at the time of application for classification as an emerging technology do not exceed 25 % of the maximum level of cumulative maximum capacity established pursuant to Article 67(1).

### **Article 67**

#### **Establishment of thresholds for classification as emerging technologies**

1. The maximum level of cumulative maximum capacity of power-generating modules classified as emerging technologies in a synchronous area shall be 0.1% of the annual maximum load in 2014 in that synchronous area.
  2. **Contracting Parties** shall ensure that their maximum level of cumulative maximum capacity of power-generating modules classified as emerging technologies is calculated by multiplying the maximum level of cumulative maximum capacity of power-generating modules classified as emerging technologies of a synchronous area with the ratio of annual electrical energy generated in 2014 in the **Contracting Party** to the total annual electrical energy generated in 2014 in the respective synchronous area to which the **Contracting Party** belongs.
- For **Contracting Parties** belonging to parts of different synchronous areas, the calculation shall be carried out on a pro rata basis for each of those parts and combined to give the total allocation to that **Contracting Party**.
3. The source of the data for applying this Article shall be the ENTSO for Electricity's Statistical fact-sheet published in 2015.

### **Article 68**

#### **Application for classification as an emerging technology**

1. Within six months of the **expiry of the deadline for transposition** of this Regulation manufacturers of Type A power-generating modules may submit to the relevant regulatory authority a request for classification of their power-generating module technology as an emerging technology.
2. In connection with a request pursuant to paragraph 1, the manufacturer shall inform the relevant regulatory authority of the accumulated sales of the respective power-generating module technology within each synchronous area at the time of application for classification as an emerging technology.
3. Proof that a request submitted pursuant to paragraph 1 complies with the eligibility criteria laid down in Articles 66 and 67 shall be provided by the manufacturer.
4. Where applicable in a **Contracting Party**, assessment of requests and approval and withdrawal of classification as an emerging technology may be undertaken by authorities other than the regulatory authority.

### **Article 69**

#### **Assessment and approval of requests for classification as an emerging technology**

1. By 12 months of the **expiry of the deadline for transposition** of this Regulation, the relevant regulatory authority shall decide, in coordination with all the other regulatory authorities of a synchronous area, which power-generating modules, if any, should be classified as an emerging tech-

nology. Any regulatory authority of the relevant synchronous area may request a prior opinion from the **Energy Community Regulatory Board**, which shall be issued within three months of receipt of the request. The decision of the relevant regulatory authority shall take into account the opinion of the **Energy Community Regulatory Board**.

2. A list of power-generating modules approved as emerging technologies shall be published by each regulatory authority of a synchronous area.

### **Article 70**

#### **Withdrawal of classification as an emerging technology**

1. From the date of the decision of the regulatory authorities pursuant to Article 69(1), the manufacturer of any power-generating module classified as an emerging technology shall submit to the regulatory authority every two months an update of the sales of the module per **Contracting Party** for the past two months. The regulatory authority shall make publicly available the cumulative maximum capacity of power-generating modules classified as emerging technologies.

2. In the event that the cumulative maximum capacity of all power-generating modules classified as emerging technologies connected to networks exceeds the threshold established in Article 67, the classification as an emerging technology shall be withdrawn by the relevant regulatory authority. The withdrawal decision shall be published.

3. Without prejudice to the provisions of paragraphs 1 and 2, all regulatory authorities of a synchronous area may decide in a coordinated manner to withdraw a classification as an emerging technology. The regulatory authorities of the synchronous area concerned may request a prior opinion from the **Energy Community Regulatory Board** which shall be issued within three months of receipt of the request. Where applicable, the coordinated decision of the regulatory authorities shall take into account the opinion of the **Energy Community Regulatory Board**. The withdrawal decision shall be published by each regulatory authority of a synchronous area.

Power-generating modules classified as emerging technologies and connected to the network prior to the date of withdrawal of that classification as an emerging technology shall be considered as existing power-generating modules and shall therefore only be subject to the requirements of this Regulation pursuant to the provisions of Article 4(2) and Articles 38 and 39.

## **TITLE VII**

### **FINAL PROVISIONS**

#### **Article 71**

#### **Amendment of contracts and general terms and conditions**

1. Regulatory authorities shall ensure that all relevant clauses in contracts and general terms and conditions relating to the grid connection of new power-generating modules are brought into compliance with the requirements of this Regulation.

2. All relevant clauses in contracts and relevant clauses of general terms and conditions relating to the grid connection of existing power-generating modules subject to all or some of the requirements of this Regulation in accordance with Article 4(1) shall be amended in order to comply with the requirements of this Regulation. The relevant clauses shall be amended within three years following the decision of the regulatory authority or **Contracting Party** as referred to in Article 4(1).

3. Regulatory authorities shall ensure that national agreements between system operators and owners of new or existing power-generating facilities subject to this Regulation and relating to grid connection requirements for power-generating facilities, in particular in national network codes, reflect the requirements set out in this Regulation.

## **Article 72**

### **Entry into force<sup>1</sup>**

**1. Each Contracting Party shall transpose Regulation (EU) 2016/631 by no later than by 12 June 2018.**

**2. Transposition shall be made without changes to the structure and text of Regulation (EU) 2016/1447 other than translation and the adaptations made by the present Decision [2018/03/PHLG-EnC].**

**3. Each Contracting Party shall notify the Energy Community Secretariat of completed transposition and of any subsequent changes made to the act transposing Regulation (EU) 2016/1447 within two weeks following the adoption of such measures.**

**4. Articles 4(2) points (a) and (b), 7(4), 58, 59, 61(1), 68(1) and Article 69(1) of Regulation (EU) 2016/631 shall apply as of the expiry of the transposition deadline.**

**5. Without prejudice to paragraph 4, Regulation (EU) 2016/631 shall be implemented no later than by 12 June 2021.**

**6. In transposing this Decision [2018/03/PHLG-EnC], Contracting Parties shall task national regulatory authorities with the monitoring of and enforcing compliance with this Decision [2018/03/PHLG-EnC].**

---

<sup>1</sup> Adapted by Article 1 of Permanent High Level Group Decision 2018/03/PHLG-EnC.

## REGULATION (EU) 2016/1447 of 26 August 2016 establishing a network code on requirements for grid connection of high voltage direct current systems and direct current-connected power park modules

Incorporated and adapted by Permanent High Level Group Decision 2018/04/PHLG-EnC of 12 January 2018

*The adaptations made by Permanent High Level Group Decision 2018/04/PHLG-EnC are highlighted in **bold and blue**.*

Whereas:

(1) The swift completion of a fully functioning and interconnected internal energy market is crucial to maintaining security of energy supply, increasing competitiveness and ensuring that all consumers can purchase energy at affordable prices.

(2) Regulation (EC) No 714/2009 sets out non-discriminatory rules governing access to the network for cross-border exchanges in electricity with a view to ensuring the proper functioning of the internal market in electricity. In addition Article 5 of Directive 2009/72/EC of the European Parliament and of the Council requires that Member States or, where Member States have so provided, regulatory authorities ensure, *inter alia*, that objective and non-discriminatory technical rules are developed which establish minimum technical design and operational requirements for the connection to the system. Where requirements constitute terms and conditions for connection to national networks, Article 37(6) of the same Directive requires regulatory authorities to be responsible for fixing or approving at least the methodologies used to calculate or establish them. In order to provide system security within the interconnected transmission system, it is essential to establish a common understanding of the requirements for High-Voltage Direct Current (HVDC) systems and direct current-connected power park modules (DC-connected power park modules). Those requirements that contribute to maintaining, preserving and restoring system security in order to facilitate proper functioning of the internal electricity market within and between synchronous areas, and to achieve cost efficiencies, should be regarded as cross-border network issues and market integration issues.

(3) Harmonised rules for grid connection for HVDC systems and DC-connected power park modules should be set out in order to provide a clear legal framework for grid connections, facilitate Union-wide trade in electricity, ensure system security, facilitate the integration of renewable electricity sources, increase competition and allow more efficient use of the network and resources, for the benefit of consumers.

(4) System security depends partly on the technical capabilities of HVDC systems and DC-connected power park modules. Therefore regular coordination at the level of the transmission and distribution networks and adequate performance of the equipment connected to the transmission and distribution networks with sufficient robustness to cope with disturbances and to help to prevent any major disruption or to facilitate restoration of the system after a collapse are fundamental prerequisites.

(5) Secure system operation is only possible if there is close cooperation between owners of HVDC systems and DC connected power park modules and system operators. In particular, the functioning of the system under abnormal operating conditions depends on the response of the HVDC systems

and DC-connected power park modules to deviations from the reference 1 per unit (pu) values of voltage and nominal frequency. In the context of system security, the networks and the HVDC systems and DC-connected power park modules should be considered as one entity from a system engineering point of view, given that those parts are interdependent. Therefore, as a prerequisite for grid connection, relevant technical requirements should be set for HVDC systems and DC-connected power park modules.

(6) Regulatory authorities should consider the reasonable costs effectively incurred by system operators in the implementation of this Regulation when fixing or approving transmission or distribution tariffs or their methodologies or when approving the terms and conditions for connection and access to national networks in accordance with Article 37(1) and (6) of Directive 2009/72/EC and with Article 14 of Regulation (EC) No 714/2009.

(7) Different synchronous electricity systems in the Union have different characteristics which need to be taken into account when setting the requirements for HVDC systems and DC-connected power park modules. It is therefore appropriate to consider regional specificities when establishing network connection rules as required by Article 8(6) of Regulation (EC) No 714/2009.

(8) In view of the need to provide regulatory certainty, the requirements of this Regulation should apply to new HVDC systems and new DC-connected power park modules but should not apply to HVDC systems and DC connected power park modules already existing or at an advanced stage of planning but not yet completed unless the relevant regulatory authority or Member State decides otherwise based on evolution of system requirements and a full cost-benefit analysis, or where there has been substantial modernisation of those facilities.

(9) Due to its cross-border impact, this Regulation should aim at the same frequency-related requirements for all voltage levels, at least within a synchronous area. That is necessary because, within a synchronous area, a change in frequency in one Member State would immediately impact frequency and could damage equipment in all other Member States.

(10) To ensure system security, it should be possible for HVDC systems and DC-connected power park modules in each synchronous area of the interconnected system to remain connected to the system for specified frequency and voltage ranges.

(11) Voltage ranges should be coordinated between interconnected systems because they are crucial to secure planning and operation of a power system within a synchronous area. Disconnections because of voltage disturbances have an impact on neighbouring systems. Failure to specify voltage ranges could lead to widespread uncertainty in planning and operation of the system with respect to operation beyond normal operating conditions.

(12) Appropriate and proportionate compliance testing should be introduced so that system operators can ensure operational security. In accordance with Article 37(1)(b) of Directive 2009/72/EC, regulatory authorities are responsible for ensuring that system operators are compliant with this Regulation.

(13) The regulatory authorities, Member States and system operators should ensure that, in the process of developing and approving the requirements for network connection, they are harmonised to the extent possible, in order to ensure full market integration. Established technical standards should be taken into particular consideration in the development of connection requirements.

(14) A process for derogating from the rules should be set out in this Regulation to take into account local circumstances where exceptionally, for example, compliance with those rules could jeopardise

the stability of the local network or where the safe operation of an HVDC system or DC-connected power park module might require operating conditions that are not in line with this Regulation.

(15) In the case of DC-connected power park modules, new modules could, in the future form part of a meshed offshore grid connecting to more than one synchronous area. In this case, certain technical requirements should be set in order to maintain system security and ensure that future meshed networks can be developed costeffectively. However, for certain requirements, DC-connected power park modules should only be required to fit the equipment needed for system security at the time it becomes necessary.

(16) Therefore, the owners of DC-connected power park modules which are, or will be, connected to one synchronous area with a radial connection should have the possibility to apply, via an expedited process, for derogations to requirements that will only be needed where the power park modules become connected to a meshed grid and which take account of case-by-case circumstances. They should also be informed as early as possible whether they qualify for a derogation for the purposes of their investment decision-making.

(17) Subject to approval by the relevant regulatory authority, or other authority where applicable in a Member State, system operators should be allowed to propose derogations for certain classes of HVDC systems and DC connected power park modules.

(18) This Regulation has been adopted on the basis of Regulation (EC) No 714/2009 which it supplements and of which it forms an integral part. References to Regulation (EC) No 714/2009 in other legal acts should be understood as also referring to this Regulation.

(19) The measures provided for in this Regulation are in accordance with the opinion of the Committee referred to in Article 23(1) of Regulation (EC) No 714/2009.

## TITLE I GENERAL PROVISIONS

### *Article 1*

#### **Subject matter**

This Regulation establishes a network code which lays down the requirements for grid connections of high-voltage direct current (HVDC) systems and DC-connected power park modules. It, therefore, helps to ensure fair conditions of competition in the internal electricity market, to ensure system security and the integration of renewable electricity sources, and to facilitate **Energy Community**-wide trade in electricity.

This regulation also lays down the obligations for ensuring that system operators make appropriate use of HVDC systems and DC-connected power park modules capabilities in a transparent and non-discriminatory manner to provide a level playing field throughout the **Energy Community**.

## **Article 2**

### **Definitions**

For the purposes of this Regulation, the definitions in Article 2 of Regulation (EC) No 714/2009, <...>, Article 2 of Commission Regulation (EU) No 543/2013, Article 2 of Commission Regulation (EU) 2016/631, Article 2 of Commission Regulation (EU) 2016/1388 and Article 2 of Directive 2009/72/EC shall apply. In addition, the following definitions shall apply:

- (1) 'HVDC system' means an electrical power system which transfers energy in the form of high-voltage direct current between two or more alternating current (AC) buses and comprises at least two HVDC converter stations with DC transmission lines or cables between the HVDC converter stations;
- (2) 'DC-connected power park module' means a power park module that is connected via one or more HVDC interface points to one or more HVDC systems;
- (3) 'embedded HVDC system' means an HVDC system connected within a control area that is not installed for the purpose of connecting a DC-connected power park module at the time of installation, nor installed for the purpose of connecting a demand facility;
- (4) 'HVDC converter station' means part of an HVDC system which consists of one or more HVDC converter units installed in a single location together with buildings, reactors, filters, reactive power devices, control, monitoring, protective, measuring and auxiliary equipment;
- (5) 'HVDC interface point' means a point at which HVDC equipment is connected to an AC network, at which technical specifications affecting the performance of the equipment can be prescribed;
- (6) 'DC-connected power park module owner' means a natural or legal entity owning a DC-connected power park module;
- (7) 'maximum HVDC active power transmission capacity' ( $P_{\max}$ ) means the maximum continuous active power which an HVDC system can exchange with the network at each connection point as specified in the connection agreement or as agreed between the relevant system operator and the HVDC system owner;
- (8) 'minimum HVDC active power transmission capacity' ( $P_{\min}$ ) means the minimum continuous active power which an HVDC system can exchange with the network at each connection point as specified in the connection agreement or as agreed between the relevant system operator and the HVDC system owner;
- (9) 'HVDC system maximum current' means the highest phase current, associated with an operating point inside the U-Q/ $P_{\max}$ -profile of the HVDC converter station at maximum HVDC active power transmission capacity;
- (10) 'HVDC converter unit' means a unit comprising one or more converter bridges, together with one or more converter transformers, reactors, converter unit control equipment, essential protective and switching devices and auxiliaries, if any, used for the conversion.

### Article 3

#### Scope of application

1. The requirements of this Regulation shall apply to:

- (a) HVDC systems connecting synchronous areas or control areas, including back-to-back schemes;
- (b) HVDC systems connecting power park modules to a transmission network or a distribution network, pursuant to paragraph 2;
- (c) embedded HVDC systems within one control area and connected to the transmission network; and
- (d) embedded HVDC systems within one control area and connected to the distribution network when a cross-border impact is demonstrated by the relevant transmission system operator (TSO). The relevant TSO shall consider the long-term development of the network in this assessment.

2. Relevant system operators, in coordination with relevant TSOs, shall propose to competent regulatory authorities the application of this Regulation for DC-connected power park modules with a single connection point to a transmission network or distribution network which is not part of a synchronous area for approval in accordance with Article 5. All other power park modules which are AC-collected but are DC-connected to a synchronous area are considered DC-connected power park modules and fall within the scope of this Regulation.

3. Articles 55 to 59, 69 to 74 and 84 shall not apply to HVDC systems within one control area referred to in points (c) and (d) of paragraph 1 where:

- (a) the HVDC system has at least one HVDC converter station owned by the relevant TSO;
- (b) the HVDC system is owned by an entity which exercises control over the relevant TSO;
- (c) the HVDC system is owned by an entity directly or indirectly controlled by an entity which also exercises control over the relevant TSO.

4. The connection requirements for HVDC systems provided for in Title II shall apply at the AC connection points of such systems, except the requirements provided for in Article 29(4) and (5) and Article 31(5), which can apply at other connection points, and Article 19(1) which may apply at the terminals of the HVDC converter station.

5. The connection requirements for DC-connected power park modules and remote-end HVDC converter stations provided for in Title III shall apply at the HVDC interface point of such systems, except the requirements provided for in Article 39(1)(a) and Article 47(2), which apply at the connection point in the synchronous area to which frequency response is being provided.

6. The relevant system operator shall refuse to allow the connection of a new HVDC system or DC-connected power park module which does not comply with the requirements set out in this Regulation and which is not covered by a derogation granted by the regulatory authority, or other authority where applicable in a **Contracting Party** pursuant to Title VII. The relevant system operator shall communicate such refusal, by means of a reasoned statement in writing, to the HVDC system owner or DC-connected power park module owner and, unless specified otherwise by the regulatory authority, to the regulatory authority.

7. This Regulation shall not apply to:

- (a) HVDC systems whose connection point is below 110 kV unless a cross-border impact is demonstrat-

ed by the relevant TSO. The relevant TSO shall consider the long-term development of the network in this assessment;

(b) <...>

#### **Article 4**

##### **Application to existing HVDC systems and DC-connected power park modules**

1. Except for Articles 26, 31, 33 and 50, existing HVDC systems and existing DC-connected power park modules are not subject to the requirements of this Regulation, unless:

(a) the HVDC system or DC-connected power park module has been modified to such an extent that its connection agreement must be substantially revised in accordance with the following procedure:

(i) the HVDC system or DC-connected power park module owners who intend to undertake the modernisation of a plant or replacement of equipment impacting the technical capabilities of the HVDC system or DC-connected power park module shall notify their plans to the relevant system operator in advance;

(ii) if the relevant system operator considers that the extent of the modernisation or replacement of equipment is such that a new connection agreement is required, the system operator shall notify the relevant regulatory authority or, where applicable, the **Contracting Party**; and

(iii) the relevant regulatory authority or, where applicable, the **Contracting Party** shall decide if the existing connection agreement needs to be revised or a new connection agreement is required and which requirements of this Regulation shall apply; or

(b) a regulatory authority or, where applicable, a **Contracting Party** decides to make an existing HVDC system or existing DC-connected power park module subject to all or some of the requirements of this Regulation, following a proposal from the relevant TSO in accordance with paragraphs 3, 4 and 5.

2. For the purposes of this Regulation, an HVDC system or DC-connected power park module shall be considered existing if:

(a) it is already connected to the network on the date of **expiry of the deadline for transposition** of this Regulation; or

(b) the HVDC system owner or DC-connected power park module owner has concluded a final and binding contract for the purchase of the main generating plant or HVDC equipment by two years after the **expiry of the deadline for transposition** of the Regulation. The HVDC system owner or DC-connected power park module owner must notify the relevant system operator and relevant TSO of conclusion of the contract within 30 months after the **expiry of the deadline for transposition** of the Regulation.

The notification submitted by the HVDC system owner or DC-connected power park module owner to the relevant system operator and to the relevant TSO shall at least indicate the contract title, its date of signature and date of entry into force and the specifications of the main generating plant or HVDC equipment to be constructed, assembled or purchased.

A **Contracting Party** may provide that in specified circumstances the regulatory authority may determine whether the HVDC system or DC-connected power park module is to be considered an

existing or new HVDC system or DC-connected power park module.

3. Following a public consultation in accordance to Article 8 and in order to address significant factual changes in circumstances, such as the evolution of system requirements including penetration of renewable energy sources, smart grids, distributed generation or demand response, the relevant TSO may propose to the regulatory authority concerned, or where applicable, to the **Contracting Party** to extend the application of this Regulation to existing HVDC systems and/or DC-connected power park modules.

For that purpose a sound and transparent quantitative cost-benefit analysis shall be carried out, in accordance with Articles 65 and 66. The analysis shall indicate:

- (a) the costs, in regard to existing HVDC systems and DC-connected power park modules, of requiring compliance with this Regulation;
- (b) the socioeconomic benefit resulting from applying the requirements set out in this Regulation; and
- (c) the potential of alternative measures to achieve the required performance.

4. Before carrying out the quantitative cost-benefit analysis referred to in paragraph 3, the relevant TSO shall:

- (a) carry out a preliminary qualitative comparison of costs and benefits;
- (b) obtain approval from the relevant regulatory authority or, where applicable, the **Contracting Party**.

5. The relevant regulatory authority or, where applicable, the **Contracting Party** shall decide on the extension of the applicability of this Regulation to existing HVDC systems or DC-connected power park modules within six months of receipt of the report and the recommendation of the relevant TSO in accordance with paragraph 4 of Article 65. The decision of the regulatory authority or, where applicable, the **Contracting Party** shall be published.

6. The relevant TSO shall take account of the legitimate expectations of HVDC system owners and DC-connected power park modules owners as part of the assessment of the application of this Regulation to existing HVDC systems or DC-connected power park modules.

7. The relevant TSO may assess the application of some or all of the provisions of this Regulation to existing HVDC systems or DC-connected power park modules every three years in accordance with the criteria and process set out in paragraphs 3 to 5.

## **Article 5**

### **Regulatory aspects**

1. Requirements of general application to be established by relevant system operators or TSOs under this Regulation shall be subject to approval by the entity designated by the **Contracting Party** and be published. The designated entity shall be the regulatory authority unless otherwise provided by the **Contracting Party**.

2. For site specific requirements to be established by relevant system operators or TSOs under this Regulation, **Contracting Parties** may require approval by a designated entity.

3. When applying this Regulation, **Contracting Parties**, competent entities and system operators shall:
- (a) apply the principles of proportionality and non-discrimination;
  - (b) ensure transparency;
  - (c) apply the principle of optimisation between the highest overall efficiency and lowest total costs for all parties involved;
  - (d) respect the responsibility assigned to the relevant TSO in order to ensure system security, including as required by national legislation;
  - (e) consult with relevant DSOs and take account of potential impacts on their system;
  - (f) take into consideration agreed European standards and technical specifications.
4. The relevant system operator or TSO shall submit a proposal for requirements of general application, or the methodology used to calculate or establish them, for approval by the competent entity within two years of **expiry of the deadline for transposition** of this Regulation.
5. Where this Regulation requires the relevant system operator, relevant TSO, HVDC system owner, DC-connected power park module owner and/or the distribution system operator to seek agreement, they shall endeavour to do so within six months after a first proposal has been submitted by one party to the other parties. If no agreement has been found within this timeframe, each party may request the relevant regulatory authority to issue a decision within six months.
6. Competent entities shall take decisions on proposals for requirements or methodologies within six months following the receipt of such proposals.
7. If the relevant system operator or TSO deems an amendment to requirements or methodologies as provided for and approved under paragraph 1 and 2 to be necessary, the requirements provided for in paragraphs 3 to 8 shall apply to the proposed amendment. System operators and TSOs proposing an amendment shall take into account the legitimate expectations, if any, of HVDC system owners, DC-connected power park module owners, equipment manufacturers and other stakeholders based on the initially specified or agreed requirements or methodologies.
8. Any party having a complaint against a relevant system operator or TSO in relation to that relevant system operator's or TSO's obligations under this Regulation may refer the complaint to the regulatory authority which, acting as dispute settlement authority, shall issue a decision within two months after receipt of the complaint. That period may be extended by two months where additional information is sought by the regulatory authority. That extended period may be further extended with the agreement of the complainant. The regulatory authority's decision shall have binding effect unless and until overruled on appeal.
9. Where the requirements under this Regulation are to be established by a relevant system operator that is not a TSO, **Contracting Parties** may provide that instead the TSO be responsible for establishing the relevant requirements.

## **Article 6**

### **Multiple TSOs**

1. Where more than one TSO exists in a **Contracting Party**, this Regulation shall apply to all those

TSOs.

2. **Contracting Parties** may, under the national regulatory regime, provide that the responsibility of a TSO to comply with one or some or all obligations under this Regulation is assigned to one or more specific TSOs.

### **Article 7**

#### **Recovery of costs**

1. The costs borne by system operators subject to network tariff regulation and stemming from the obligations laid down in this Regulation shall be assessed by the relevant regulatory authorities. Costs assessed as reasonable, efficient and proportionate shall be recovered through network tariffs or other appropriate mechanisms.

2. If requested by the relevant regulatory authorities, system operators referred to in paragraph 1 shall, within three months of the request, provide the information necessary to facilitate assessment of the costs incurred.

### **Article 8**

#### **Public consultation**

1. Relevant system operators and relevant TSOs shall carry out consultation with stakeholders, including the competent authorities of each **Contracting Party**, on proposals to extend the applicability of this Regulation to existing HVDC systems and DC-connected power park modules, in accordance with Article 4(3), on the report prepared in accordance with Article 65(3), and the cost-benefit analysis undertaken in accordance with Article 80(2). The consultation shall last at least for a period of one month.

2. The relevant system operators or relevant TSOs shall duly take into account the views of the stakeholders resulting from the consultations prior to the submission of the draft proposal or the report or cost benefit analysis for approval by the regulatory authority or, if applicable, the **Contracting Party**. In all cases, a sound justification for including or not the views of the stakeholders shall be provided and published in a timely manner before, or simultaneously with, the publication of the proposal.

### **Article 9**

#### **Stakeholder involvement**

The **Energy Community Regulatory Board**, in close cooperation with the European Network of Transmission System Operators for Electricity (ENTSO for Electricity), shall organise stakeholder involvement regarding the requirements for grid connection of HVDC systems and DC-connected power park modules, and other aspects of the implementation of this Regulation. This shall include regular meetings with stakeholders to identify problems and propose improvements notably related to the requirements for grid connection of HVDC systems and DC-connected power park modules.

### **Article 10**

#### **Confidentiality obligations**

1. Any confidential information received, exchanged or transmitted pursuant to this Regulation shall be subject to the conditions of professional secrecy laid down in paragraphs 2, 3 and 4.
2. The obligation of professional secrecy shall apply to any persons, regulatory authorities or entities subject to the provisions of this Regulation.
3. Confidential information received by the persons, regulatory authorities or entities referred to in paragraph 2 in the course of their duties may not be divulged to any other person or authority, without prejudice to cases covered by national law, the other provisions of this Regulation or other relevant **Energy Community** law.
4. Without prejudice to cases covered by national or **Energy Community** law, regulatory authorities, entities or persons who receive confidential information pursuant to this Regulation may use it only for the purpose of carrying out their duties under this Regulation.

## **TITLE II**

### **GENERAL REQUIREMENTS FOR HVDC CONNECTIONS**

#### **CHAPTER 1**

#### **Requirements for active power control and frequency support**

### **Article 11**

#### **Frequency ranges**

1. An HVDC system shall be capable of staying connected to the network and remaining operable within the frequency ranges and time periods specified in Table 1, Annex I for the short circuit power range as specified in Article 32(2).
2. The relevant TSO and HVDC system owner may agree on wider frequency ranges or longer minimum times for operation if needed to preserve or to restore system security. If wider frequency ranges or longer minimum times for operation are economically and technically feasible, the HVDC system owner shall not unreasonably withhold consent.
3. Without prejudice to paragraph 1, an HVDC system shall be capable of automatic disconnection at frequencies specified by the relevant TSO.
4. The relevant TSO may specify a maximum admissible active power output reduction from its operating point if the system frequency falls below 49 Hz.

**Article 12****Rate-of-change-of-frequency withstand capability**

An HVDC system shall be capable of staying connected to the network and operable if the network frequency changes at a rate between  $- 2,5$  and  $+ 2,5$  Hz/s (measured at any point in time as an average of the rate of change of frequency for the previous 1 s).

**Article 13****Active power controllability, control range and ramping rate**

1. With regard to the capability of controlling the transmitted active power:

(a) an HVDC system shall be capable of adjusting the transmitted active power up to its maximum HVDC

active power transmission capacity in each direction following an instruction from the relevant TSO.

The relevant TSO:

(i) may specify a maximum and minimum power step size for adjusting the transmitted active power;

(ii) may specify a minimum HVDC active power transmission capacity for each direction, below which active power transmission capability is not requested; and

(iii) shall specify the maximum delay within which the HVDC system shall be capable of adjusting the transmitted active power upon receipt of request from the relevant TSO.

(b) the relevant TSO shall specify how an HVDC system shall be capable of modifying the transmitted active power infeed in case of disturbances into one or more of the AC networks to which it is connected. If the initial delay prior to the start of the change is greater than 10 milliseconds from receiving the triggering signal sent by the relevant TSO, it shall be reasonably justified by the HVDC system owner to the relevant TSO.

(c) the relevant TSO may specify that an HVDC system be capable of fast active power reversal. The power reversal shall be possible from the maximum active power transmission capacity in one direction to the maximum active power transmission capacity in the other direction as fast as technically feasible and reasonably justified by the HVDC system owner to the relevant TSOs if greater than 2 seconds.

(d) for HVDC systems linking various control areas or synchronous areas, the HVDC system shall be equipped with control functions enabling the relevant TSOs to modify the transmitted active power for the purpose of cross-border balancing.

2. An HVDC system shall be capable of adjusting the ramping rate of active power variations within its technical capabilities in accordance with instructions sent by relevant TSOs. In case of modification of active power according to points (b) and (c) of paragraph 1, there shall be no adjustment of ramping rate.

3. If specified by a relevant TSO, in coordination with adjacent TSOs, the control functions of an HVDC system shall be capable of taking automatic remedial actions including, but not limited to,

stopping the ramping and blocking FSM, LFSM-O, LFSM-U and frequency control. The triggering and blocking criteria shall be specified by relevant TSO and subject to notification to the regulatory authority. The modalities of that notification shall be determined in accordance with the applicable national regulatory framework.

#### **Article 14**

##### **Synthetic inertia**

1. If specified by a relevant TSO, an HVDC system shall be capable of providing synthetic inertia in response to frequency changes, activated in low and/or high frequency regimes by rapidly adjusting the active power injected to or withdrawn from the AC network in order to limit the rate of change of frequency. The requirement shall at least take account of the results of the studies undertaken by TSOs to identify if there is a need to set out minimum inertia.
2. The principle of this control system and the associated performance parameters shall be agreed between the relevant TSO and the HVDC system owner.

#### **Article 15**

##### **Requirements relating to frequency sensitive mode, limited frequency sensitive mode overfrequency and limited frequency sensitive mode underfrequency**

Requirements applying to frequency sensitive mode, limited frequency sensitive mode overfrequency and limited frequency sensitive mode underfrequency shall be as set out in Annex II.

#### **Article 16**

##### **Frequency control**

1. If specified by the relevant TSO, an HVDC system shall be equipped with an independent control mode to modulate the active power output of the HVDC converter station depending on the frequencies at all connection points of the HVDC system in order to maintain stable system frequencies.
2. The relevant TSO shall specify the operating principle, the associated performance parameters and the activation criteria of the frequency control referred to in paragraph 1.

#### **Article 17**

##### **Maximum loss of active power**

1. An HVDC system shall be configured in such a way that its loss of active power injection in a synchronous area shall be limited to a value specified by the relevant TSOs for their respective load frequency control area, based on the HVDC system's impact on the power system.

2. Where an HVDC system connects two or more control areas, the relevant TSOs shall consult each other in order to set a coordinated value of the maximum loss of active power injection as referred to in paragraph 1, taking into account common mode failures.

## CHAPTER 2

### Requirements for reactive power control and voltage support

#### *Article 18*

#### Voltage ranges

1. Without prejudice to Article 25, an HVDC converter station shall be capable of staying connected to the network and capable of operating at HVDC system maximum current, within the ranges of the network voltage at the connection point, expressed by the voltage at the connection point related to reference 1 pu voltage, and the time periods specified in Tables 4 and 5, Annex III. The establishment of the reference 1 pu voltage shall be subject to coordination between the adjacent relevant system operators.

2. The HVDC system owner and the relevant system operator, in coordination with the relevant TSO, may agree on wider voltage ranges or longer minimum times for operation than those specified in paragraph 1 in order to ensure the best use of the technical capabilities of an HVDC system if needed to preserve or to restore system security. If wider voltage ranges or longer minimum times for operation are economically and technically feasible, the HVDC system owner shall not unreasonably withhold consent.

3. An HVDC converter station shall be capable of automatic disconnection at connection point voltages specified by the relevant system operator, in coordination with the relevant TSO. The terms and settings for automatic disconnection shall be agreed between the relevant system operator, in coordination with the relevant TSO, and the HVDC system owner.

4. For connection points at reference 1 pu AC voltages not included in the scope set out in Annex III, the relevant system operator, in coordination with relevant TSOs, shall specify applicable requirements at the connection points.

5. Notwithstanding the provisions of paragraph 1, the relevant TSOs in **Moldova and Ukraine shall**, following consultation with relevant neighbouring TSOs, require HVDC converter stations to **operate** in the voltage ranges and for time periods that apply in the Continental Europe synchronous area.

#### *Article 19*

#### Short circuit contribution during faults

1. If specified by the relevant system operator, in coordination with the relevant TSO, an HVDC system shall have the capability to provide fast fault current at a connection point in case of symmetrical (3-phase) faults.

2. Where an HVDC system is required to have the capability referred to in paragraph 1, the relevant system operator, in coordination with the relevant TSO, shall specify the following:
  - (a) how and when a voltage deviation is to be determined as well as the end of the voltage deviation;
  - (b) the characteristics of the fast fault current;
  - (c) the timing and accuracy of the fast fault current, which may include several stages.
3. The relevant system operator, in coordination the relevant TSO, may specify a requirement for asymmetrical current injection in the case of asymmetrical (1-phase or 2-phase) faults.

### **Article 20**

#### **Reactive power capability**

1. The relevant system operator, in coordination with the relevant TSO, shall specify the reactive power capability requirements at the connection points, in the context of varying voltage. The proposal for those requirements shall include a  $U-Q/P_{\max}$ -profile, within the boundary of which the HVDC converter station shall be capable of providing reactive power at its maximum HVDC active power transmission capacity.
2. The  $U-Q/P_{\max}$ -profile referred to in paragraph 1 shall comply with the following principles:
  - (a) the  $U-Q/P_{\max}$ -profile shall not exceed the  $U-Q/P_{\max}$ -profile envelope represented by the inner envelope in the figure set out in Annex IV, and does not need to be rectangular;
  - (b) the dimensions of the  $U-Q/P_{\max}$ -profile envelope shall respect the values established for each synchronous area in the table set out in Annex IV. **The dimensions of the profile envelope applied in Moldova and Ukraine shall correspond to the values that apply in the Continental Europe synchronous area;** and
  - (c) the position of the  $U-Q/P_{\max}$ -profile envelope shall lie within the limits of the fixed outer envelope in the figure set out in Annex IV.
3. An HVDC system shall be capable of moving to any operating point within its  $U-Q/P_{\max}$  profile in timescales specified by the relevant system operator in coordination with the relevant TSO.
4. When operating at an active power output below the maximum HVDC active power transmission capacity ( $P < P_{\max}$ ), the HVDC converter station shall be capable of operating in every possible operating point, as specified by the relevant system operator in coordination with the relevant TSO and in accordance with the reactive power capability set out by the  $U-Q/P_{\max}$  profile specified in paragraphs 1 to 3.

### **Article 21**

#### **Reactive power exchanged with the network**

1. The HVDC system owner shall ensure that the reactive power of its HVDC converter station exchanged with the network at the connection point is limited to values specified by the relevant system operator in coordination with the relevant TSO.
2. The reactive power variation caused by the reactive power control mode operation of the HVDC

converter Station, referred to in Article 22(1), shall not result in a voltage step exceeding the allowed value at the connection point. The relevant system operator, in coordination with the relevant TSO, shall specify this maximum tolerable voltage step value.

## **Article 22**

### **Reactive power control mode**

1. An HVDC converter station shall be capable of operating in one or more of the three following control modes, as specified by the relevant system operator in coordination with the relevant TSO:

- (a) voltage control mode;
- (b) reactive power control mode;
- (c) power factor control mode.

2. An HVDC converter station shall be capable of operating in additional control modes specified by the relevant system operator in coordination with the relevant TSO.

3. For the purposes of voltage control mode, each HVDC converter station shall be capable of contributing to voltage control at the connection point utilising its capabilities, while respecting Articles 20 and 21, in accordance with the following control characteristics:

- (a) a setpoint voltage at the connection point shall be specified to cover a specific operation range, either continuously or in steps, by the relevant system operator, in coordination with the relevant TSO;
- (b) the voltage control may be operated with or without a deadband around the setpoint selectable in a range from zero to  $\pm 5\%$  of reference 1 pu network voltage. The deadband shall be adjustable in steps as specified by the relevant system operator in coordination with the relevant TSO;
- (c) following a step change in voltage, the HVDC converter station shall be capable of:

- (i) achieving 90% of the change in reactive power output within a time  $t_1$  specified by the relevant system operator in coordination with the relevant TSO. The time  $t_1$  shall be in the range of 0,1-10 seconds; and
- (ii) settling at the value specified by the operating slope within a time  $t_2$  specified by the relevant system operator in coordination with the relevant TSO. The time  $t_2$  shall be in the range of 1-60 seconds, with a specified steady-state tolerance given in % of the maximum reactive power.

(d) voltage control mode shall include the capability to change reactive power output based on a combination of a modified setpoint voltage and an additional instructed reactive power component. The slope shall be specified by a range and step specified by the relevant system operator in coordination with the relevant TSO.

4. With regard to reactive power control mode, the relevant system operator shall specify a reactive power range in MVar or in % of maximum reactive power, as well as its associated accuracy at the connection point, using the capabilities of the HVDC system, while respecting Articles 20 and 21.

5. For the purposes of power factor control mode, the HVDC converter station shall be capable of controlling the power factor to a target at the connection point, while respecting Articles 20 and 21. The available setpoints shall be available in steps no greater than a maximum allowed step specified

by the relevant system operator.

6. The relevant system operator in coordination with the relevant TSO shall specify any equipment needed to enable the remote selection of control modes and relevant setpoints.

### **Article 23**

#### **Priority to active or reactive power contribution**

Taking into account the capabilities of the HVDC system specified in accordance with this Regulation, the relevant TSO shall determine whether active power contribution or reactive power contribution shall have priority during low or high voltage operation and during faults for which fault-ride-through capability is required. If priority is given to active power contribution, its provision shall be established within a time from the fault inception as specified by relevant TSO.

### **Article 24**

#### **Power quality**

An HVDC system owner shall ensure that its HVDC system connection to the network does not result in a level of distortion or fluctuation of the supply voltage on the network, at the connection point, exceeding the level specified by the relevant system operator in coordination with the relevant TSO. The process for necessary studies to be conducted and relevant data to be provided by all grid users involved, as well as mitigating actions identified and implemented, shall be in accordance with the process in Article 29.

## **CHAPTER 3**

### **Requirements for fault ride through capability**

#### **Article 25**

##### **Fault ride through capability**

1. The relevant TSO shall specify, while respecting Article 18, a voltage-against time profile as set out in Annex V and having regard to the voltage-against-time-profile specified for power park modules according to Regulation (EU) 2016/631. This profile shall apply at connection points for fault conditions, under which the HVDC converter station shall be capable of staying connected to the network and continuing stable operation after the power system has recovered following fault clearance. The voltage-against-time-profile shall express a lower limit of the actual course of the phase-to-phase voltages on the network voltage level at the connection point during a symmetrical fault, as a function of time before, during and after the fault. Any ride through period beyond  $t_{rec2}$  shall be specified by the relevant TSO consistent with Article 18.

2. On request by the HVDC system owner, the relevant system operator shall provide the pre-fault

and post-fault conditions as provided for in Article 32 regarding:

- (a) pre-fault minimum short circuit capacity at each connection point expressed in MVA;
- (b) pre-fault operating point of the HVDC converter station expressed as active power output and reactive power output at the connection point and voltage at the connection point; and
- (c) post-fault minimum short circuit capacity at each connection point expressed in MVA.

Alternatively, generic values for the above conditions derived from typical cases may be provided by the relevant system operator.

3. The HVDC converter station shall be capable of staying connected to the network and continue stable operation when the actual course of the phase-to-phase voltages on the network voltage level at the connection point during a symmetrical fault, given the pre-fault and post-fault conditions provided for in Article 32, remain above the lower limit set out in the figure in Annex V, unless the protection scheme for internal faults requires the disconnection of the HVDC converter station from the network. The protection schemes and settings for internal faults shall be designed not to jeopardise fault-ride-through performance.

4. The relevant TSO may specify voltages (Ublock) at the connection points under specific network conditions whereby the HVDC system is allowed to block. Blocking means remaining connected to the network with no active and reactive power contribution for a time frame that shall be as short as technically feasible and which shall be agreed between the relevant TSOs and the HVDC system owner.

5. In accordance Article 34, undervoltage protection shall be set by the HVDC system owner to the widest possible technical capability of the HVDC converter station. The relevant system operator, in coordination with the relevant TSO, may specify narrower settings pursuant to Article 34.

6. The relevant TSO shall specify fault-ride-through capabilities in case of asymmetrical faults.

### **Article 26**

#### **Post fault active power recovery**

The relevant TSO shall specify the magnitude and time profile of active power recovery that the HVDC system shall be capable of providing, in accordance with Article 25.

### **Article 27**

#### **Fast recovery from DC faults**

HVDC systems, including DC overhead lines, shall be capable of fast recovery from transient faults within the HVDC system. Details of this capability shall be subject to coordination and agreements on protection schemes and settings pursuant to Article 34.

## CHAPTER 4

### Requirements for control

#### *Article 28*

#### **Energisation and synchronisation of HVDC converter stations**

Unless otherwise instructed by the relevant system operator, during the energisation or synchronisation of an HVDC converter station to the AC network or during the connection of an energised HVDC converter station to an HVDC system, the HVDC converter station shall have the capability to limit any voltage changes to a steady-state level specified by the relevant system operator in coordination with the relevant TSO. The level specified shall not exceed 5 per cent of the pre-synchronisation voltage. The relevant system operator, in coordination with the relevant TSO, shall specify the maximum magnitude, duration and measurement window of the voltage transients.

#### *Article 29*

#### **Interaction between HVDC systems or other plants and equipment**

1. When several HVDC converter stations or other plants and equipment are within close electrical proximity, the relevant TSO may specify that a study is required, and the scope and extent of that study, to demonstrate that no adverse interaction will occur. If adverse interaction is identified, the studies shall identify possible mitigating actions to be implemented to ensure compliance with the requirements of this Regulation.
2. The studies shall be carried out by the connecting HVDC system owner with the participation of all other parties identified by the TSOs as relevant to each connection point. **Contracting Parties** may provide that the responsibility for undertaking the studies in accordance with this Article lies with the TSO. All parties shall be informed of the results of the studies.
3. All parties identified by the relevant TSO as relevant to each connection point, including the relevant TSO, shall contribute to the studies and shall provide all relevant data and models as reasonably required to meet the purposes of the studies. The relevant TSO shall collect this input and, where applicable, pass it on to the party responsible for the studies in accordance with Article 10.
4. The relevant TSO shall assess the result of the studies based on their scope and extent as specified in accordance with paragraph 1. If necessary for the assessment, the relevant TSO may request the HVDC system owner to perform further studies in line with the scope and extent specified in accordance with paragraph 1.
5. The relevant TSO may review or replicate some or all of the studies. The HVDC system owner shall provide the relevant TSO all relevant data and models that allow such study to be performed.
6. Any necessary mitigating actions identified by the studies carried out in accordance with paragraphs 2 to 5 and reviewed by the relevant TSO shall be undertaken by the HVDC system owner as part of the connection of the new HVDC converter station.
7. The relevant TSO may specify transient levels of performance associated with events for the in-

dividual HVDC system or collectively across commonly impacted HVDC systems. This specification may be provided to protect the integrity of both TSO equipment and that of grid users in a manner consistent with its national code.

### **Article 30**

#### **Power oscillation damping capability**

The HVDC system shall be capable of contributing to the damping of power oscillations in connected AC networks. The control system of the HVDC system shall not reduce the damping of power oscillations. The relevant TSO shall specify a frequency range of oscillations that the control scheme shall positively damp and the network conditions when this occurs, at least accounting for any dynamic stability assessment studies undertaken by TSOs to identify the stability limits and potential stability problems in their transmission systems. The selection of the control parameter settings shall be agreed between the relevant TSO and the HVDC system owner.

### **Article 31**

#### **Subsynchronous torsional interaction damping capability**

1. With regard to subsynchronous torsional interaction (SSTI) damping control, the HVDC system shall be capable of contributing to electrical damping of torsional frequencies.
2. The relevant TSO shall specify the necessary extent of SSTI studies and provide input parameters, to the extent available, related to the equipment and relevant system conditions in its network. The SSTI studies shall be provided by the HVDC system owner. The studies shall identify the conditions, if any, where SSTI exists and propose any necessary mitigation procedure. **Contracting Parties** may provide that the responsibility for undertaking the studies in accordance with this Article lies with the TSO. All parties shall be informed of the results of the studies.
3. All parties identified by the relevant TSO as relevant to each connection point, including the relevant TSO, shall contribute to the studies and shall provide all relevant data and models as reasonably required to meet the purposes of the studies. The relevant TSO shall collect this input and, where applicable, pass it on to the party responsible for the studies in accordance with Article 10.
4. The relevant TSO shall assess the result of the SSTI studies. If necessary for the assessment, the relevant TSO may request that the HVDC system owner perform further SSTI studies in line with this same scope and extent.
5. The relevant TSO may review or replicate the study. The HVDC system owner shall provide the relevant TSO all relevant data and models that allow such study to be performed.
6. Any necessary mitigating actions identified by the studies carried out in accordance with paragraphs 2 or 4, and reviewed by the relevant TSOs, shall be undertaken by the HVDC system owner as part of the connection of the new HVDC converter station.

### **Article 32**

#### **Network characteristics**

1. The relevant system operator shall specify and make publicly available the method and the pre-fault and post-fault conditions for the calculation of at least the minimum and maximum short circuit power at the connection points.
2. The HVDC system shall be capable of operating within the range of short circuit power and network characteristics specified by the relevant system operator.
3. Each relevant system operator shall provide the HVDC system owner with network equivalents describing the behaviour of the network at the connection point, enabling the HVDC system owners to design their system with regard to at least, but not limited to, harmonics and dynamic stability over the lifetime of the HVDC system.

### **Article 33**

#### **HVDC system robustness**

1. The HVDC system shall be capable of finding stable operation points with a minimum change in active power flow and voltage level, during and after any planned or unplanned change in the HVDC system or AC network to which it is connected. The relevant TSO shall specify the changes in the system conditions for which the HVDC systems shall remain in stable operation.
2. The HVDC system owner shall ensure that the tripping or disconnection of an HVDC converter station, as part of any multi-terminal or embedded HVDC system, does not result in transients at the connection point beyond the limit specified by the relevant TSO.
3. The HVDC system shall withstand transient faults on HVAC lines in the network adjacent or close to the HVDC system, and shall not cause any of the equipment in the HVDC system to disconnect from the network due to auto-reclosure of lines in the network.
4. The HVDC system owner shall provide information to the relevant system operator on the resilience of the HVDC system to AC system disturbances.

## **CHAPTER 5**

### **Requirements for protection devices and settings**

#### **Article 34**

##### **Electrical protection schemes and settings**

1. The relevant system operator shall specify, in coordination with the relevant TSO, the schemes and settings necessary to protect the network taking into account the characteristics of the HVDC system. Protection schemes relevant for the HVDC system and the network, and settings relevant for the HVDC system, shall be coordinated and agreed between the relevant system operator, the

relevant TSO and the HVDC system owner. The protection schemes and settings for internal electrical faults shall be designed so as not to jeopardise the performance of the HVDC system in accordance with this Regulation.

2. Electrical protection of the HVDC system shall take precedence over operational controls taking into account system security, health and safety of staff and the public and mitigation of the damage to the HVDC system.

3. Any change to the protection schemes or their settings relevant to the HVDC system and the network shall be agreed between the relevant system operator, the relevant TSO and the HVDC system owner before being implemented by the HVDC system owner.

### **Article 35**

#### **Priority ranking of protection and control**

1. A control scheme, specified by the HVDC system owner consisting of different control modes, including the settings of the specific parameters, shall be coordinated and agreed between the relevant TSO, the relevant system operator and the HVDC system owner.

2. With regard to priority ranking of protection and control, the HVDC system owner shall organise its protections and control devices in compliance with the following priority ranking, listed in decreasing order of importance, unless otherwise specified by the relevant TSOs, in coordination with the relevant system operator:

- (a) network system and HVDC system protection;
- (b) active power control for emergency assistance;
- (c) synthetic inertia, if applicable;
- (d) automatic remedial actions as specified in Article 13(3);
- (e) LFSM;
- (f) FSM and frequency control; and
- (g) power gradient constraint.

### **Article 36**

#### **Changes to protection and control schemes and settings**

1. The parameters of the different control modes and the protection settings of the HVDC system shall be able to be changed in the HVDC converter station, if required by the relevant system operator or the relevant TSO, and in accordance with paragraph 3.

2. Any change to the schemes or settings of parameters of the different control modes and protection of the HVDC system, including the procedure, shall be coordinated and agreed between the relevant system operator, the relevant TSO and the HVDC system owner.

3. The control modes and associated setpoints of the HVDC system shall be capable of being changed

remotely, as specified by the relevant system operator, in coordination with the relevant TSO.

## **CHAPTER 6**

### **Requirements for power system restoration**

#### ***Article 37***

##### **Black start**

1. The relevant TSO may obtain a quote for black start capability from an HVDC system owner.
2. An HVDC system with black start capability shall be able, in case one converter station is energised, to energise the busbar of the AC-substation to which another converter station is connected, within a timeframe after shut down of the HVDC system determined by the relevant TSOs. The HVDC system shall be able to synchronise within the frequency limits set out in Article 11 and within the voltage limits specified by the relevant TSO or as provided for in Article 18, where applicable. Wider frequency and voltage ranges can be specified by the relevant TSO where needed in order to restore system security.
3. The relevant TSO and the HVDC system owner shall agree on the capacity and availability of the black start capability and the operational procedure.

## **TITLE III**

### **REQUIREMENTS FOR DC-CONNECTED POWER PARK MODULES AND REMOTE-END HVDC CONVERTER STATIONS**

## **CHAPTER 1**

### **Requirements for DC-connected power park modules**

#### ***Article 38***

##### **Scope**

The requirements applicable to offshore power park modules under Articles 13 to 22 of Regulation (EU) 2016/631 shall apply to DC-connected power park modules subject to specific requirements provided for in Articles 41 to 45 of this Regulation. These requirements shall apply at the HVDC interface points of the DC-connected power park module and the HVDC systems. The categorisation in Article 5 of Regulation (EU) 2016/631 shall apply to DC-connected power park modules.

#### ***Article 39***

##### **Frequency stability requirements**

1. With regards to frequency response:

(a) a DC-connected power park module shall be capable of receiving a fast signal from a connection point in the synchronous area to which frequency response is being provided, and be able to process this signal within 0,1 second from sending to completion of processing the signal for activation of the response. Frequency shall be measured at the connection point in the synchronous area to which frequency response is being provided;

(b) DC-connected power park modules connected via HVDC systems which connect with more than one control area shall be capable of delivering coordinated frequency control as specified by the relevant TSO.

2. With regard to frequency ranges and response:

(a) a DC-connected power park module shall be capable of staying connected to the remote-end HVDC converter station network and operating within the frequency ranges and time periods specified in Annex VI for the 50 Hz nominal system. Where a nominal frequency other than 50 Hz, or a frequency variable by design is used, subject to agreement with the relevant TSO, the applicable frequency ranges and time periods shall be specified by the relevant TSO taking into account specificities of the system and the requirements set out in Annex VI;

(b) wider frequency ranges or longer minimum times for operation can be agreed between the relevant TSO and the DC-connected power park module owner to ensure the best use of the technical capabilities of a DC-connected power park module if needed to preserve or to restore system security. If wider frequency ranges or longer minimum times for operation are economically and technically feasible, the DC-connected power park module owner shall not unreasonably withhold consent;

(c) while respecting the provisions of point (a) of paragraph 2, a DC-connected power park module shall be capable of automatic disconnection at specified frequencies, if specified by the relevant TSO. Terms and settings for automatic disconnection shall be agreed between the relevant TSO and the DC-connected power park module owner.

3. With regards to rate-of-change-of-frequency withstand capability, a DC-connected power park module shall be capable of staying connected to the remote-end HVDC converter station network and operable if the system frequency changes at a rate up to  $\pm 2$  Hz/s (measured at any point in time as an average of the rate of change of frequency for the previous 1 second) at the HVDC interface point of the DC-connected power park module at the remote end HVDC converter station for the 50 Hz nominal system.

4. DC-connected power park modules shall have limited frequency sensitive mode — overfrequency (LFSM-O) capability in accordance with Article 13(2) of Regulation (EU) 2016/631, subject to fast signal response as specified in paragraph 1 for the 50 Hz nominal system.

5. A capability for DC-connected power park modules to maintain constant power shall be determined in accordance with Article 13(3) of Regulation (EU) 2016/631 for the 50 Hz nominal system.

6. A capability for active power controllability of DC-connected power park modules shall be determined in accordance with Article 15(2)(a) of Regulation (EU) 2016/631 for the 50 Hz nominal system. Manual control shall be possible in the case that remote automatic control devices are out of service.

7. A capability for limited frequency sensitive mode — underfrequency (LFSM-U) for a DC-connected power park module shall be determined in accordance with Article 15(2)(c) of Regulation (EU) 2016/631, subject to fast signal response as specified in paragraph 1 for the 50 Hz nominal system.

8. A capability for frequency sensitive mode for a DC-connected power park module shall be determined in accordance with Article 15(2)(d) of Regulation (EU) 2016/631, subject to a fast signal response as specified in paragraph 1 for the 50 Hz nominal system.

9. A capability for frequency restoration for a DC-connected power park module shall be determined in accordance with Article 15(2)(e) of Regulation (EU) 2016/631 for the 50 Hz nominal system.

10. Where a constant nominal frequency other than 50 Hz, a frequency variable by design or a DC system voltage is used, subject to the agreement of the relevant TSO, the capabilities listed in paragraphs 3 to 9 and the parameters associated with such capabilities shall be specified by the relevant TSO.

### **Article 40**

#### **Reactive power and voltage requirements**

1. With respect to voltage ranges:

(a) a DC-connected power park module shall be capable of staying connected to the remote-end HVDC converter station network and operating within the voltage ranges (per unit), for the time periods specified in Tables 9 and 10, Annex VII. The applicable voltage range and time periods specified are selected based on the reference 1 pu voltage;

(b) wider voltage ranges or longer minimum times for operation can be agreed between the relevant system operator, the relevant TSO and the DC-connected power park module owner to ensure the best use of the technical capabilities of a DC-connected power park module if needed to preserve or to restore system security. If wider voltage ranges or longer minimum times for operation are economically and technically feasible, the DC-connected power park module owner shall not unreasonably withhold consent;

(c) for DC-connected power park modules which have an HVDC interface point to the remote-end HVDC converter station network, the relevant system operator, in coordination with the relevant TSO may specify voltages at the HVDC interface point at which a DC-connected power park module shall be capable of automatic disconnection. The terms and settings for automatic disconnection shall be agreed between the relevant system operator, the relevant TSO and the DC-connected power park module owner;

(d) for HVDC interface points at AC voltages that are not included in the scope of Annex VII, the relevant system operator, in coordination with the relevant TSO shall specify applicable requirements at the connection point;

(e) where frequencies other than nominal 50 Hz are used, subject to relevant TSO agreement, the voltage ranges and time periods specified by the relevant system operator, in coordination with the relevant TSO, shall be proportional to those in Tables 9 and 10, Annex VII.

2. With respect to reactive power capability for DC-connected power park modules:

(a) if the DC-connected power park module owner can obtain a bilateral agreement with the owners of the HVDC systems connecting the DC-connected power park module to a single connection point on a AC network, it shall fulfil all of the following requirements:

(i) it shall have the ability with additional plant or equipment and/or software, to meet the reactive

power capabilities prescribed by the relevant system operator, in coordination with the relevant TSO, according to point (b), and it shall either:

- have the reactive power capabilities for some or all of its equipment in accordance with point (b) already installed as part of the connection of the DC-connected power park module to the AC network at the time of initial connection and commissioning; or
- demonstrate to, and then reach agreement with, the relevant system operator and the relevant TSO on how the reactive power capability will be provided when the DC-connected power park module is connected to more than a single connection point in the AC network, or the AC network at the remote-end HVDC converter station network has either another DC-connected power park module or HVDC system with a different owner connected to it. This agreement shall include a contract by the DC-connected power park module owner (or any subsequent owner), that it will finance and install reactive power capabilities required by this Article for its power park modules at a point in time specified by the relevant system operator, in coordination with the relevant TSO. The relevant system operator, in coordination with the relevant TSO shall inform the DC-connected power park module owner of the proposed completion date of any committed development which will require the DC-connected power park module owner to install the full reactive power capability.

(ii) the relevant system operator, in coordination with the relevant TSO shall account for the development time schedule of retrofitting the reactive power capability to the DC-connected power park module in specifying the point in time by which this reactive power capability retrofitting is to take place. The development time schedule shall be provided by the DC-connected power park module owner at the time of connection to the AC network.

(b) DC-connected power park modules shall fulfil the following requirements relating to voltage stability either at the time of connection or subsequently, according to the agreement as referred to in point (a):

(i) with regard to reactive power capability at maximum HVDC active power transmission capacity, DC-connected power park modules shall meet the reactive power provision capability requirements specified by the relevant system operator, in coordination with the relevant TSO, in the context of varying voltage. The relevant system operator shall specify a  $U-Q/P_{\max}$ -profile that may take any shape with ranges in accordance with Table 11, Annex VII, within which the DC-connected power park module shall be capable of providing reactive power at its maximum HVDC active power transmission capacity. The relevant system operator, in coordination with the relevant TSO, shall consider the long term development of the network when determining these ranges, as well as the potential costs for power park modules of delivering the capability of providing reactive power production at high voltages and reactive power consumption at low voltages.

If the Ten-Year Network Development Plan, where applicable, or a national plan developed and approved in accordance with Article 22 of Directive 2009/72/EC specifies that a DC-connected power park module will become AC-connected to the synchronous area, the relevant TSO may specify that either:

- the DC-connected power park module shall have the capabilities prescribed in Article 25(4) of Regulation (EU) 2016/631 for that synchronous area installed at the time of initial connection and commissioning of the DC-connected power park module to the AC-network; or

— the DC-connected power park module owner shall demonstrate to, and then reach agreement with, the relevant system operator and the relevant TSO on how the reactive power capability prescribed in Article 25(4) of Regulation (EU) 2016/631 for that synchronous area will be provided in the event that the DC-connected power park module becomes AC-connected to the synchronous area.

(ii) With regard to reactive power capability, the relevant system operator may specify supplementary reactive power to be provided if the connection point of a DC-connected power park module is neither located at the high-voltage terminals of the step-up transformer to the voltage level of the connection point nor at the alternator terminals, if no step-up transformer exists. This supplementary reactive power shall compensate the reactive power exchange of the high-voltage line or cable between the high-voltage terminals of the step-up transformer of the DC-connected power park module or its alternator terminals, if no step-up transformer exists, and the connection point and shall be provided by the responsible owner of that line or cable.

3. With regard to priority to active or reactive power contribution for DC-connected power park modules, the relevant system operator, in coordination with the relevant TSO shall specify whether active power contribution or reactive power contribution has priority during faults for which fault-ride-through capability is required. If priority is given to active power contribution, its provision shall be established within a time from the fault inception as specified by the relevant system operator, in coordination with the relevant TSO.

### **Article 41**

#### **Control requirements**

1. During the synchronisation of a DC-connected power park module to the AC collection network, the DC-connected power park module shall have the capability to limit any voltage changes to a steady-state level specified by the relevant system operator, in coordination with the relevant TSO. The level specified shall not exceed 5 per cent of the pre-synchronisation voltage. The relevant system operator, in coordination with the relevant TSO, shall specify the maximum magnitude, duration and measurement window of the voltage transients.

2. The DC-connected power park module owner shall provide output signals as specified by the relevant system operator, in coordination with the relevant TSO.

### **Article 42**

#### **Network characteristics**

With regard to the network characteristics, the following shall apply for the DC-connected power park modules:

(a) each relevant system operator shall specify and make publicly available the method and the pre-fault and post-fault conditions for the calculation of minimum and maximum short circuit power at the HVDC interface point;

(b) the DC-connected power park module shall be capable of stable operation within the minimum to maximum range of short circuit power and network characteristics of the HVDC interface point specified by the relevant system operator, in coordination with the relevant TSO;

(c) each relevant system operator and HVDC system owner shall provide the DC-connected power park module owner with network equivalents representing the system, enabling the DC-connected power park module owners to design their system with regard to harmonics;

### **Article 43**

#### **Protection requirements**

1. Electrical protection schemes and settings of DC-connected power park modules shall be determined in accordance with Article 14(5)(b) of Regulation (EU) 2016/631, where the network refers to the synchronous area network. The protection schemes have to be designed taking into account the system performance, grid specificities as well as technical specificities of the power park module technology and agreed with the relevant system operator, in coordination with the relevant TSO.

2. Priority ranking of protection and control of DC-connected power park modules shall be determined in accordance with Article 14(5)(c) of Regulation (EU) 2016/631, where the network refers to the synchronous area network, and agreed with the relevant system operator, in coordination with the relevant TSO.

### **Article 44**

#### **Power quality**

DC-connected power park modules owners shall ensure that their connection to the network does not result in a level of distortion or fluctuation of the supply voltage on the network, at the connection point, exceeding the level specified by the relevant system operator, in coordination with the relevant TSO. The necessary contribution from grid users to associated studies, including, but not limited to, existing DC-connected power park modules and existing HVDC systems, shall not be unreasonably withheld. The process for necessary studies to be conducted and relevant data to be provided by all grid users involved, as well as mitigating actions identified and implemented, shall be in accordance with the process in Article 29.

### **Article 45**

#### **General system management requirements applicable to DC-connected power park modules**

With regard to general system management requirements, Articles 14(5), 15(6) and 16(4) of Regulation (EU) 2016/631 shall apply to any DC-connected power park module.

## CHAPTER 2

### Requirements for remote-end HVDC converter stations

#### **Article 46**

##### **Scope**

The requirements of Articles 11 to 39 apply to remote-end HVDC converter stations, subject to specific requirements provided for in Articles 47 to 50.

#### **Article 47**

##### **Frequency stability requirements**

1. Where a nominal frequency other than 50 Hz, or a frequency variable by design is used in the network connecting the DC-connected power park modules, subject to relevant TSO agreement, Article 11 shall apply to the remote-end HVDC converter station with the applicable frequency ranges and time periods specified by the relevant TSO, taking into account specificities of the system and the requirements laid down in Annex I.

2. With regards to frequency response, the remote-end HVDC converter station owner and the DC-connected power park module owner shall agree on the technical modalities of the fast signal communication in accordance with Article 39(1). Where the relevant TSO requires, the HVDC system shall be capable of providing the network frequency at the connection point as a signal. For an HVDC system connecting a power park module the adjustment of active power frequency response shall be limited by the capability of the DC-connected power park modules.

#### **Article 48**

##### **Reactive power and voltage requirements**

1. With respect to voltage ranges:

(a) a remote-end HVDC converter station shall be capable of staying connected to the remote-end HVDC converter station network and operating within the voltage ranges (per unit) and time periods specified in Tables 12 and 13, Annex VIII. The applicable voltage range and time periods specified are selected based on the reference 1 pu voltage;

(b) wider voltage ranges or longer minimum times for operation may be agreed between the relevant system operator, in coordination with the relevant TSO, and the DC-connected power park module owner in accordance with Article 40;

(c) for HVDC interface points at AC voltages that are not included in the scope of Table 12 and Table 13, Annex VIII, the relevant system operator, in coordination with the relevant TSO shall specify applicable requirements at the connection points;

(d) where frequencies other than nominal 50 Hz are used, subject to agreement by the relevant TSO,

the voltage ranges and time periods specified by the relevant system operator, in coordination with the relevant TSO, shall be proportional to those in Annex VIII.

2. A remote-end HVDC converter station shall fulfil the following requirements referring to voltage stability, at the connection points with regard to reactive power capability:

(a) the relevant system operator, in coordination with the relevant TSO shall specify the reactive power provision capability requirements for various voltage levels. In doing so, the relevant system operator, in coordination with the relevant TSO shall specify a  $U-Q/P_{\max}$ -profile of any shape and within the boundaries of which the remote-end HVDC converter station shall be capable of providing reactive power at its maximum HVDC active power transmission capacity;

(b) the  $U-Q/P_{\max}$ -profile shall be specified by each relevant system operator, in coordination with the relevant TSO. The  $U-Q/P_{\max}$ -profile shall be within the range of  $Q/P_{\max}$  and steady-state voltage specified in Table 14, Annex VIII, and the position of the  $U-Q/P_{\max}$ -profile envelope shall lie within the limits of the fixed outer envelope specified in Annex IV. The relevant system operator, in coordination with the relevant TSO, shall consider the long term development of the network when determining these ranges.

#### **Article 49**

##### **Network characteristics**

With regard to the network characteristics, the remote-end HVDC converter station owner shall provide relevant data to any DC-connected power park module owner in accordance with Article 42.

#### **Article 50**

##### **Power quality**

Remote-end HVDC converter station owners shall ensure that their connection to the network does not result in a level of distortion or fluctuation of the supply voltage on the network, at the connection point, exceeding the level allocated to them by the relevant system operator, in coordination with the relevant TSO. The necessary contribution from grid users to the associated studies shall not be unreasonably withheld, including from, but not limited to, existing DC-connected power park modules and existing HVDC systems. The process for necessary studies to be conducted and relevant data to be provided by all grid users involved, as well as mitigating actions identified and implemented shall be in accordance with the process provided for in Article 29.

## TITLE IV

### INFORMATION EXCHANGE AND COORDINATION

#### *Article 51*

#### **Operation of HVDC systems**

1. With regard to instrumentation for the operation, each HVDC converter unit of an HVDC system shall be equipped with an automatic controller capable of receiving instructions from the relevant system operator and from the relevant TSO. This automatic controller shall be capable of operating the HVDC converter units of the HVDC system in a coordinated way. The relevant system operator shall specify the automatic controller hierarchy per HVDC converter unit.

2. The automatic controller of the HVDC system referred to in paragraph 1 shall be capable of sending the following signal types to the relevant system operator:

(a) operational signals, providing at least the following:

- (i) start-up signals;
- (ii) AC and DC voltage measurements;
- (iii) AC and DC current measurements;
- (iv) active and reactive power measurements on the AC side;
- (v) DC power measurements;
- (vi) HVDC converter unit level operation in a multi-pole type HVDC converter;
- (vii) elements and topology status; and
- (viii) FSM, LFSM-O and LFSM-U active power ranges.

(b) alarm signals, providing at least the following:

- (i) emergency blocking;
- (ii) ramp blocking;
- (iii) fast active power reversal.

3. The automatic controller referred to in paragraph 1 shall be capable of receiving the following signal types from the relevant system operator:

(a) operational signals, receiving at least the following:

- (i) start-up command;
- (ii) active power setpoints;
- (iii) frequency sensitive mode settings;
- (iv) reactive power, voltage or similar setpoints;
- (v) reactive power control modes;
- (vi) power oscillation damping control; and
- (vii) synthetic inertia.

(b) alarm signals, receiving at least the following:

- (i) emergency blocking command;
- (ii) ramp blocking command;
- (iii) active power flow direction; and
- (iv) fast active power reversal command.

4. With regards to each signal, the relevant system operator may specify the quality of the supplied signal.

### **Article 52**

#### **Parameters and settings**

The parameters and settings of the main control functions of an HVDC system shall be agreed between the HVDC system owner and the relevant system operator, in coordination with the relevant TSO. The parameters and settings shall be implemented within such a control hierarchy that makes their modification possible if necessary. Those main control functions are at least:

- (a) synthetic inertia, if applicable as referred to in Articles 14 and 41;
- (b) frequency sensitive modes (FSM, LFSM-O, LFSM-U) referred to in Articles 15, 16 and 17;
- (c) frequency control, if applicable, referred to in Article 16;
- (d) reactive power control mode, if applicable as referred to in Article 22;
- (e) power oscillation damping capability, referred to Article 30;
- (f) subsynchronous torsional interaction damping capability, referred to Article 31.

### **Article 53**

#### **Fault recording and monitoring**

1. An HVDC system shall be equipped with a facility to provide fault recording and dynamic system behaviour monitoring of the following parameters for each of its HVDC converter stations:

- (a) AC and DC voltage;
- (b) AC and DC current;
- (c) active power;
- (d) reactive power; and
- (e) frequency.

2. The relevant system operator may specify quality of supply parameters to be complied with by the HVDC system, provided a reasonable prior notice is given.

3. The particulars of the fault recording equipment referred to in paragraph 1, including analogue and digital channels, the settings, including triggering criteria and the sampling rates, shall be agreed between the HVDC system owner, the relevant system operator and the relevant TSO.

4. All dynamic system behaviour monitoring equipment shall include an oscillation trigger, specified by the relevant system operator, in coordination with the relevant TSO, with the purpose of detecting poorly damped power oscillations.

5. The facilities for quality of supply and dynamic system behaviour monitoring shall include arrangements for the HVDC system owner and the relevant system operator to access the information electronically. The communications protocols for recorded data shall be agreed between the HVDC system owner, the relevant system operator and the relevant TSO.

### **Article 54**

#### **Simulation models**

1. The relevant system operator in coordination with the relevant TSO may specify that an HVDC system owner deliver simulation models which properly reflect the behaviour of the HVDC system in both steady-state, dynamic simulations (fundamental frequency component) and in electromagnetic transient simulations.

The format in which models shall be provided and the provision of documentation of models structure and block diagrams shall be specified by the relevant system operator in coordination with the relevant TSO.

2. For the purpose of dynamic simulations, the models provided shall contain at least, but not limited to the following sub-models, depending on the existence of the mentioned components:

- (a) HVDC converter unit models;
- (b) AC component models;
- (c) DC grid models;
- (d) Voltage and power controller;
- (e) Special control features if applicable e.g. power oscillation damping (POD) function, subsynchronous torsional interaction (SSTI) control;
- (f) Multi terminal control, if applicable;
- (g) HVDC system protection models as agreed between the relevant TSO and the HVDC system owner.

3. The HVDC system owner shall verify the models against the results of compliance tests carried out according to Title VI and a report of this verification shall be submitted to the relevant TSO. The models shall then be used for the purpose of verifying compliance with the requirements of this Regulation including, but not limited to, compliance simulations as provided for in Title VI and used in studies for continuous evaluation in system planning and operation.

4. An HVDC system owner shall submit HVDC system recordings to the relevant system operator or relevant TSO if requested in order to compare the response of the models with these recordings.

5. An HVDC system owner shall deliver an equivalent model of the control system when adverse control interactions may result with HVDC converter stations and other connections in close electrical proximity if requested by the relevant system operator or relevant TSO. The equivalent model shall contain all necessary data for the realistic simulation of the adverse control interactions.

## TITLE V

### OPERATIONAL NOTIFICATION PROCEDURE FOR CONNECTION

#### CHAPTER 1

#### Connection of new HVDC systems

##### *Article 55*

##### **General provisions**

1. The HVDC system owner shall demonstrate to the relevant system operator that it has complied with the requirements set out in Title II to Title IV at the respective connection point by successfully completing the operational notification procedure for connection of the HVDC system as described in Articles 56 to 59.
2. The relevant system operator shall specify any detailed provisions of the operational notification procedure and make the details publicly available.
3. The operational notification procedure for connection for each new HVDC system shall comprise:
  - (a) energisation operational notification (EON);
  - (b) interim operational notification (ION); and
  - (c) final operational notification (FON).

##### *Article 56*

##### **EON for HVDC systems**

1. An EON shall entitle the HVDC system owner to energise its internal network and auxiliaries and connect it to the network at its specified connection points.
2. An EON shall be issued by the relevant system operator, subject to completion of preparation and the fulfilment of the requirements specified by the relevant system operator in the relevant operational procedures. This preparation will include agreement on the protection and control settings relevant to the connection points between the relevant system operator and the HVDC system owner.

##### *Article 57*

##### **ION for HVDC systems**

1. An ION shall entitle a HVDC system owner or HVDC converter unit owner to operate the HVDC system or HVDC converter unit by using the network connections specified for the connection points for a limited period of time.
2. An ION shall be issued by the relevant system operator subject to the completion of the data and

study review process.

3. For the purpose of the completion of data and study review, the HVDC system owner or HVDC converter unit owner shall provide the following upon request from the relevant system operator:

- (a) itemised statement of compliance;
- (b) detailed technical data of the HVDC system with relevance to the network connection, that is specified with respect to the connection points, as specified by the relevant system operator, in coordination with the relevant TSOs;
- (c) equipment certificates of HVDC systems or HVDC converter units where these are relied upon as part of the evidence of compliance;
- (d) simulation models or a replica of the exact control system as specified by Article 54 and by the relevant system operator in coordination with the relevant TSOs;
- (e) studies demonstrating expected steady-state and dynamic performance as required by Titles II, III and IV;
- (f) details of intended compliance tests according to Article 72;
- (g) details of intended practical method of completing compliance tests pursuant to Title VI.

4. Except where paragraph 5 applies, the maximum period for the HVDC system owner or HVDC converter unit owner to remain in the ION status shall not exceed twenty four months. The relevant system operator may specify a shorter ION validity period. The ION validity period shall be notified to the regulatory authority in accordance with the applicable national regulatory framework. ION extension shall be granted only if the HVDC system owner demonstrates substantial progress towards full compliance. At the time of ION extension, the outstanding issues shall be explicitly identified.

5. The maximum period for an HVDC system owner or HVDC converter unit owner to remain in the ION status may be extended beyond 24 months upon request for a derogation made to the relevant system operator in accordance with the procedure in Title VII. The request shall be made before the expiry of the twenty four month period.

### **Article 58**

#### **FON for HVDC systems**

1. A FON shall entitle an HVDC system owner to operate the HVDC system or HVDC converter units by using the grid connection points.

2. A FON shall be issued by the relevant system operator upon prior removal of all incompatibilities identified for the purpose of the ION status and subject to the completion of the data and study review process.

3. For the purpose of the completion of data and study review, the HVDC system owner shall provide the following upon request from the relevant system operator in coordination with the relevant TSO:

- (a) itemised statement of compliance; and
- (b) update of applicable technical data, simulation models, a replica of the exact control system and studies as referred to in Article 57, including use of actual measured values during testing.

4. In case of incompatibility identified for the purpose of the granting of the FON, a derogation may be granted upon a request to the relevant system operator, in accordance with Articles 79 and 80. A FON shall be issued by the relevant system operator, if the HVDC system is compliant with the provisions of the derogation.

Where a request for a derogation is rejected, the relevant system operator shall have the right to refuse the operation of the HVDC system or HVDC converter units, whose owner's request for a derogation was rejected, until the HVDC system owner and the relevant system operator have resolved the incompatibility and the relevant system operator considers that the HVDC system complies with the provisions of this Regulation.

If the relevant system operator and the HVDC system owner do not resolve the incompatibility within a reasonable timeframe, but in any case not later than six months after the notification of the rejection of the request for a derogation, each party may refer the issue for decision to the regulatory authority.

### **Article 59**

#### **Limited operational notification for HVDC systems/derogations**

1. HVDC system owners to whom a FON has been granted shall inform the relevant system operator immediately in the following circumstances:

- (a) the HVDC system is temporarily subject to either a significant modification or loss of capability, due to implementation of one or more modifications of significance to its performance; or
- (b) in case of equipment failures leading to non-compliance with some relevant requirements.

2. The HVDC system owner shall apply to the relevant system operator for a limited operational notification (LON) if the HVDC system owner reasonably expects the circumstances detailed in paragraph 1 to persist for more than three months.

3. A LON shall be issued by the relevant system operator with a clear identification of:

- (a) the unresolved issues justifying the granting of the LON;
- (b) the responsibilities and timescales for expected solution; and
- (c) a maximum period of validity which shall not exceed 12 months. The initial period granted may be shorter with the possibility for extension if evidence to the satisfaction of the relevant system operator demonstrates that substantial progress has been made towards achieving full compliance.

4. The FON shall be suspended during the period of validity of the LON with regard to the subjects for which the LON has been issued.

5. A further prolongation of the period of validity of the LON may be granted upon request for a derogation made to the relevant system operator before the expiry of that period, in accordance with Articles 79 and 80.

6. The relevant system operator may refuse the operation of the HVDC system if the LON terminates and the circumstance which caused it to be issued remains. In such a case the FON shall automatically be invalid.

7. If the relevant system operator does not grant an extension of the period of validity of the LON

in accordance with paragraph 5 or if it refuses to allow the operation of the HVDC system once the LON is no longer valid in accordance with paragraph 6, the HVDC system owner may refer the issue for decision to the regulatory authority within six months after the notification of the decision of the relevant system operator.

## **CHAPTER 2**

### **Connection of new DC-connected power park modules**

#### ***Article 60***

##### **General provisions**

1. The provisions of this Chapter shall apply to new DC-connected power park modules only.
2. The DC-connected power park module owner shall demonstrate to the relevant system operator its compliance with the requirements referred to in Title III at the respective connection points by successfully completing the operational notification procedure for connection of the DC-connected power park module in accordance with Articles 61 through to 66.
3. The relevant system operator shall specify further details of the operational notification procedure and make those details publically available.
4. The operational notification procedure for connection for each new DC-connected power park module shall comprise:
  - (a) energisation operational notification (EON);
  - (b) interim operational notification (ION); and
  - (c) final operational notification (FON).

#### ***Article 61***

##### **EON for DC-connected power park modules**

1. An EON shall entitle the owner of a DC-connected power park module to energise its internal network and auxiliaries by using the grid connection that is specified by the connection points.
2. An EON shall be issued by the relevant system operator, subject to completion of preparation including agreement on the protection and control settings relevant to the connection points between the relevant system operator and the DC-connected power park module.

#### ***Article 62***

##### **ION for DC-connected power park modules**

1. An ION shall entitle the DC-connected power park module owner to operate the DC-connected power park module and generate power by using the grid connection for a limited period of time.

2. An ION shall be issued by the relevant system operator, subject to the completion of the data and study review process.
3. With respect to data and study review, the DC-connected power park module owner shall provide the following upon request from the relevant system operator:
  - (a) itemised statement of compliance;
  - (b) detailed technical data of the DC-connected power park module with relevance to the grid connection, that is specified by the connection points, as specified by the relevant system operator in coordination with the relevant TSO;
  - (c) equipment certificates of DC-connected power park module, where these are relied upon as part of the evidence of compliance;
  - (d) simulation models as specified in Article 54 and as required by the relevant system operator in coordination with the relevant TSO;
  - (e) studies demonstrating expected steady-state and dynamic performance as required by Title III; and
  - (f) details of intended compliance tests in accordance with Article 73.
4. Except where paragraph 5 applies, the maximum period for the DC-connected power park module owner to remain in the ION status shall not exceed twenty-four months. The relevant system operator may specify shorter ION validity. The ION validity period shall be notified to the regulatory authority in accordance with the applicable national regulatory framework. ION extensions shall be granted only if the DC-connected power park module owner demonstrates substantial progress towards full compliance. At the time of ION extension, any outstanding issues shall be explicitly identified.
5. The maximum period for a DC-connected power park module owner to remain in the ION status may be extended beyond 24 months upon request for a derogation made to the relevant system operator in accordance with the procedure in Title VII.

### **Article 63**

#### **FON for DC-connected power park modules**

1. A FON shall entitle the DC-connected power park module owner to operate the DC-connected power park module by using the grid connection that is specified by the connection point.
2. A FON shall be issued by the relevant system operator, upon prior removal of all incompatibilities identified for the purpose of the ION status and subject to the completion of the data and study review process as required by this Regulation.
3. For the purpose of the completion of data and study review, the DC-connected power park module owner shall provide the following upon request from the relevant system operator:
  - (a) itemised statement of compliance; and
  - (b) update of applicable technical data, simulation models and studies as referred to in Article 62(3), including use of actual measured values during testing.
4. In case of incompatibility identified for the purpose of the granting of the FON, a derogation may be granted upon request made to the relevant system operator, in accordance with the derogation

procedure according to Title VII. A FON shall be issued by the relevant system operator, if the DC-connected power park module is compliant with the provisions of the derogation. The relevant system operator shall have the right to refuse the operation of the DC-connected power park module, whose owner's request for a derogation was rejected, until the DC-connected power park module owner and the relevant system operator have resolved the incompatibility and the DC-connected power park module is considered to be compliant by the relevant system operator.

### **Article 64**

#### **Limited operational notification for DC-connected power park modules**

1. DC-connected power park module owners to whom a FON has been granted shall inform the relevant system operator immediately in the following circumstances:

(a) the DC-connected power park module is temporarily subject to either a significant modification or loss of capability, due to implementation of one or more modifications of significance to its performance; or

(b) in case of equipment failures leading to non-compliance with some relevant requirements.

2. The DC-connected power park module owner shall apply to the relevant system operator for a limited operational notification (LON), if the DC-connected power park module owner reasonably expects the circumstances detailed in paragraph 1 to persist for more than three months.

3. A LON shall be issued by the relevant TSO with a clear identification of:

(a) the unresolved issues justifying the granting of the LON;

(b) the responsibilities and timescales for expected solution; and

(c) a maximum period of validity which shall not exceed 12 months. The initial period granted may be shorter with the possibility for extension if evidence to the satisfaction of the relevant system operator demonstrating that substantial progress has been made towards achieving full compliance.

4. The FON shall be suspended during the period of validity of the LON with regard to the subjects for which the LON has been issued.

5. A further prolongation of the period of validity of the LON may be granted upon request for a derogation made to the relevant system operator, before the expiry of that period, in accordance with the derogation procedure described in Title VII.

6. The relevant system operator may refuse the operation of the DC-connected power park module if the LON terminates and the circumstance which caused it to be issued remains. In such a case the FON shall automatically be invalid.

## CHAPTER 3

### Cost benefit analysis

#### *Article 65*

#### **Identification of costs and benefits of application of requirements to existing HVDC systems or DC-connected power park modules**

1. Prior to the application of any requirement set out in this Regulation to existing HVDC systems or DC-connected power park modules in accordance with paragraph 3 of Article 4, the relevant TSO shall undertake a qualitative comparison of costs and benefits related to the requirement under consideration. This comparison shall take into account available network-based or market-based alternatives. The relevant TSO may only proceed to undertake a quantitative cost-benefit analysis in accordance with paragraphs 2 to 5, if the qualitative comparison indicates that the likely benefits exceed the likely costs. If, however, the cost is deemed high or the benefit is deemed low, then the relevant TSO shall not proceed further.
2. Following a preparatory stage undertaken in accordance with paragraph 1, the relevant TSO shall carry out a quantitative cost-benefit analysis of any requirement under consideration for application to existing HVDC systems or DC-connected power park modules that have demonstrated potential benefits as a result of the preparatory stage according to paragraph 1.
3. Within three months of concluding the cost-benefit analysis, the relevant TSO shall summarise the findings in a report which shall:
  - (a) include the cost-benefit analysis and a recommendation on how to proceed;
  - (b) include a proposal for a transitional period for applying the requirement to existing HVDC systems or DC-connected power park modules. That transitional period shall not be more than two years from the date of the decision of the regulatory authority or where applicable the **Contracting Party** on the requirement's applicability;
  - (c) be subject to public consultation in accordance with Article 8.
4. No later than six months after the end of the public consultation, the relevant TSO shall prepare a report explaining the outcome of the consultation and making a proposal on the applicability of the requirement under consideration to existing HVDC systems or DC-connected power park modules. The report and proposal shall be notified to the regulatory authority or, where applicable, the **Contracting Party**, and the HVDC system owner, DC-connected power park module owner or, where applicable, third party shall be informed on its content.
5. The proposal made by the relevant TSO to the regulatory authority or, where applicable, the **Contracting Party** pursuant to paragraph 4 shall include the following:
  - (a) an operational notification procedure for demonstrating the implementation of the requirements by the owner of the existing HVDC system or DC-connected power park module;
  - (b) a transitional period for implementing the requirements which shall take into account the category of HVDC system or DC-connected power park module and any underlying obstacles to the efficient implementation of the equipment modification/refitting.

## Article 66

### Principles of cost-benefit analysis

1. HVDC system owners, DC-connected power park module owners and DSOs, including CDSOs, shall assist and contribute to the cost-benefit analysis undertaken according to Article 65 and 80 and provide the necessary data as requested by the relevant system operator or relevant TSO within three months of receiving a request, unless agreed otherwise by the relevant TSO. For the preparation of a cost-benefit-analysis by a HVDC system owner or DC-connected power park module owner, or their prospective owner, assessing a potential derogation pursuant to Article 79, the relevant TSO and DSO, including CDSO, shall assist and contribute to the cost-benefit analysis and provide the necessary data as requested by the HVDC system owner or DC-connected power park module owner, or their prospective owner, within three months of receiving a request, unless agreed otherwise by the HVDC system owner or DC-connected power park module owner, or their prospective owner.

2. A cost-benefit analysis shall be in line with the following principles:

(a) the relevant TSO, or HVDC system owner or DC-connected power park module owner, or their prospective owner, shall base its cost-benefit analysis on one or more of the following calculating principles:

- (i) the net present value;
- (ii) the return on investment;
- (iii) the rate of return;
- (iv) the time needed to break even.

(b) the relevant TSO, or HVDC system owner or DC-connected power park module owner, or their prospective owner, shall also quantify socioeconomic benefits in terms of improvement in security of supply and shall include at least:

- (i) the associated reduction in probability of loss of supply over the lifetime of the modification;
- (ii) the probable extent and duration of such loss of supply;
- (iii) the societal cost per hour of such loss of supply.

(c) the relevant TSO, or HVDC system owner or DC-connected power park module owner, or their prospective owner, shall quantify the benefits to the internal market in electricity, cross-border trade and integration of renewable energies, including at least:

- (i) the active power frequency response;
- (ii) the balancing reserves;
- (iii) the reactive power provision;
- (iv) congestion management;
- (v) defence measures.

(d) the relevant TSO shall quantify the costs of applying the necessary rules to existing HVDC systems or DC-connected power park modules, including at least:

- (i) the direct costs incurred in implementing a requirement;

- (ii) the costs associated with attributable loss of opportunity;
- (iii) the costs associated with resulting changes in maintenance and operation.

## **TITLE VI COMPLIANCE**

### **CHAPTER 1 Compliance monitoring**

#### *Article 67*

#### **Common provisions for compliance testing**

1. Testing of the performance of HVDC systems and DC-connected power park modules shall aim at demonstrating that the requirements of this Regulation have been complied with.
2. Notwithstanding the minimum requirements for compliance testing set out in this Regulation, the relevant system operator is entitled to:
  - (a) allow the HVDC system owner or DC-connected power park module owner to carry out an alternative set of tests, provided that those tests are efficient and suffice to demonstrate that a HVDC system or DC-connected power park module complies with the requirements of this Regulation; and
  - (b) require the HVDC system owner or DC-connected power park module owner to carry out additional or alternative sets of tests in those cases where the information supplied to the relevant system operator in relation to compliance testing under the provisions of Chapter 2 of Title VI, is not sufficient to demonstrate compliance with the requirements of this Regulation.
3. The HVDC system owner or DC-connected power park module owner is responsible for carrying out the tests in accordance with the conditions laid down in Chapter 2 of Title VI. The relevant system operator shall cooperate and not unduly delay the performance of the tests.
4. The relevant system operator may participate in the compliance testing either on site or remotely from the system operator's control centre. For that purpose, the HVDC system owner or DC-connected power park module owner shall provide the monitoring equipment necessary to record all relevant test signals and measurements as well as ensure that the necessary representatives of the HVDC system owner or DC-connected power park module owner available on site for the entire testing period. Signals specified by the relevant system operator shall be provided if, for selected tests, the system operator wishes to use its own equipment to record performance. The relevant system operator has sole discretion to decide about its participation.

## **Article 68**

### **Common provisions on compliance simulation**

1. Simulation of the performance of HVDC systems and DC-connected power park modules shall aim at demonstrating that the requirements of this Regulation have been fulfilled.
2. Notwithstanding the minimum requirements set out in this Regulation for compliance simulation, the relevant system operator may:
  - (a) allow the HVDC system owner or DC-connected power park module owner to carry out an alternative set of simulations, provided that those simulations are efficient and suffice to demonstrate that a HVDC system or DC-connected power park module complies with the requirements of this Regulation or with national legislation; and
  - (b) require the HVDC system owner or DC-connected power park module owner to carry out additional or alternative sets of simulations in those cases where the information supplied to the relevant system operator in relation to compliance simulation under the provisions of Chapter 3 of Title VI, is not sufficient to demonstrate compliance with the requirements of this Regulation.
3. To demonstrate compliance with the requirements of this Regulation, the HVDC system owner and DC-connected power park module owner shall provide a report with the simulation results. The HVDC system owner and DC-connected power park module owner shall produce and provide a validated simulation model for a given HVDC system or DC-connected power park module. The scope of the simulation models is set out in Articles 38 and 54.
4. The relevant system operator shall have the right to check that a HVDC system and DC-connected power park module complies with the requirements of this Regulation by carrying out its own compliance simulations based on the provided simulation reports, simulation models and compliance test measurements.
5. The relevant system operator shall provide the HVDC system owner or DC-connected power park module owner with technical data and a simulation model of the network, to the extent necessary to carry out the requested simulations in accordance with Chapter 3 of Title VI.

## **Article 69**

### **Responsibility of the HVDC system owner and DC-connected power park module owner**

1. The HVDC system owner shall ensure that the HVDC system and HVDC converter stations are compliant with the requirements provided for by this Regulation. This compliance shall be maintained throughout the lifetime of the facility.
2. The DC-connected power park module owner shall ensure that the DC-connected power park module is compliant with the requirements under this Regulation. This compliance shall be maintained throughout the lifetime of the facility.
3. Planned modifications of the technical capabilities of the HVDC system, HVDC converter station or DC-connected power park module with possible impact on its compliance to the requirements under this Regulation shall be notified to the relevant system operator by the HVDC system owner or

DC-connected power park module owner before initiating such modification.

4. Any operational incidents or failures of an HVDC system, HVDC converter station or DC-connected power park module that have impact on its compliance to the requirements of this Regulation shall be notified to the relevant system operator by the HVDC system owner or DC-connected power park module owner as soon as possible without any delay after the occurrence of such an incident.

5. Any foreseen test schedules and procedures to verify compliance of an HVDC system, HVDC converter station or DC-connected power park module with the requirements of this Regulation shall be notified to the relevant system operator by the HVDC system owner or DC-connected power park module owner in due time and prior to their launch and shall be approved by the relevant system operator.

6. The relevant system operator shall be facilitated to participate in such tests and may record the performance of the HVDC systems, HVDC converter stations or DC-connected power park modules.

### **Article 70**

#### **Tasks of the relevant system operator**

1. The relevant system operator shall assess the compliance of an HVDC system, HVDC converter station and DC-connected power park module with the requirements under this Regulation throughout the lifetime of the HVDC system, HVDC converter station or DC-connected power park module. The HVDC system owner or DC-connected power park module owner shall be informed of the outcome of this assessment.

2. Where requested by the relevant system operator, the HVDC system owner or DC-connected power park module owner shall carry out compliance tests and simulations, not only during the operational notification procedures according to Title V, but repeatedly throughout the lifetime of the HVDC system, HVDC converter station or DC-connected power park module according to a plan or general scheme for repeated tests and specified simulations or after any failure, modification or replacement of any equipment that may have impact on the compliance with the requirements under this Regulation. The HVDC system owner or DC-connected power park module owner shall be informed of the outcome of these compliance tests and simulations.

3. The relevant system operator shall make publicly available the list of information and documents to be provided as well as the requirements to be fulfilled by the HVDC system owner or DC-connected power park module owner in the frame of the compliance process. Such list shall cover at least the following information, documents and requirements:

- (a) all documentation and certificates to be provided by the HVDC system owner or DC-connected power park module owner;
- (b) details of the technical data of the HVDC system, HVDC converter station or DC-connected power park module with relevance to the grid connection;
- (c) requirements for models for steady-state and dynamic system studies;
- (d) timeline for the provision of system data required to perform the studies;
- (e) studies by the HVDC system owner or DC-connected power park module owner to demonstrate

the expected steady-state and dynamic performance in accordance with the requirements set out in Titles II, III and IV;

(f) conditions and procedures including the scope for registering equipment certificates; and

(g) conditions and procedures for use of relevant equipment certificates, issued by an authorised certifier, by the DC-connected power park module owner.

4. The relevant system operator shall make publicly available the allocation of responsibilities to the HVDC system owner or DC-connected power park module owner and to the system operator for compliance testing, simulation and monitoring.

5. The relevant system operator may partially or totally assign the performance of its compliance monitoring to third parties. In this case, the relevant system operator shall ensure compliance with Article 10 by appropriate confidentiality commitments with the assignee.

6. The relevant system operator shall not unreasonably withhold any operational notification in accordance with Title V, if compliance tests or simulations cannot be performed as agreed between the relevant system operator and the HVDC system owner or DC-connected power park module owner due to reasons which are in the sole control of the relevant system operator.

7. The relevant system operator shall provide the relevant TSO when requested the compliance test and simulation results referred to in this Chapter.

## **CHAPTER 2**

### **Compliance testing**

#### **Article 71**

#### **Compliance testing for HVDC systems**

1. Equipment certificates may be used instead of part of the tests below, on the condition that they are provided to the relevant system operator.

2. With regard to the reactive power capability test:

(a) the HVDC converter unit or the HVDC converter station shall demonstrate its technical capability to provide leading and lagging reactive power capability according to Article 20;

(b) the reactive power capability test shall be carried out at maximum reactive power, both leading and lagging, and concerning the verification of the following parameters:

(i) Operation at minimum HVDC active power transmission capacity;

(ii) Operation at maximum HVDC active power transmission capacity;

(iii) Operation at active power setpoint between those minimum and maximum HVDC active power transmission capacity.

(c) the test shall be deemed passed, provided that the following conditions are cumulatively fulfilled:

(i) the HVDC converter unit or the HVDC converter station has been operating no shorter than 1 hour at maximum reactive power, both leading and lagging, for each parameter as referred

to in point (b);

(ii) the HVDC converter unit or the HVDC converter station demonstrates its capability to change to any reactive power setpoint within the applicable reactive power range within the specified performance targets of the relevant reactive power control scheme; and

(iii) no action of any protection within the operation limits specified by reactive power capacity diagram occurs.

3. With regard to the voltage control mode test:

(a) the HVDC converter unit or the HVDC converter station shall demonstrate its capability to operate in voltage control mode in the conditions set forth in Article 22(3);

(b) the voltage control mode test shall apply concerning the verification of the following parameters:

(i) the implemented slope and deadband of the static characteristic;

(ii) the accuracy of the regulation;

(iii) the insensitivity of the regulation;

(iv) the time of reactive power activation.

(c) the test shall be deemed passed, provided that the following conditions are cumulatively fulfilled:

(i) the range of regulation and adjustable droop and deadband is compliant with agreed or decided characteristic parameters, according to Article 22(3);

(ii) the insensitivity of voltage control is not higher than 0,01 pu;

(iii) following a step change in voltage, 90% of the change in reactive power output has been achieved within the times and tolerances according to Article 22(3).

4. With regard to the reactive power control mode test:

(a) the HVDC converter unit or the HVDC converter station shall demonstrate its capability to operate in reactive power control mode, according to the conditions referred to in Article 22(4);

(b) the reactive power control mode test shall be complementary to the reactive power capability test;

(c) the reactive power control mode test shall apply concerning the verification of the following parameters:

(i) the reactive power setpoint range and step;

(ii) the accuracy of the regulation; and

(iii) the time of reactive power activation.

(d) the test shall be deemed passed, provided that the following conditions are cumulatively fulfilled:

(i) the reactive power setpoint range and step is ensured according to Article 22(4);

(ii) the accuracy of the regulation is compliant with the conditions as referred to in Article 22(3).

5. With regard to the power factor control mode test:

(a) the HVDC converter unit or the HVDC converter station shall demonstrate its capability to operate in power factor control mode according to the conditions referred to in Article 22(5);

(b) the power factor control mode test shall apply concerning the verification of the following parameters:

- (i) the power factor setpoint range;
  - (ii) the accuracy of the regulation;
  - (iii) the response of reactive power due to step change of active power.
- (c) the test shall be deemed passed, provided that the following conditions are cumulatively fulfilled:
- (i) the power factor setpoint range and step is ensured according to Article 22(5);
  - (ii) the time of reactive power activation as result of step active power change does not exceed the requirements specified in accordance with Article 22(5);
  - (iii) the accuracy of the regulation is compliant with the value, as referred to in Article 22(5).

6. With regard to the FSM response test:

(a) the HVDC system shall demonstrate its technical capability to continuously modulate active power over the full operating range between maximum HVDC active power transmission capacity and minimum HVDC active power transmission capacity to contribute to frequency control and shall verify the steady-state parameters of regulations, such as droop and deadband and dynamic parameters, including robustness during frequency step change response and large, fast frequency changes;

(b) the test shall be carried out by simulating frequency steps and ramps big enough to activate at least 10% of the full active power frequency response range in each direction, taking into account the droop settings and the deadband. Simulated frequency deviation signals shall be injected into the controller of the HVDC converter unit or the HVDC converter station;

(c) the test shall be deemed to be passed, provided that the following conditions are all fulfilled:

- (i) activation time of full active power frequency response range as result of a step frequency change has been no longer than required by Annex II;
- (ii) undamped oscillations do not occur after the step change response;
- (iii) the initial delay time has been according to Annex II;
- (iv) the droop settings are available within the range provided for in Annex II and deadband (thresholds) is not more than the value in Annex II;
- (v) insensitivity of active power frequency response at any relevant operating point does not exceed the requirements set forth in Annex II.

7. With regard to the LFSM-O response test:

(a) the HVDC system shall demonstrate its technical capability to continuously modulate active power to contribute to frequency control in case of large increase of frequency in the system and shall verify the steady-state parameters of regulations, such as droop and deadband, and dynamic parameters, including frequency step change response;

(b) the test shall be carried out by simulating frequency steps and ramps big enough to activate at least 10% of the full operating range for active power, taking into account the droop settings and the deadband. Simulated frequency deviation signals shall be injected into the controller of the HVDC converter unit or the HVDC converter station;

(c) the test shall be deemed passed, provided that the following conditions are both fulfilled:

- (i) the test results, for both dynamic and static parameters, are in line with the requirements as referred to in Annex II;

(ii) undamped oscillations do not occur after the step change response.

8. With regard to the LFSM-U response test:

(a) the HVDC system shall demonstrate its technical capability to continuously modulate active power at operating points below maximum HVDC active power transmission capacity to contribute to frequency control in case of large drop of frequency in the system;

(b) the test shall be carried out by simulating at appropriate active power load points with low frequency steps and ramps big enough to activate at least 10% of the full operating range for active power, taking into account the droop settings and the deadband. Simulated frequency deviation signals shall be injected into the controller of the HVDC converter unit or the HVDC converter station;

(c) the test shall be deemed passed, provided that the following conditions are both fulfilled:

(i) the test results, for both dynamic and static parameters, are in line with the requirements as referred to in Annex II;

(ii) undamped oscillations do not occur after the step change response.

9. With regard to the active power controllability test:

(a) the HVDC system shall demonstrate its technical capability to continuously modulate active power over the full operating range according to Article 13(1)(a) and (d);

(b) the test shall be carried out by sending manual and automatic instructions by the relevant TSO;

(c) the test shall be deemed passed, provided that the following conditions are cumulatively fulfilled:

(i) the HVDC system has demonstrated stable operation;

(ii) the time of adjustment of the active power is shorter than the delay specified pursuant to Article 13(1)(a);

(iii) the dynamic response of the HVDC system when receiving instructions for the purposes of exchange or sharing of reserves, or for participating in imbalance netting processes, if capable of fulfilling the requirements for these products, as specified by the relevant TSO, has been demonstrated.

10. With regard to the ramping rate modification test:

(a) the HVDC system shall demonstrate its technical capability to adjust the ramping rate according to Article 13(2);

(b) the test shall be carried out by relevant TSO sending instructions of ramping modifications;

(c) the test shall be deemed passed, provided that the following conditions are cumulatively fulfilled:

(i) ramping rate is adjustable;

(ii) the HVDC system has demonstrated stable operation during ramping periods.

11. With regard to the black start test, if applicable:

(a) the HVDC system shall demonstrate its technical capability to energise the busbar of the remote AC substation to which it is connected, within a time frame specified by the relevant TSO, according to Article 37(2);

(b) the test shall be carried out while the HVDC system starts from shut down;

(c) the test shall be deemed passed, provided that the following conditions are cumulatively fulfilled:

- (i) the HVDC system has demonstrated being able to energise the busbar of the remote AC-substation to which it is connected;
- (ii) the HVDC system operates from a stable operating point at agreed capacity, according to the procedure of Article 37(3).

### **Article 72**

#### **Compliance testing for DC-connected power park modules and remote-end HVDC converter units**

1. Equipment certificates may be used instead of part of the tests below, on the condition that they are provided to the relevant system operator.
2. With regard to the reactive power capability test of DC-connected power park modules:
  - (a) the DC-connected power park module shall demonstrate its technical capability to provide leading and lagging reactive power capability according to Article 40(2);
  - (b) the reactive power capability test shall be carried out at maximum reactive power, both leading and lagging, and concerning the verification of the following parameters:
    - (i) operation in excess of 60% of maximum capacity for 30 minutes;
    - (ii) operation within the range of 30-50% of maximum capacity for 30 minutes; and
    - (iii) operation within the range of 10-20% of maximum capacity for 60 minutes.
  - (c) the test shall be deemed passed, provided that the following conditions are cumulatively fulfilled:
    - (i) the DC-connected power park module has been operating no shorter than requested duration at maximum reactive power, both leading and lagging, in each parameter as referred to in point (b);
    - (ii) the DC-connected power park module has demonstrated its capability to change to any reactive power setpoint within the agreed or decided reactive power range within the specified performance targets of the relevant reactive power control scheme; and
    - (iii) no action of any protection within the operation limits specified by reactive power capacity diagram occurs.
3. With regard to the reactive power capability test of remote-end HVDC converter units:
  - (a) the HVDC converter unit or the HVDC converter station shall demonstrate its technical capability to provide leading and lagging reactive power capability according to Article 48(2);
  - (b) the test shall be deemed passed, provided that the following conditions are cumulatively fulfilled:
    - (i) the HVDC converter unit or the HVDC converter station has been operating no shorter than 1 hour at maximum reactive power, both leading and lagging, at:
      - minimum HVDC active power transmission capacity;
      - maximum HVDC active power transmission capacity; and
      - an active power operating point between those maximum and minimum ranges.
    - (ii) the HVDC converter unit or the HVDC converter station demonstrates its capability to change to any reactive power setpoint within the agreed or decided reactive power range within the

specified performance targets of the relevant reactive power control scheme; and

(iii) no action of any protection within the operation limits specified by reactive power capacity diagram occurs.

4. With regard to the voltage control mode test:

(a) the DC-connected power park module shall demonstrate its capability to operate in voltage control mode in the conditions set forth in Article 21 of Regulation (EU) 2016/631;

(b) the voltage control mode test shall apply concerning the verification of the following parameters:

(i) the implemented slope and deadband of the static characteristic;

(ii) the accuracy of the regulation;

(iii) the insensitivity of the regulation;

(iv) the time of reactive power activation.

(c) the test shall be deemed passed, provided that the following conditions are cumulatively fulfilled:

(i) the range of regulation and adjustable the droop and deadband is compliant with agreed or decided characteristic parameters, according to Article 21(3)(d) of Regulation (EU) 2016/631;

(ii) the insensitivity of voltage control is not higher than 0,01 pu, according to Article 21(3)(d) of Regulation (EU) 2016/631;

(iii) following a step change in voltage, 90% of the change in reactive power output has been achieved within the times and tolerances according to Article 21(3)(d) of Regulation (EU) 2016/631.

5. With regard to the reactive power control mode test:

(a) the DC-connected power park module shall demonstrate its capability to operate in reactive power control mode, according to the conditions referred to in Article 21(3)(d)(iii) of Regulation (EU) 2016/631;

(b) the reactive power control mode test shall be complementary to the reactive power capability test;

(c) the reactive power control mode test shall apply concerning the verification of the following parameters:

(i) the reactive power setpoint range and step;

(ii) the accuracy of the regulation;

(iii) the time of reactive power activation.

(d) the test shall be deemed passed, provided that the following conditions are cumulatively fulfilled:

(i) the reactive power setpoint range and step is ensured according to Article 21(3)(d) of Regulation (EU) 2016/631;

(ii) the accuracy of the regulation is compliant with the conditions as referred to in Article 21(3)(d) of Regulation (EU) 2016/631.

6. With regard to the power factor control mode test:

(a) the DC-connected power park module shall demonstrate its capability to operate in power factor control mode according to the conditions referred to in Article 21(3)(d)(iv) of Regulation (EU) 2016/631;

(b) the power factor control mode test shall apply concerning the verification of the following parameters:

- (i) the power factor setpoint range;
  - (ii) the accuracy of the regulation;
  - (iii) the response of reactive power due to step change of active power.
- (c) the test shall be deemed passed, provided that the following conditions are cumulatively fulfilled:
- (i) the power factor setpoint range and step is ensured according to Article 21(3)(d) of Regulation (EU) 2016/631;
  - (ii) the time of reactive power activation as result of step active power change does not exceed the requirement according to Article 21(3)(d) of Regulation (EU) 2016/631;
  - (iii) the accuracy of the regulation is compliant with the value, as referred to in Article 21(3)(d) of Regulation (EU) 2016/631.
7. With regard to the tests identified in paragraphs 4, 5 and 6 the relevant TSO may select only two of the three control options for testing.
8. With regard to LFSM-O response of DC-connected power park module, the tests shall be carried out in accordance with Article 47(3) of Regulation (EU) 2016/631.
9. With regard to LFSM-U response of DC-connected power park module, the tests shall be carried out in accordance with Article 48(3) of Regulation (EU) 2016/631.
10. With regard to active power controllability of DC-connected power park module, the tests shall be carried out in accordance with 48(2) of Regulation (EU) 2016/631.
11. With regard to FSM response of DC-connected power park module, the tests shall be carried out in accordance with Article 48(4) of Regulation (EU) 2016/631.
12. With regard to frequency restoration control of DC-connected power park module, the tests shall be carried out in accordance with Article 45(5) of Regulation (EU) 2016/631.
13. With regard to fast signal response of DC-connected power park module, the test shall be deemed passed if the DC-connected power park module can demonstrate its response within the time specified in Article 39(1)(a).
14. With regard to tests for DC-connected power park modules where the AC collection network is not at nominal 50 Hz frequency, the relevant system operator, in coordination with the relevant TSO, shall agree with the DC-connected power park module owner the compliance tests required.

## **CHAPTER 3**

### **Compliance simulations**

#### **Article 73**

#### **Compliance simulations for HVDC systems**

1. Equipment certificates may be used instead of part of the simulations below, on the condition that they are provided to the relevant system operator.
2. With regard to the fast fault current injection simulation:

(a) the HVDC converter unit owner or the HVDC converter station owner shall simulate fast fault current injection in the conditions set forth in Article 19;

(b) the simulation is deemed passed, provided that compliance with the requirements specified in accordance with Article 19 is demonstrated.

3. With regard to the fault-ride-through capability simulation:

(a) the HVDC system owner shall simulate the capability for fault-ride-through in the conditions set forth in Article 25; and

(b) the simulation is deemed passed, provided that compliance with the requirements specified in accordance with Article 25 is demonstrated.

4. With regard to the post fault active power recovery simulation:

(a) the HVDC system owner shall simulate the capability for post fault active power recovery in the conditions set forth in Article 26;

(b) the simulation is deemed passed, provided that compliance with the requirements specified in accordance with Article 26 is demonstrated.

5. With regard to the reactive power capability simulation:

(a) the HVDC converter unit owner or the HVDC converter station owner shall simulate the capability for leading and lagging reactive power capability in the conditions referred to in Article 20(2) to (4);

(b) the simulation shall be deemed passed, provided that the following conditions are cumulatively fulfilled:

(i) the simulation model of the HVDC converter unit or the HVDC converter station is validated against the compliance tests for reactive power capability as referred to in Article 71;

(ii) compliance with the requirements as referred to in Article 20(2) to (4) is demonstrated.

6. With regard to the power oscillations damping control simulation:

(a) the HVDC system owner shall demonstrate the performance of its control system (POD function) to damp power oscillations in the conditions set forth in Article 30;

(b) the tuning shall result in improved damping of corresponding active power response of the HVDC system in combination with the POD function compared to the active power response of the HVDC system without POD;

(c) the simulation shall be deemed passed, provided that the following conditions are cumulatively fulfilled:

(i) the POD function damps the existing power oscillations of the HVDC system within a frequency range specified by the relevant TSO. This frequency range shall include the local mode frequency of the HVDC system and the expected network oscillations; and

(ii) a change of active power transfer of the HVDC system as specified by the relevant TSO does not lead to undamped oscillations in active or reactive power of the HVDC system.

7. With regard to the simulation of active power modification in case of disturbance:

(a) the HVDC system owner shall simulate the capability to quickly modify active power according to Article 13(1)(b); and

(b) the simulation shall be deemed passed, provided that the following conditions are cumulatively

fulfilled:

- (i) the HVDC system has demonstrated stable operation when following the pre-specified sequence of active power variation;
- (ii) the initial delay of the adjustment of the active power is shorter than the value specified in Article 13(1)(b) or reasonably justified if greater.

8. With regard to the fast active power reversal simulation, as applicable:

(a) the HVDC system owner shall simulate the capability to quickly reverse active power according to Article 13(1)(c);

(b) the simulation shall be deemed passed, provided that the following conditions are cumulatively fulfilled:

- (i) the HVDC system has demonstrated stable operation;
- (ii) the time of adjustment of the active power is shorter than the value specified in Article 13(1)
- (c) or reasonably justified if greater.

#### **Article 74**

#### **Compliance simulations for DC-connected power park modules and remote-end HVDC converter units**

1. DC-connected power park modules are subject to the compliance simulations detailed in this Article. Equipment certificates may be used instead of part of the simulations described below, on the condition that they are provided to the relevant system operator.

2. With regard to the fast fault current injection simulation:

(a) the DC-connected power park module owner shall simulate the capability for fast fault current injection in the conditions set forth in Article 20(2)(b) of Regulation (EU) 2016/631; and

(b) the simulation shall be deemed passed, provided that compliance with the requirement according to Article 20(2)(b) of Regulation (EU) 2016/631 is demonstrated.

3. With regard to the post fault active power recovery simulation:

(a) the DC-connected power park module owner shall simulate the capability for post fault active power recovery in the conditions set forth in Article 20(3)(a) of Regulation (EU) 2016/631; and

(b) the simulation shall be deemed passed, provided that compliance with the requirement according to Article 20(3)(a) of Regulation (EU) 2016/631 is demonstrated.

4. With regard to the reactive power capability simulation of DC-connected power park modules:

(a) the DC-connected power park module owner shall simulate the capability for leading and lagging reactive power capability in the conditions referred to in Article 40(2); and

(b) the simulation shall be deemed passed, provided that the following conditions are cumulatively fulfilled:

- (i) the simulation model of the DC-connected power park module is validated against the compliance tests for reactive power capability as referred to in Article 72(2);

(ii) compliance with the requirements as referred to in Article 40(2) is demonstrated.

5. With regard to the reactive power capability simulation of remote-end HVDC converter units:

(a) the remote-end HVDC converter unit owner or the remote-end HVDC converter station owner shall simulate the capability for leading and lagging reactive power capability in the conditions referred to in Article 48(2); and

(b) the simulation shall be deemed passed, provided that the following conditions are cumulatively fulfilled:

(i) the simulation model of the remote-end HVDC converter unit or the remote-end HVDC converter station is validated against the compliance tests for reactive power capability at the as referred to in Article 72(3);

(ii) compliance with the requirements as referred to in Article 48(2) is demonstrated.

6. With regard to the power oscillations damping control simulation:

(a) the DC-connected power park module owner shall simulate the capability for power oscillations damping under the conditions as referred to in Article 21(3)(f) of Regulation (EU) 2016/631; and

(b) the simulation shall be deemed passed, provided that the model demonstrates compliance with the conditions of Article 21(3)(f) of Regulation (EU) 2016/631.

7. With regard to fault-ride-through capability simulation:

(a) the DC-connected power park module owner shall simulate the capability for fault-ride-through under the conditions as referred to in Article 16(3)(a) of Regulation (EU) 2016/631;

(b) the simulation shall be deemed passed, provided that the model demonstrates compliance with the conditions of Article 16(3)(a) of Regulation (EU) 2016/631.

## CHAPTER 4

### Non-binding guidance and monitoring of implementation

#### *Article 75*

#### Non-binding guidance on implementation

1 <...>

2 <...>

3. The non-binding guidance **published by ENTSO for Electricity** explains the technical issues, conditions and interdependencies which need to be considered when complying with the requirements of this Regulation at national level.

#### *Article 76*

#### Monitoring

1. ENTSO for Electricity shall monitor the implementation of this Regulation **for the Contracting**

**Parties whose TSOs are members of ENTSO for Electricity. The Secretariat and the Energy Community Regulatory Board shall monitor the implementation of this Regulation for the Contracting Parties whose TSOs are not members of ENTSO for Electricity <...>. Monitoring shall take into account the list of relevant information developed by the Agency for the Cooperation of Energy Regulators and** it shall cover in particular the following matters:

- (a) identification of any divergences in the national implementation of this Regulation;
- (b) assessment of whether the choice of values and ranges in the requirements applicable to HVDC systems and DC-connected power park modules under this Regulation continues to be valid.

**ENTSO for Electricity shall report its findings to the Secretariat and the Energy Community Regulatory Board The Secretariat and the Energy Community Regulatory Board shall make available the findings stemming from the monitoring of the implementation of this Regulation.**

2. <...>

3. Relevant TSOs shall submit to **the Secretariat, the Energy Community Regulatory Board and ENTSO for Electricity** the information required to perform the tasks referred to in paragraph 1 <...>.

Based on a request of the regulatory authority, DSOs shall provide TSOs with information under paragraph 1 unless the information is already obtained by regulatory authorities, the **Secretariat, Energy Community Regulatory Board** or ENTSO-E in relation to their respective implementation monitoring tasks, with the objective of avoiding duplication of information.

4. <...>

## TITLE VII DEROGATIONS

### *Article 77*

#### **Power to grant derogations**

1. Regulatory authorities may, at the request of a HVDC system owner or DC-connected power park module owner, or their prospective owner, relevant system operator or relevant TSO, grant HVDC system owners or DC-connected power park module owners, or their prospective owner, relevant system operators or relevant TSOs derogations from one or more provisions of this Regulation for new and existing HVDC system and/or DC-connected power park modules in accordance with Articles 78 to 82.

2. Where applicable in a **Contracting Party**, derogations may be granted and revoked in accordance with Articles 78 to 81 by other authorities than the regulatory authority.

### *Article 78*

#### **General provisions**

1. Each regulatory authority shall specify, after consulting relevant system operators, HVDC system

owners and DC-connected power park module owners and other stakeholders whom it deems affected by this Regulation, the criteria for granting derogations pursuant to Articles 79 to 81. It shall publish those criteria on its website and notify them to the **Secretariat** within nine months of the **expiry of the deadline for transposition** of this Regulation. The **Secretariat** may require a regulatory authority to amend the criteria if it considers that they are not in line with this Regulation. This possibility to review and amend the criteria for granting derogations shall not affect the derogations already granted which shall continue to apply until the scheduled expiry date as detailed in the decision granting the exemption.

2. If the regulatory authority deems that it is necessary due to a change in circumstances relating to the evolution of system requirements, it may review and amend at most once every year the criteria for granting derogations in accordance with paragraph 1. Any changes to the criteria shall not apply to derogations for which a request has already been made.

3. The regulatory authority may decide that HVDC systems or DC-connected power park modules for which a request for a derogation has been filed pursuant to Articles 79 to 81 do not need to comply with the requirements of this Regulation from which a derogation has been sought from the day of filing the request until the regulatory authority's decision is issued.

### **Article 79**

#### **Request for derogations by an HVDC system owner or DC-connected power park module owner**

1. HVDC system owners and DC-connected power park module owners, or their prospective owner, may request a derogation to one or several requirements of this Regulation.

2. A request for a derogation shall be filed with the relevant system operator and include:

(a) an identification of the HVDC system owner or DC-connected power park module owner, or their prospective owner, and a contact person for any communications;

(b) a description of the HVDC system or DC-connected power park module for which a derogation is requested;

(c) a reference to the provisions of this Regulation from which a derogation is requested and a detailed description of the requested derogation;

(d) detailed reasoning, with relevant supporting documents, and cost-benefit analysis pursuant to the requirements of Article 66;

(e) demonstration that the requested derogation would have no adverse effect on cross-border trade;

(f) in the case of a DC-connected power park module connected to one or more remote-end HVDC converter stations, evidence that the converter station will not be affected by the derogation or, alternatively, agreement from the converter station owner to the proposed derogation.

3. Within two weeks of receipt of a request for a derogation, the relevant system operator shall confirm to the HVDC system owner or DC-connected power park module owner, or their prospective owner, whether the request is complete. If the relevant system operator considers that the request is incomplete, the HVDC system owner or DC-connected power park module owner, or their prospective

owner, shall submit the additional required information within one month from the receipt of the request for additional information. If the HVDC system owner or DC-connected power park module owner, or their prospective owner, does not supply the requested information within that time limit, the request for a derogation shall be deemed withdrawn.

4. The relevant system operator shall, in coordination with the relevant TSO and any affected adjacent DSO or DSOs, assess the request for a derogation and the provided cost-benefit analysis, taking into account the criteria determined by the regulatory authority pursuant to Article 78.

5. If a request for a derogation concerns a HVDC system or DC-connected power park module connected to a distribution system, including a closed distribution system, the relevant system operator's assessment must be accompanied by an assessment of the request for a derogation by the relevant TSO. The relevant TSO shall provide its assessment within two months of being requested to do so by the relevant system operator.

6. Within six months of receipt of a request for a derogation, the relevant system operator shall forward the request to the regulatory authority and submit the assessment(s) prepared in accordance with paragraphs 4 and 5. That period may be extended by one month where the relevant system operator seeks further information from the HVDC system owner or DC-connected power park module owner, or their prospective owner, and by two months where the relevant system operator requests the relevant TSO to submit an assessment of the request for a derogation.

7. The regulatory authority shall adopt a decision concerning any request for a derogation within six months from the day after it receives the request. That time limit may be extended by three months before its expiry where the regulatory authority requires further information from the HVDC system owner or DC-connected power park module owner, or their prospective owner, or from any other interested parties. The additional period shall begin when the complete information has been received.

8. The HVDC system owner or DC-connected power park module owner, or their prospective owner, shall submit any additional information requested by the regulatory authority within two months of such request. If the HVDC system owner or DC-connected power park module owner, or the prospective owner, does not supply the requested information within that time limit, the request for a derogation shall be deemed withdrawn unless, before its expiry:

- (a) the regulatory authority decides to provide an extension; or
- (b) the HVDC system owner or DC-connected power park module owner, or their prospective owner, informs the regulatory authority by means of a reasoned submission that the request for a derogation is complete.

9. The regulatory authority shall issue a reasoned decision concerning a request for a derogation. Where the regulatory authority grants a derogation, it shall specify its duration.

10. The regulatory authority shall notify its decision to the HVDC system owner or DC-connected power park module owner, or their prospective owner, the relevant system operator and the relevant TSO.

11. A regulatory authority may revoke a decision granting a derogation if the circumstances and underlying reasons no longer apply or upon a reasoned recommendation of the **Secretariat** or reasoned recommendation by the **Energy Community Regulatory Board** pursuant to Article 83(2).

**Article 80****Request for a derogation by a relevant system operator or relevant TSO**

1. Relevant system operators or relevant TSOs may request a derogation for classes of HVDC systems or DC-connected power park modules connected or to be connected to their network.
  2. Relevant system operators or relevant TSOs shall submit their requests for a derogation to the regulatory authority. Each request for a derogation shall include:
    - (a) identification of the relevant system operator or relevant TSO, and a contact person for any communications;
    - (b) a description of the HVDC systems or DC-connected power park modules for which a derogation is requested and the total installed capacity and number of HVDC systems or DC-connected power park modules;
    - (c) the requirement or requirements of this Regulation for which a derogation is requested, with a detailed description of the requested derogation;
    - (d) detailed reasoning, with all relevant supporting documents;
    - (e) demonstration that the requested derogation would have no adverse effect on cross-border trade;
    - (f) a cost-benefit analysis pursuant to the requirements of Article 66. If applicable, the cost-benefit analysis shall be carried out in coordination with the relevant TSO and any adjacent DSOs.
  3. Where the request for a derogation is submitted by a relevant DSO or CDSO, the regulatory authority shall, within two weeks from the day after receipt of that request, ask the relevant TSO to assess the request for a derogation in the light of the criteria determined by the regulatory authority pursuant to Article 78.
  4. Within two weeks from the day after the receipt of such request for assessment, the relevant TSO shall confirm to the relevant DSO or CDSO whether the request for a derogation is complete. If the relevant TSO considers that it is incomplete, the relevant DSO or CDSO shall submit the required additional information within one month from the receipt of the request for additional information.
  5. Within six months of receipt of a request for a derogation, the relevant TSO shall submit to the regulatory authority its assessment, including any relevant documentation. The six-month time limit may be extended by one month where the relevant TSO seeks further information from the relevant DSO or from the relevant CDSO.
  6. The regulatory authority shall adopt a decision concerning a request for a derogation within six months from the day after it receives the request. Where the request for a derogation is submitted by the relevant DSO or CDSO, the six-month time limit runs from the day following receipt of the relevant TSO's assessment pursuant to paragraph 5.
  7. The six-month time limit referred to in paragraph 6 may, before its expiry, be extended by an additional three months where the regulatory authority requests further information from the relevant system operator requesting the derogation or from any other interested parties. That additional period shall run from the day following the date of receipt of the complete information.
- The relevant system operator shall provide any additional information requested by the regulatory authority within two months from the date of the request. If the relevant system operator does not

provide the requested additional information within that time limit, the request for a derogation shall be deemed withdrawn unless, before expiry of the time limit:

- (a) the regulatory authority decides to provide an extension; or
- (b) the relevant system operator informs the regulatory authority by means of a reasoned submission that the request for a derogation is complete.

8. The regulatory authority shall issue a reasoned decision concerning a request for a derogation. Where the regulatory authority grants a derogation, it shall specify its duration.

9. The regulatory authority shall notify its decision to the relevant system operator requesting the derogation, the relevant TSO and the **Secretariat and Energy Community Regulatory Board**.

10. Regulatory authorities may lay down further requirements concerning the preparation of requests for derogations by relevant system operators. In doing so, regulatory authorities shall take into account the delineation between the transmission system and the distribution system at the national level and shall consult with system operators, HVDC system owners, DC-connected power park module owners and stakeholders, including manufacturers.

11. A regulatory authority may revoke a decision granting a derogation if the circumstances and underlying reasons no longer apply or upon a reasoned recommendation of the **Secretariat** or reasoned recommendation by the **Energy Community Regulatory Board** pursuant to Article 83(2).

### **Article 81**

#### **Request for derogations from the provisions of Title III by a DC-connected power park module owner**

1. A request for a derogation to the provisions of Article 40(1)(b) and (c), Article 40(2)(a) and (b), and Articles 41 to 45 shall not be subject to Article 79(2)(d) and (e) where it relates to a DC-connected power park module that has, or will have, a single connection to a single synchronous area.

2. The regulatory authority may attach any conditions to a decision concerning request for a derogation referred to in paragraph 1. This may include a condition that the development of the connection into a multi-terminal network, or that connection of a further power park module at the same point, will cause the derogation to be evaluated by the regulatory authority or to expire. The regulatory authority shall take into account the need to optimise the configuration between the DC-connected power park module and the remote-end HVDC converter station, as well as the legitimate expectations of the DC-connected power park module owner when adopting a decision concerning a request for a derogation.

### **Article 82**

#### **Register of derogations from the requirements of this Regulation**

1. Regulatory authorities shall maintain a register of all derogations they have granted or refused and shall provide the **Energy Community Regulatory Board and the Secretariat** with an updated and consolidated register at least once every six months, a copy of which shall be given to ENTSO

for Electricity.

2. The register shall contain, in particular:

- (a) the requirement or requirements for which the derogation is granted or refused;
- (b) the content of the derogation;
- (c) the reasons for granting or refusing the derogation;
- (d) the consequences resulting from granting the derogation.

### **Article 83**

#### **Monitoring of derogations**

1. The **Energy Community Regulatory Board** and the **Secretariat** shall monitor the procedure of granting derogations with the cooperation of the regulatory authorities or relevant authorities of the **Contracting Party**. Those authorities or relevant authorities of the **Contracting Party** shall provide the **Energy Community Regulatory Board** and the **Secretariat** with all the information necessary for that purpose.

2. The **Energy Community Regulatory Board** may issue a reasoned recommendation to a regulatory authority to revoke a derogation due to a lack of justification. The **Secretariat** may issue a reasoned recommendation to a regulatory authority or relevant authority of the **Contracting Party** to revoke a derogation due to a lack of justification.

3. The **Secretariat** may request the **Energy Community Regulatory Board** to report on the application of paragraphs 1 and 2 and to provide reasons for requesting or not requesting derogations to be revoked.

## **TITLE VIII**

### **FINAL PROVISIONS**

#### **Article 84**

##### **Amendment of contracts and general terms and conditions**

1. Regulatory authorities shall ensure that all relevant clauses in contracts and general terms and conditions relating to the grid connection of new HVDC systems or new DC-connected power park modules are brought into compliance with the requirements of this Regulation.

2. All relevant clauses in contracts and relevant clauses of general terms and conditions relating to the grid connection of existing HVDC systems or existing DC-connected power park modules subject to all or some of the requirements of this Regulation in accordance with paragraph 1 of Article 4 shall be amended in order to comply with the requirements of this Regulation. The relevant clauses shall be amended within three years following the decision of the regulatory authority or **Contracting Party** as referred to in Article 4(1).

3. Regulatory authorities shall ensure that national agreements between system operators and owners of new or existing HVDC systems and DC-connected power park modules subject to this Regulation and relating to grid connection requirements for HVDC systems and DC-connected power park modules, in particular in national network codes, reflect the requirements set out in this Regulation.

#### **Article 85**

#### **HVDC System or DC-connected power park modules connecting with synchronous areas or control areas not bound by EU legislation**

1. Where an HVDC system to which the requirements of this Regulation apply is connecting synchronous areas or control areas, with at least one synchronous area or one control area not falling under the scope of application of **Energy Community** legislation, the relevant TSO or, where applicable, the HVDC system owner shall endeavour to implement an agreement to ensure that the owners of HVDC systems with no legal obligation to comply with this Regulation also cooperate to fulfil the requirements.

2. If an agreement as referred to in paragraph 1 cannot be implemented, the relevant TSO or, as the case may be, the HVDC system owner concerned shall use all available means to comply with the requirements of this Regulation.

#### **Article 86'**

#### **Entry into force**

**1. Each Contracting Party shall transpose Regulation (EU) 2016/1447 by no later than by 12 June 2018.**

**2. Transposition shall be made without changes to the structure and text of Regulation (EU) 2016/1447 other than translation and the adaptations made by the present Decision [2018/04/PHLG-EnC].**

**3. Each Contracting Party shall notify the Energy Community Secretariat of completed transposition and of any subsequent changes made to the act transposing Regulation (EU) 2016/1447 within two weeks following the adoption of such measures.**

**4. Articles 4(2) points (a) and (b), 5(4), 75, 76 and 78(1) of Regulation (EU) 2016/1447 shall apply as of the expiry of the transposition deadline.**

**5. Without prejudice to paragraph 4, Regulation (EU) 2016/1447 shall be implemented no later than 12 June 2021.**

**6. In transposing this Decision [2018/04/PHLG-EnC], Contracting Parties shall task national regulatory authorities with the monitoring of and enforcing compliance with this Decision [2018/04/PHLG-EnC].**

## ANNEX I

## Frequency ranges referred to in Article 11

Frequency range	Time period for operation
47,0 Hz-47,5 Hz	60 seconds <b>Georgia: 20 seconds</b>
47,5 Hz-48,5 Hz	To be specified by each relevant TSO, but longer than established times for generation and demand according to Regulation (EU) 2016/631 and Regulation (EU) 2016/1388 respectively, and longer than for DC-connected PPMs according to Article 39
48,5 Hz-49,0 Hz	To be specified by each relevant TSO, but longer than established times for generation and demand according to Regulation (EU) 2016/631 and Regulation (EU) 2016/1388 respectively, and longer than for DC-connected PPMs according to Article 39
49,0 Hz-51,0 Hz	Unlimited
51,0 Hz-51,5 Hz	To be specified by each relevant TSO, but longer than established times for generation and demand according to Regulation (EU) 2016/631 and Regulation (EU) 2016/1388 respectively, and longer than for DC-connected PPMs according to Article 39
51,5 Hz-52,0 Hz	To be specified by each relevant TSO, but longer than for DC-connected PPMs according to Article 39

Table 1: Minimum time periods an HVDC system shall be able to operate for different frequencies deviating from a nominal value without disconnecting from the network.

<sup>1</sup> Adapted by Article 1 of Permanent High Level Group Decision 2018/04/PHLG-EnC.

## ANNEX II

## Requirements applying to frequency sensitive mode, limited frequency sensitive mode overfrequency and limited frequency sensitive mode underfrequency

### A. Frequency sensitive mode

#### 1. When operating in frequency sensitive mode (FSM):

(a) the HVDC system shall be capable of responding to frequency deviations in each connected AC network by adjusting the active power transmission as indicated in Figure 1 and in accordance with the parameters specified by each TSO within the ranges shown in Table 2. This specification shall be subject to notification to the regulatory authority. The modalities of that notification shall be determined in accordance with the applicable national regulatory framework;

(b) the adjustment of active power frequency response shall be limited by the minimum HVDC active power transmission capacity and maximum HVDC active power transmission capacity of the HVDC system (in each direction);

Figure 1: Active power frequency response capability of an HVDC system in FSM illustrating the case of zero deadband and insensitivity with a positive active power setpoint (import mode).  $\Delta P$  is the change in active power output from the HVDC system.  $f_n$  is the target frequency in the AC network where the FSM service is provided and  $\Delta f$  is the frequency deviation in the AC network where the FSM service is provided.

Parameters	Ranges
Frequency response deadband	0-±500 mHz
Droop s 1 (upward regulation)	Minimum 0,1%
Droop s 2 (downward regulation)	Minimum 0,1%
Frequency response insensitivity	Maximum 30 mHz

Table 2: Parameters for active power frequency response in FSM

(c) the HVDC system shall be capable, following an instruction from the relevant TSO, of adjusting the droops for upward and downward regulation, the frequency response deadband and the operational range of variation within the active power range available for FSM, set out in Figure 1 and more generally within the limits set by points (a) and (b). These values shall be subject to notification to the regulatory authority. The modalities of that notification shall be determined in accordance with the applicable national regulatory framework;

(d) as a result of a frequency step change, the HVDC system shall be capable of adjusting active power to the active power frequency response defined in Figure 1, in such a way that the response is:

(i) as fast as inherently technically feasible; and

(ii) at or above the solid line according to Figure 2 in accordance with the parameters specified by each relevant TSO within the ranges according to Table 3:

— the HVDC system shall be able to adjust active power output  $\Delta P$  up to the limit of the active power range requested by the relevant TSO in accordance with the times  $t_1$  and  $t_2$  according to the ranges in Table 3, where  $t_1$  is the initial delay and  $t_2$  is the time for full activation. The values of  $t_1$  and  $t_2$  shall be specified by the relevant TSO, subject to notification to the regulatory authority. The modalities of that notification shall be determined in accordance with the applicable national regulatory framework;

— if the initial delay of activation is greater than 0,5 second, the HVDC system owner shall reasonably justify it to the relevant TSO.

Figure 2: Active power frequency response capability of an HVDC system.  $\Delta P$  is the change in active power triggered by the step change in frequency.

Parameters	Time
Maximum admissible initial delay $t_1$	0,5 seconds
Maximum admissible time for full activation $t_2$ , unless longer activation times are specified by the relevant TSO	30 seconds

Table 3: Parameters for full activation of active power frequency response resulting from frequency step change.

(e) for HVDC systems linking various control areas or synchronous areas, in frequency sensitive mode operation the HVDC system shall be capable of adjusting full active power frequency response at any time and for a continuous time period;

(f) as long as a frequency deviation continues active power control shall not have any adverse impact on the active power frequency response.

#### B. Limited frequency sensitive mode overfrequency

1. In addition to the requirements of Article 11 the following shall apply with regard to limited frequency sensitive mode — overfrequency (LFSM-O):

(a) the HVDC system shall be capable of adjusting active power frequency response to the AC network or networks, during both import and export, according to Figure 3 at a frequency threshold  $f_1$  between and including 50,2 Hz and 50,5 Hz with a droop  $S_3$  adjustable from 0,1% upwards;

(b) the HVDC system shall be capable of adjusting active power down to its minimum HVDC active power transmission capacity;

(c) the HVDC system shall be capable of adjusting active power frequency response as fast as inherently technically feasible, with an initial delay and time for full activation determined by the relevant TSO and notified to the regulatory authority in accordance with the applicable national regulatory framework;

(d) the HVDC system shall be capable of stable operation during LFSM-O operation. When LFSM-O is active, hierarchy of control functions shall be organised in accordance with Article 35.

2. The frequency threshold and droop settings referred to in point (a) of paragraph 1 shall be determined by the relevant TSO and be notified to the regulatory authority in accordance with the applicable national regulatory framework.

Figure 3: Active power frequency response capability of HVDC systems in LFSM-O.  $\Delta P$  is the change in active power output from the HVDC system and, depending on the operational conditions, either a decrease of import power or an increase of export power.  $f_n$  is the nominal frequency of the AC network or networks the HVDC system is connected to and  $\Delta f$  is the frequency change in the AC network or networks the HVDC is connected to. At overfrequencies where  $f$  is above  $f_1$  the HVDC system shall reduce active power according to the droop setting.

### C. Limited frequency sensitive mode underfrequency

1. In addition to the requirements of Article 11, the following shall apply with regard to limited frequency sensitive mode — underfrequency (LFSM-U):

(a) the HVDC system shall be capable of adjusting active power frequency response to the AC network or networks, during both import and export, according to Figure 4 at a frequency threshold  $f_2$  between and including 49,8 Hz and 49,5 Hz with a droop  $S_4$  adjustable from 0,1% upwards;

(b) in the LFSM-U mode the HVDC system shall be capable of adjusting active power up to its maximum HVDC active power transmission capacity;

(c) the active power frequency response shall be activated as fast as inherently technically feasible, with an initial delay and time for full activation determined by the relevant TSO and notified to regulatory authority in accordance with the applicable national regulatory framework;

(d) the HVDC system shall be capable of stable operation during LFSM-U operation. When LFSM-U is active, hierarchy of control functions shall be organised in accordance with Article 35.

2. The frequency threshold and droop settings referred to in point (a) of paragraph 1 shall be determined by the relevant TSO and be notified to the regulatory authority in accordance with the applicable national regulatory framework.

Figure 4: Active power frequency response capability of HVDC systems in LFSM-U.  $\Delta P$  is the change in active power output from the HVDC system, depending on the operation condition a decrease of import power or an increase of export power.  $f_n$  is the nominal frequency in the AC network or networks the HVDC system is connected and  $\Delta f$  is the frequency change in the AC network or networks the HVDC is connected. At underfrequencies where  $f$  is below  $f_2$ , the HVDC system has to increase active power output according to the droop  $s_4$ .

## ANNEX III

## Voltage ranges referred to in Article 18

Synchronous Area	Voltage Range	Time period for operation
Continental Europe	0,85 pu-1,118 pu	Unlimited
	1,118 pu-1,15 pu	To be established by each relevant system operator, in coordination with the relevant TSO but not less than 20 minutes
Nordic	0,90 pu-1,05 pu	Unlimited
	1,05 pu-1,10 pu	60 minutes
Great Britain	0,90 pu-1,10 pu	Unlimited
Ireland and Northern Ireland	0,90 pu-1,118 pu	Unlimited
Baltic, <b>Georgia</b>	0,85 pu-1,118 pu	Unlimited
	1,118 pu-1,15 pu	20 minutes

Table 4: Minimum time periods an HVDC system shall be capable of operating for voltages deviating from the reference 1 pu value at the connection points without disconnecting from the network. This table applies in case of pu voltage base values at or above 110 kV and up to (not including) 300 kV.

Synchronous Area	Voltage Range	Time period for operation
Continental Europe	0,85 pu-1,05 pu	Unlimited
	1,05 pu-1,0875 pu	To be specified by each TSO, but not less than 60 minutes
	1,0875 pu-1,10 pu	60 minutes
Nordic	0,90 pu-1,05 pu	Unlimited
	1,05 pu-1,10 pu	To be specified by each TSO, but not more than 60 minutes
Great Britain	0,90 pu-1,05 pu	Unlimited
	1,05 pu-1,10 pu	15 minutes
Ireland and Northern Ireland	0,90 pu-1,05 pu	Unlimited
Baltic, <b>Georgia</b>	0,88 pu-1,097 pu	Unlimited
	1,097 pu-1,15 pu	20 minutes

Table 5: Minimum time periods an HVDC system shall be capable of operating for voltages deviating from the reference 1 pu value at the connection points without disconnecting from the network. This table applies in case of pu voltage base values from 300 kV to 400 kV (included).

## ANNEX IV

### Requirements for $U-Q/P_{max}$ -profile referred to in Article 20

Figure 5: The diagram represents boundaries of a  $U-Q/P_{max}$ -profile with  $U$  being the voltage at the connection points expressed by the ratio of its actual value to its reference 1 pu value in per unit, and  $Q/P_{max}$  the ratio of the reactive power to the maximum HVDC active power transmission capacity. The position, size and shape of the inner envelope are indicative and shapes other than rectangular may be used within the inner envelope. For profile shapes other than rectangular, the voltage range represents the highest and lowest voltage points in this shape. Such a profile would not give rise to the full reactive power range being available across the range of steady-state voltages.

Synchronous Area	Maximum range of $Q/P_{max}$	Maximum range of steady-state Voltage level in PU
Continental Europe	0,95	0,225
Nordic	0,95	0,15

Table 6: Parameters for the Inner Envelope in the Figure.

## ANNEX V

## Voltage-against-time-profile referred to in Article 25

Figure 6: Fault-ride-through profile of an HVDC converter station. The diagram represents the lower limit of a voltage-against-time profile at the connection point, expressed by the ratio of its actual value and its reference 1 pu value in per unit before, during and after a fault.  $U_{ret}$  is the retained voltage at the connection point during a fault,  $t_{clear}$  is the instant when the fault has been cleared,  $U_{rec1}$  and  $t_{rec1}$  specify a point of lower limits of voltage recovery following fault clearance.  $U_{block}$  is the blocking voltage at the connection point. The time values referred to are measured from  $t_{fault}$ .

Voltage parameters [pu]		Time parameters [seconds]	
$U_{ret}$	0,00-0,30	$t_{clear}$	0,14-0,25
$U_{rec1}$	0,25-0,85	$t_{rec1}$	1,5-2,5
$U_{rec2}$	0,85-0,90	$t_{rec2}$	$T_{rec1}-10,0$

Table 7: Parameters for Figure 6 for the fault-ride-through capability of an HVDC converter station.

**ANNEX VI****Frequency ranges and time periods referred to in Article 39(2)(a)**

<b>Frequency range</b>	<b>Time period for operation</b>
47,0 Hz-47,5 Hz	20 seconds
47,5 Hz-49,0 Hz	90 minutes
49,0 Hz-51,0 Hz	Unlimited
51,0 Hz-51,5 Hz	90 minutes
51,5 Hz-52,0 Hz	15 minutes

Table 8: Minimum time periods for the 50 Hz nominal system for which a PPM shall be capable of operating for different frequencies deviating from a nominal value without disconnecting from the network.

## ANNEX VII

## Voltage ranges and time periods referred to in Article 40

Voltage Range	Time period for operation
0,85 pu-0,90 pu	60 minutes
0,90 pu-1,10 pu	Unlimited
1,10 pu-1,118 pu	Unlimited, unless specified otherwise by the relevant system operator, in coordination with the relevant TSO.
1,118 pu-1,15 pu	To be specified by the relevant system operator, in coordination with the relevant TSO.

Table 9: Minimum time periods for which a DC-connected power park module shall be capable of operating for different voltages deviating from a reference 1 pu value without disconnecting from the network where the voltage base for pu values is from 110 kV to (not including) 300 kV.

Voltage Range	Time period for operation
0,85 pu-0,90 pu	60 minutes
0,90 pu-1,05 pu	Unlimited
1,05 pu-1,15 pu	To be specified by the relevant system operator, in coordination with the relevant TSO. Various sub-ranges of voltage withstand capability can be specified.

Table 10: Minimum time periods for which a DC-connected power park module shall be capable of operating for different voltages deviating from a reference 1 pu value without disconnecting from the network where the voltage base for pu values is from 300 kV to 400 kV (included).

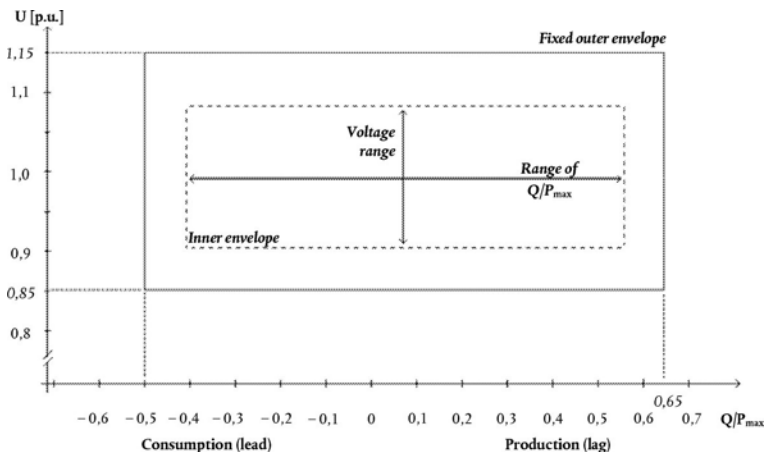

Figure 7:  $U$ - $Q/P_{\max}$ -profile of a DC-connected power park module at the connection point. The diagram represents boundaries of a  $U$ - $Q/P_{\max}$ -profile of the voltage at the connection point[s], expressed by the ratio of its actual value to its reference 1 pu value in per unit, against the ratio of the reactive power ( $Q$ ) to the maximum capacity ( $P_{\max}$ ). The position, size and shape of the inner envelope are indicative and other than rectangular may be used within the inner envelope. For profile shapes other than rectangular, the voltage range represents the highest and lowest voltage points. Such a profile would not give rise to the full reactive power range being available across the range of steady-state voltages.

<b>Range of width of <math>Q/P_{\max}</math> profile</b>	<b>Range of steady-state Voltage level in pu</b>
0-0,95	0,1-0,225

Table 11: Maximum and minimum range of both  $Q/P_{\max}$  and steady-state voltage for a DC-connected PPM

## ANNEX VIII

## Reactive power and voltage requirements referred to in Article 48

Voltage range	Time period for operation
0,85 pu-0,90 pu	60 minutes
0,90 pu-1,10 pu	Unlimited
1,10 pu-1,12 pu	Unlimited, unless specified otherwise by the relevant system operator, in coordination with the relevant TSO.
1,12 pu-1,15 pu	To be specified by the relevant system operator, in coordination with the relevant TSO.

Table 12: Minimum time periods for which a remote-end HVDC converter station shall be capable of operating for different voltages deviating from a reference 1 pu value without disconnecting from the network where the voltage base for pu values is from 110 kV to (not including) 300 kV.

Voltage range	Time period for operation
0,85 pu-0,90 pu	60 minutes
0,90 pu-1,05 pu	Unlimited
1,05 pu-1,15 pu	To be specified by the relevant system operator, in coordination with the relevant TSO. Various sub-ranges of voltage withstand capability may be specified.

Table 13: Minimum time periods for which a remote-end HVDC converter station shall be capable of operating for different voltages deviating from a reference 1 pu value without disconnecting from the network where the voltage base for pu values is from 300 kV to 400 kV (included).

Maximum range of $Q/P_{\max}$	Maximum range of steady-state voltage level in PU
0,95	0,225

Table 14: Maximum range of both  $Q/P_{\max}$  and steady-state voltage for a remote-end HVDC converter station.

## REGULATION (EU) 1227/2011 of 25 October 2011 on wholesale energy market integrity and transparency

Incorporated and adapted by Ministerial Council Decision 2018/01/MC-EnC of 29 November 2018.

*The adaptations made by Ministerial Council Decision 2018/01/MC-EnC are highlighted in **bold and blue**.*

Whereas:

(1) It is important to ensure that consumers and other market participants can have confidence in the integrity of electricity and gas markets, that prices set on wholesale energy markets reflect a fair and competitive interplay between supply and demand, and that no profits can be drawn from market abuse.

(2) The goal of increased integrity and transparency of wholesale energy markets should be to foster open and fair competition in wholesale energy markets for the benefit of final consumers of energy.

(3) The advice of the Committee of European Securities Regulators and the European Regulators Group for Electricity and Gas confirmed that the scope of existing legislation might not properly address market integrity issues on the electricity and gas markets and recommended the consideration of an appropriate legislative framework tailored to the energy sector which prevents market abuse and takes sector-specific conditions into account which are not covered by other directives and regulations.

(4) Wholesale energy markets are increasingly interlinked across the Union. Market abuse in one Member State often affects not only wholesale prices for electricity and natural gas across national borders, but also retail prices to consumers and micro-enterprises. Therefore the concern to ensure the integrity of markets cannot be a matter only for individual Member States. Strong crossborder market monitoring is essential for the completion of a fully functioning, interconnected and integrated internal energy market.

(5) Wholesale energy markets encompass both commodity markets and derivative markets, which are of vital importance to the energy and financial markets, and price formation in both sectors is interlinked. They include, *inter alia*, regulated markets, multilateral trading facilities and over-the-counter (OTC) transactions and bilateral contracts, direct or through brokers.

(6) To date, energy market monitoring practices have been Member State and sector-specific. Depending on the overall market framework and regulatory situation, this can result in trading activities being subject to multiple jurisdictions with monitoring carried out by several different authorities, possibly located in different Member States. This can result in a lack of clarity as to where responsibility rests and even to a situation where no such monitoring exists.

(7) Behaviour which undermines the integrity of the energy market is currently not clearly prohibited on some of the most important energy markets. In order to protect final consumers and guarantee affordable energy prices for European citizens, it is essential to prohibit such behaviour.

(8) Derivative trading, which may be either physically or financially settled, and commodity trading are used together on wholesale energy markets. It is therefore important that the definitions of insider trading and market manipulation, which constitute market abuse, be compatible between derivatives

and commodity markets. This Regulation should in principle apply to all transactions concluded but at the same time should take into account the specific characteristics of the wholesale energy markets.

(9) Retail contracts which cover the supply of electricity or natural gas to final customers are not susceptible to market manipulation in the same way as wholesale contracts which are easily bought and sold. None the less, the consumption decisions of the largest energy users can also affect prices on wholesale energy markets, with effects across national borders. Therefore it is appropriate to consider the supply contracts of such large users in the context of ensuring the integrity of wholesale energy markets.

(10) Taking account of the results of the examination set out in the Commission Communication of 21 December 2010 entitled 'Towards an enhanced market oversight framework for the EU Emissions Trading Scheme', the Commission should consider bringing forward a legislative proposal to tackle the identified shortcomings in the transparency, integrity and supervision of the European carbon market in an appropriate time-frame.

(11) Regulation (EC) No 714/2009 of the European Parliament and of the Council of 13 July 2009 on conditions for access to the network for cross-border exchanges in electricity and Regulation (EC) No 715/2009 of the European Parliament and of the Council of 13 July 2009 on conditions for access to the natural gas transmission networks recognise that equal access to information on the physical status and efficiency of the system is necessary to enable all market participants to assess the overall demand and supply situation and identify the reasons for fluctuations in the wholesale price.

(12) The use or attempted use of inside information to trade either on one's own account or on the account of a third party should be clearly prohibited. Use of inside information can also consist in trading in wholesale energy products by persons who know, or ought to know, that the information they possess is inside information. Information regarding the market participant's own plans and strategies for trading should not be considered as inside information. Information which is required to be made public in accordance with Regulation (EC) No 714/2009 or (EC) No 715/2009, including guidelines and network codes adopted pursuant to those Regulations, may serve, if it is price-sensitive information, as the basis of market participants' decisions to enter into transactions in wholesale energy products and therefore could constitute inside information until it has been made public.

(13) Manipulation on wholesale energy markets involves actions undertaken by persons that artificially cause prices to be at a level not justified by market forces of supply and demand, including actual availability of production, storage or transportation capacity, and demand. Forms of market manipulation include placing and withdrawal of false orders; spreading of false or misleading information or rumours through the media, including the internet, or by any other means; deliberately providing false information to undertakings which provide price assessments or market reports with the effect of misleading market participants acting on the basis of those price assessments or market reports; and deliberately making it appear that the availability of electricity generation capacity or natural gas availability, or the availability of transmission capacity is other than the capacity which is actually technically available where such information affects or is likely to affect the price of wholesale energy products. Manipulation and its effects may occur across borders, between electricity and gas markets and across financial and commodity markets, including the emission allowances markets.

(14) Examples of market manipulation and attempts to manipulate the market include conduct by a person, or persons acting in collaboration, to secure a decisive position over the supply of, or demand

for, a wholesale energy product which has, or could have, the effect of fixing, directly or indirectly, prices or creating other unfair trading conditions; and the offering, buying or selling of wholesale energy products with the purpose, intention or effect of misleading market participants acting on the basis of reference prices. However, accepted market practices such as those applying in the financial services area, which are currently defined by Article 1(5) of Directive 2003/6/EC of the European Parliament and of the Council of 28 January 2003 on insider dealing and market manipulation (market abuse) and which may be adapted if that Directive is amended, could be a legitimate way for market participants to secure a favourable price for a wholesale energy product.

(15) The disclosure of inside information in relation to a wholesale energy product by journalists acting in their professional capacity should be assessed taking into account the rules governing their profession and the rules governing the freedom of the press, unless those persons derive, directly or indirectly, an advantage or profits from the dissemination of the information in question or when disclosure is made with the intention of misleading the market as to the supply of, demand for, or price of wholesale energy products.

(16) As financial markets develop, the concepts of market abuse applying to those markets will be adapted. In order to ensure the necessary flexibility to respond quickly to these developments therefore, the power to adopt acts in accordance with Article 290 of the Treaty on the Functioning of the European Union should be delegated to the Commission in respect of technical updating of the definitions of inside information and market manipulation for the purpose of ensuring coherence with other relevant Union legislation in the fields of financial services and energy. It is of particular importance that the Commission carry out appropriate consultations during its preparatory work, including at expert level. The Commission should, when preparing and drawing up delegated acts, ensure a simultaneous, timely and appropriate transmission of relevant documents to the European Parliament and the Council.

(17) Efficient market monitoring at Union level is vital for detecting and deterring market abuse on wholesale energy markets. The Agency for the Cooperation of Energy Regulators established by Regulation (EC) No 713/2009 of the European Parliament and of the Council ('the Agency') is best placed to carry out such monitoring as it has both a Union-wide view of electricity and gas markets, and the necessary expertise in the operation of electricity and gas markets and systems in the Union. National regulatory authorities, which have a comprehensive understanding of developments on energy markets in their Member State, should have an important role in ensuring efficient market monitoring at national level. Close cooperation and coordination between the Agency and national authorities is therefore necessary to ensure proper monitoring and transparency of energy markets. The collection of data by the Agency is without prejudice to the right of national authorities to collect additional data for national purposes.

(18) Efficient market monitoring requires regular and timely access to records of transactions as well as access to structural data on capacity and use of facilities for production, storage, consumption or transmission of electricity or natural gas. For this reason market participants, including transmission system operators, suppliers, traders, producers, brokers and large users, who trade wholesale energy products should be required to provide that information to the Agency. The Agency may for its part establish strong links with major organised market places.

(19) In order to ensure uniform conditions for the implementation of the provisions on data collection,

implementing powers should be conferred on the Commission. Those powers should be exercised in accordance with Regulation (EU) No 182/2011 of the European Parliament and of the Council of 16 February 2011 laying down the rules and general principles concerning mechanisms for control by the Member States of the Commission's exercise of implementing powers. Reporting obligations should be kept to a minimum and not create unnecessary costs or administrative burdens for market participants. The uniform rules on the reporting of information should therefore undergo an ex-ante cost benefit analysis, should avoid double reporting, and should take account of reporting frameworks developed under other relevant legislation. Furthermore, the required information or parts thereof should be collected from other persons and existing sources where possible. Where a market participant or a third party acting on its behalf, a trade reporting system, an organised market, a trade-matching system, or other person professionally arranging transactions has fulfilled its reporting obligations to a competent authority in accordance with Directive 2004/39/EC of the European Parliament and of the Council of 21 April 2004 on markets in financial instruments or applicable Union legislation on derivative transactions, central counterparties and trade repositories, its reporting obligation should be considered fulfilled also under this Regulation, but only to the extent that all the information required under this Regulation has been reported.

(20) It is important that the Commission and the Agency work closely together in implementing this Regulation and consult appropriately with the European Networks of Transmission System Operators for Electricity and for Gas and the European Securities and Markets Authority established by Regulation (EU) No 1095/2010 of the European Parliament and of the Council (ESMA), with national regulatory authorities, competent financial authorities and other Member State authorities such as national competition authorities, and with stakeholders such as organised market places (e.g. energy exchanges) and market participants.

(21) A European register of market participants, based on national registers, should be established to enhance the overall transparency and integrity of wholesale energy markets. One year after the establishment of that register, the Commission should assess in cooperation with the Agency, in line with the reports submitted by the Agency to the Commission, and with the national regulatory authorities, the functioning and the usefulness of the European register of market participants. If deemed appropriate based on that assessment, the Commission should consider presenting further instruments to enhance the overall transparency and integrity of wholesale energy markets and to ensure a Union-wide level playing field for market participants.

(22) In order to facilitate efficient monitoring of all aspects of trading in wholesale energy products, the Agency should establish mechanisms to give access to the information which it receives on transactions on wholesale energy markets to other relevant authorities, in particular to ESMA, national regulatory authorities, competent financial authorities of the Member States, national competition authorities, and other relevant authorities.

(23) The Agency should ensure the operational security and protection of the data which it receives, prevent unauthorised access to the information kept by the Agency, and establish procedures to ensure that the data it collects are not misused by persons with an authorised access to them. The Agency should also ascertain whether those authorities which have access to the data held by the Agency are able to maintain an equally high level of security and are bound by appropriate confidentiality arrangements. The operational security of the IT systems used for processing and transmitting the data therefore also needs to be ensured. For setting up an IT system that ensures the highest possible

level of data confidentiality, the Agency should be encouraged to work closely with the European Network and Information Security Agency (ENISA). These rules should also apply to other authorities that are entitled to access to the data for the purpose of this Regulation.

(24) This Regulation respects fundamental rights and observes the principles recognised in particular by the Charter of Fundamental Rights of the European Union as referred to in Article 6 of the Treaty on European Union and the constitutional traditions in the Member States and should be applied in accordance with the right to freedom of expression and information recognised in Article 11 of the Charter.

(25) Where information is not, or no longer, sensitive from a commercial or security viewpoint, the Agency should be able to make that information available to market participants and the wider public with a view to contributing to enhanced market knowledge. Such transparency will help build confidence in the market and foster the development of knowledge about the functioning of wholesale energy markets. The Agency should establish and make publicly available rules on how it will make that information available in a fair and transparent manner.

(26) National regulatory authorities should be responsible for ensuring that this Regulation is enforced in the Member States. To this end they should have the necessary investigatory powers to allow them to carry out that task efficiently. These powers should be exercised in conformity with national law and may be subject to appropriate oversight.

(27) The Agency should ensure that this Regulation is applied in a coordinated way across the Union, coherent with the application of Directive 2003/6/EC. To that effect, the Agency should publish non-binding guidance on the application of the definitions set out in this Regulation, as appropriate. That guidance should address, *inter alia*, the issue of accepted market practices. Furthermore, since market abuse on wholesale energy markets often affects more than one Member State, the Agency should have an important role in ensuring that investigations are carried out in an efficient and coherent way. To achieve this, the Agency should be able to request cooperation and to coordinate the operation of investigatory groups comprised of representatives of the concerned national regulatory authorities and, where appropriate, other authorities including national competition authorities.

(28) The Agency should be provided with the appropriate financial and human resources, in order to adequately fulfil the additional tasks assigned to it under this Regulation. For this purpose, the procedure for the establishment, implementation and control of its budget as set out in Articles 23 and 24 of Regulation (EC) No 713/2009 should take due account of these tasks. The budgetary authority should ensure that the best standards of efficiency are met.

(29) National regulatory authorities, competent financial authorities of the Member States and, where appropriate, national competition authorities should cooperate to ensure a coordinated approach to tackling market abuse on wholesale energy markets which encompasses both commodity markets and derivatives markets. That cooperation should include the mutual exchange of information regarding suspicions that acts which are likely to constitute a breach of this Regulation, Directive 2003/6/EC, or competition law are being or have been carried out on wholesale energy markets. Furthermore, that cooperation should contribute to a coherent and consistent approach to investigations and judicial proceedings.

(30) It is important that the obligation of professional secrecy applies to those who receive confidential information in accordance with this Regulation. The Agency, national regulatory authorities, compe-

tent financial authorities of the Member States and national competition authorities should ensure the confidentiality, integrity and protection of the information which they receive.

(31) It is important that the penalties for breaches of this Regulation are proportionate, effective and dissuasive, and reflect the gravity of the infringements, the damage caused to consumers and the potential gains from trading on the basis of inside information and market manipulation. The application of these penalties should be carried out in accordance with national law. Recognising the interactions between trading in electricity and natural gas derivative products and trading in actual electricity and natural gas, the penalties for breaches of this Regulation should be in line with the penalties adopted by the Member States in implementing Directive 2003/6/EC. Taking account of the consultation on the Commission Communication of 12 December 2010 entitled 'Reinforcing sanctioning regimes in the financial services sector', the Commission should consider presenting proposals to harmonise minimum standards for the penalties systems of Member States in an appropriate time-frame. This Regulation affects neither national rules on the standard of proof nor obligations of national regulatory authorities and courts of the Member States to ascertain the relevant facts of a case, provided that such rules and obligations are compatible with general principles of Union law.

(32) Since the objective of this Regulation, namely the provision of a harmonised framework to ensure wholesale energy market transparency and integrity, cannot be sufficiently achieved by the Member States and can therefore be better achieved at Union level, the Union may adopt measures, in accordance with the principle of subsidiarity as set out in Article 5 of the Treaty on European Union. In accordance with the principle of proportionality, as set out in that Article, this Regulation does not go beyond what is necessary in order to achieve that objective.

## **Article 1**

### **Subject matter, scope and relationship with other Energy Community legislation**

1. This Regulation establishes rules prohibiting abusive practices affecting wholesale energy markets which are coherent <...> with the proper functioning of those wholesale energy markets whilst taking into account their specific characteristics. It provides for the monitoring of wholesale energy markets by <...> national regulatory authorities <...>.

2. This Regulation applies to trading in wholesale energy products. <...> This Regulation is without prej-

udice to <...> the application of **Energy Community and national** competition law to the practices covered by this Regulation

3. <...> National regulatory authorities <...> and, where appropriate, national competition authorities <...> and other relevant national authorities shall cooperate to ensure that a coordinated approach is taken to the enforcement of the relevant rules where actions relate <...> to one or more wholesale energy products to which Articles 3, 4 and 5 of this Regulation apply.

4. <...>

5. <...>

## **Article 2**

### **Definitions**

For the purposes of this Regulation the following definitions shall apply:

(1) ‘inside information’ means information of a precise nature which has not been made public, which relates, directly or indirectly, to one or more wholesale energy products and which, if it were made public, would be likely to significantly affect the prices of those wholesale energy products.

For the purposes of this definition, ‘information’ means:

(a) information which is required to be made public in accordance with Regulations (EC) No 714/2009 and (EC) No 715/2009, including guidelines and network codes adopted pursuant to those Regulations;

(b) information relating to the capacity and use of facilities for production, storage, consumption or transmission of electricity or natural gas or related to the capacity and use of LNG facilities, including planned or unplanned unavailability of these facilities;

(c) information which is required to be disclosed in accordance with legal or regulatory provisions at **Energy Community** or national level, market rules, and contracts or customs on the relevant wholesale energy market, in so far as this information is likely to have a significant effect on the prices of wholesale energy products; and

(d) other information that a reasonable market participant would be likely to use as part of the basis of its decision to enter into a transaction relating to, or to issue an order to trade in, a wholesale energy product.

Information shall be deemed to be of a precise nature if it indicates a set of circumstances which exists or may reasonably be expected to come into existence, or an event which has occurred or may reasonably be expected to do so, and if it is specific enough to enable a conclusion to be drawn as to the possible effect of that set of circumstances or event on the prices of wholesale energy products;

(2) ‘market manipulation’ means:

(a) entering into any transaction or issuing any order to trade in wholesale energy products which:

(i) gives, or is likely to give, false or misleading signals as to the supply of, demand for, or price of wholesale energy products;

(ii) secures or attempts to secure, by a person, or persons acting in collaboration, the price of one or several wholesale energy products at an artificial level, unless the person who entered into the transaction or issued the order to trade establishes that his reasons for doing so are legitimate and

that that transaction or order to trade conforms to accepted market practices on the wholesale energy market concerned; or

(iii) employs or attempts to employ a fictitious device or any other form of deception or contrivance which gives, or is likely to give, false or misleading signals regarding the supply of, demand for, or price of wholesale energy products;

Or

(b) disseminating information through the media, including the internet, or by any other means, which gives, or is likely to give, false or misleading signals as to the supply of, demand for, or price of wholesale energy products, including the dissemination of rumours and false or misleading news, where the disseminating person knew, or ought to have known, that the information was false or misleading.

When information is disseminated for the purposes of journalism or artistic expression, such dissemination

of information shall be assessed taking into account the rules governing the freedom of the press and freedom of expression in other media, unless:

(i) those persons derive, directly or indirectly, an advantage or profits from the dissemination of the information in question; or

(ii) the disclosure or dissemination is made with the intention of misleading the market as to the supply of, demand for, or price of wholesale energy products;

(3) 'attempt to manipulate the market' means:

(a) entering into any transaction, issuing any order to trade or taking any other action relating to a wholesale energy product with the intention of:

(i) giving false or misleading signals as to the supply of, demand for, or price of wholesale energy products;

(ii) securing the price of one or several wholesale energy products at an artificial level, unless the person who entered into the transaction or issued the order to trade establishes that his reasons for doing so are legitimate and that that transaction or order to trade conforms to accepted market practices on the wholesale energy market concerned; or

(iii) employing a fictitious device or any other form of deception or contrivance which gives, or is likely to give, false or misleading signals regarding the supply of, demand for, or price of wholesale energy products;

Or

(b) disseminating information through the media, including the internet, or by any other means with the intention of giving false or misleading signals as to the supply of, demand for, or price of wholesale energy products;

(4) 'wholesale energy products' means the following contracts and derivatives, irrespective of where and how they are traded:

(a) contracts for the supply of electricity or natural gas where delivery is in the **Contracting Parties**;

(b) <...>

(c) contracts relating to the transportation of electricity or natural gas in the **Contracting Parties**;

(d) <...> Contracts for the supply and distribution of electricity or natural gas for the use of final customers are not wholesale energy products. However, contracts for the supply and distribution of

electricity or natural gas to final customers with a consumption capacity greater than the threshold set out in the second paragraph of point (5) shall be treated as wholesale energy products;

(5) 'consumption capacity' means the consumption of a final customer of either electricity or natural gas at full use of that customer's production capacity. It comprises all consumption by that customer as a single economic entity, in so far as consumption takes place on markets with interrelated wholesale prices.

For the purposes of this definition, consumption at individual plants under the control of a single economic entity that have a consumption capacity of less than 600 GWh per year shall not be taken into account in so far as those plants do not exert a joint influence on wholesale energy market prices due to their being located in different relevant geographical markets;

(6) 'wholesale energy market' means any market within the **Contracting Parties** on which wholesale energy products are traded;

(7) 'market participant' means any person, including transmission **and distribution** system operators, who enters into transactions, including the placing of orders to trade, in one or more wholesale energy markets;

(8) 'person' means any natural or legal person;

(9) <...>

(10) 'national regulatory authority' means a national regulatory authority designated in accordance with Article 35(1) of Directive 2009/72/EC of the European Parliament and of the Council of 13 July 2009 concerning common rules for the internal market in electricity or Article 39(1) of Directive 2009/73/EC of the European Parliament and of the Council of 13 July 2009 concerning common rules for the internal market in natural gas;

(11) 'transmission system operator' has the meaning set out in point 4 of Article 2 of Directive 2009/72/EC and in point 4 of Article 2 of Directive 2009/73/EC;

(12) 'parent undertaking' means a parent undertaking within the meaning of Articles 1 and 2 of the Seventh Council Directive 83/349/EEC of 13 June 1983 based on Article 54(3)(g) of the Treaty on consolidated accounts;

(13) 'related undertaking' means either a subsidiary or other undertaking in which a participation is held, or an undertaking linked with another undertaking by a relationship within the meaning of Article 12(1) of Directive 83/349/EEC;

(14) 'distribution of natural gas' has the meaning set out in point (5) of Article 2 of Directive 2009/73/EC;

(15) 'distribution of electricity' has the meaning set out in point (5) of Article 2 of Directive 2009/72/EC.

**(16) 'sensitive critical infrastructure protection related information' means facts about a critical infrastructure, which if disclosed could be used to plan and act with a view to causing disruption or destruction of critical infrastructure installations;**

**(17) 'critical infrastructure' means an asset, system or part thereof located in Contracting Parties which is essential for the maintenance of vital societal functions, health, safety, security, economic or social well-being of people, and the disruption or destruction of which would have a significant impact in a Contracting Parties as a result of the failure to maintain those functions.**

## **Article 3**

### **Prohibition of insider trading**

1. Persons who possess inside information in relation to a wholesale energy product shall be prohibited from:

(a) using that information by acquiring or disposing of, or by trying to acquire or dispose of, for their own account or for the account of a third party, either directly or indirectly, wholesale energy products to which that information relates;

(b) disclosing that information to any other person unless such disclosure is made in the normal course of the exercise of their employment, profession or duties;

(c) recommending or inducing another person, on the basis of inside information, to acquire or dispose of wholesale energy products to which that information relates.

2. The prohibition set out in paragraph 1 applies to the following persons who possess inside information in relation to a wholesale energy product:

(a) members of the administrative, management or supervisory bodies of an undertaking;

(b) persons with holdings in the capital of an undertaking;

(c) persons with access to the information through the exercise of their employment, profession or duties;

(d) persons who have acquired such information through criminal activity;

(e) persons who know, or ought to know, that it is inside information.

3. Points (a) and (c) of paragraph 1 of this Article shall not apply to transmission system operators when purchasing electricity or natural gas in order to ensure the safe and secure operation of the system in accordance with their obligations under points (d) and (e) of Article 12 of Directive 2009/72/EC or points (a) and (c) of Article 13(1) of Directive 2009/73/EC.

4. This Article shall not apply to:

(a) transactions conducted in the discharge of an obligation that has become due to acquire or dispose of wholesale energy products where that obligation results from an agreement concluded, or an order to trade placed, before the person concerned came into possession of inside information;

(b) transactions entered into by electricity and natural gas producers, operators of natural gas storage facilities or operators of LNG import facilities the sole purpose of which is to cover the immediate physical loss resulting from unplanned outages, where not to do so would result in the market participant not being able to meet existing contractual obligations or where such action is undertaken in agreement with the transmission system operator(s) concerned in order to ensure safe and secure operation of the system.

In such a situation, the relevant information relating to the transactions shall be reported to the national regulatory authority. This reporting obligation is without prejudice to the obligation set out in Article 4(1);

(c) market participants acting under national emergency rules, where national authorities have intervened in order to secure the supply of electricity or natural gas and market mechanisms have been suspended in a **Contracting Party** or parts thereof. In this case the authority competent for emergency planning shall ensure publication in accordance with Article 4.

5. Where the person who possesses inside information in relation to a wholesale energy product is a legal

person, the prohibitions laid down in paragraph 1 shall also apply to the natural persons who take part in the decision to carry out the transaction for the account of the legal person concerned.

6. When information is disseminated for the purposes of journalism or artistic expression such dissemination of information shall be assessed taking into account the rules governing the freedom of the press and freedom of expression in other media, unless:

(a) those persons derive, directly or indirectly, an advantage or profits from the dissemination of the information in question; or

(b) the disclosure or dissemination is made with the intention of misleading the market as to the supply of, demand for, or price of wholesale energy products.

#### **Article 4**

#### **Obligation to publish inside information**

1. Market participants shall publicly disclose in an effective and timely manner inside information which they possess in respect of business or facilities which the market participant concerned, or its parent undertaking or related undertaking, owns or controls or for whose operational matters that market participant or undertaking is responsible, either in whole or in part. Such disclosure shall include information relevant to the capacity and use of facilities for production, storage, consumption or transmission of electricity or natural gas or related to the capacity and use of LNG facilities, including planned or unplanned unavailability of these facilities.

2. A market participant may under its own responsibility exceptionally delay the public disclosure of inside information so as not to prejudice its legitimate interests provided that such omission is not likely to mislead the public and provided that the market participant is able to ensure the confidentiality of that information and does not make decisions relating to trading in wholesale energy products based upon that information. In such a situation the market participant shall without delay provide that information, together with a justification for the delay of the public disclosure, to <...> the relevant national regulatory authority <...>.

3. Whenever a market participant or a person employed by, or acting on behalf of, a market participant discloses inside information in relation to a wholesale energy product in the normal exercise of his employment, profession or duties as referred to in point (b) of Article 3(1), that market participant or person shall ensure simultaneous, complete and effective public disclosure of that information. In the event of a non-intentional disclosure the market participant shall ensure complete and effective public disclosure of the information as soon as possible following the non-intentional disclosure. This paragraph shall not apply if the person receiving the information has a duty of confidentiality, regardless of whether such duty derives from law, regulation, articles of association or a contract.

4. The publication of inside information, including in aggregated form, in accordance with Regulation (EC) No 714/2009 or (EC) No 715/2009, or guidelines and network codes adopted pursuant to those Regulations constitutes simultaneous, complete and effective public disclosure.

5. Where an exemption from the obligation to publish certain data has been granted to a transmission system operator, in accordance with Regulation (EC) No 714/2009 or (EC) No 715/2009, that operator is thereby also exempted from the obligation set out in paragraph 1 of this Article in respect of that data.

6. Paragraphs 1 and 2 are without prejudice to the obligations of market participants under Directives 2009/72/EC and 2009/73/EC, and Regulations (EC) No 714/2009 and (EC) No 715/2009, including guidelines and network codes adopted pursuant to those Directives and Regulations, in particular regarding the timing and method of publication of information.

7. Paragraphs 1 and 2 are without prejudice to the right of market participants to delay the disclosure of sensitive information relating to the protection of critical infrastructure <...> and the assessment of the need to improve their protection, if it is classified in their country **according to national legislation**.

### **Article 5**

#### **Prohibition of market manipulation**

Any engagement in, or attempt to engage in, market manipulation on wholesale energy markets shall be prohibited.

### **Article 6**

<...>

### **Article 7**

#### **Market monitoring**

1. **National regulatory authorities** shall monitor trading activity in wholesale energy products to detect and prevent trading based on inside information and market manipulation **in their national market. For this purpose they may use the user manuals developed by the Agency for the Cooperation of Energy Regulators and may adopt rules on related data provision requirements from market participants.** <...>

2. National regulatory authorities shall cooperate at regional level **via the Energy Community Regulatory Board** in carrying out the monitoring of wholesale energy markets referred to in paragraph 1. <...> **Contracting Parties** may provide for their national competition authority or a market monitoring body established within that authority to carry out market monitoring with the national regulatory authority. In carrying out such market monitoring, the national competition authority or the market monitoring body shall have the same rights and obligations as the national regulatory authority pursuant to the first subparagraph of this paragraph, the second sentence of the second subparagraph of paragraph 3 of this Article, the second sentence of Article 4(2) <...> and Article 16.

3. **National regulatory authorities** shall at least on an annual basis submit a report to **the Secretariat** on **their** activities under this Regulation and make this report publicly available.

<...>

4. **The Secretariat shall report to the Ministerial Council on an annual basis including but not limited to the information provided under paragraph (3).**

## Article 8

<...>

## Article 9

### Registration of market participants

1. Market participants entering into transactions **with wholesale energy products or expressing interest to enter into such transactions through orders to trade <...>** shall register with the national regulatory authority in the **Contracting Party where the delivery of the wholesale energy products takes or will take place. For the purpose of registration, national regulatory authorities shall apply the registration format developed by the Agency for the Cooperation of Energy Regulators under Regulation No 1227/2011. The Energy Community Regulatory Board shall make available an online compilation of all national registrations in the Contracting Parties.**

<...> The registration of market participants is without prejudice to obligations to comply with applicable trading and balancing rules.

2. Not later than **6 months after the deadline for national transposition of this Regulation in the Energy Community**, national regulatory authorities shall establish national registers of market participants which they shall keep up to date. The register shall give each market participant a unique identifier and shall contain sufficient information to identify the market participant, including relevant details relating to its value added tax number, its place of establishment, the persons responsible for its operational and trading decisions, and the ultimate controller or beneficiary of the market participant's trading activities. **National regulatory authorities shall apply the register format developed by the Agency for the Cooperation of Energy Regulators under Article 9(3) of Regulation No 1227/2011.**

3. National regulatory authorities shall transmit the information in their national registers to the **Energy Community Regulatory Board <...>**. Based on the information provided by national regulatory authorities the **Energy Community Regulatory Board** shall establish a **central** register of market participants. National regulatory authorities and other relevant authorities shall have access to **this** register. Subject to Article 17, the **Energy Community Regulatory Board** may decide to make the **central** register, or extracts thereof, publicly available provided that commercially sensitive information on individual market participants is not disclosed.

4. Market participants referred to in paragraph 1 of this Article shall submit the registration form to the national regulatory authority prior to entering into a transaction **with wholesale energy products <...>**.

5. Market participants referred to in paragraph 1 shall communicate promptly to the national regulatory authority any change which has taken place as regards the information provided in the registration form.

## Article 10

<...>

**Article 11**  
**Data protection**

This Regulation shall be without prejudice to the obligations of **Contracting Parties and national regulatory authorities to preserve the confidentiality of commercially sensitive information laid down in national legislation.** <...>

**Article 12**  
**Operational reliability**

1. The **national regulatory authorities** shall ensure the confidentiality, integrity and protection of the information received pursuant to Article 4(2) <...>. The **national regulatory authorities** shall take all necessary measures to prevent any misuse of, and unauthorised access to, the information maintained in its systems. National regulatory authorities, <...>, national competition authorities, <...> and other relevant authorities shall ensure the confidentiality, integrity and protection of the information which they receive pursuant to Articles 4(2), 7(2) <...> and shall take steps to prevent any misuse of such information.

<...>

2. Subject to Article 17, the **national regulatory authorities** may decide to make publicly available parts of the information which it possesses, provided that commercially sensitive information on individual market participants or individual transactions or individual market places are not disclosed and cannot be inferred.

The **national regulatory authorities** shall make its commercially non-sensitive trade database available for scientific purposes, subject to confidentiality requirements.

Information shall be published or made available in the interest of improving transparency of wholesale energy markets and provided it is not likely to create any distortion in competition on those energy markets.

The **national regulatory authorities** shall disseminate information in a fair manner according to transparent rules which it shall draw up and make publicly available.

**Article 13**  
**Implementation of prohibitions against market abuse**

1. National regulatory authorities shall ensure that the prohibitions set out in Articles 3 and 5 and the obligation set out in Article 4 are applied.

Each **Contracting Party** shall ensure that its national regulatory authorities have the investigatory and enforcement powers necessary for the exercise of that function <...>. Those powers shall be exercised in a proportionate manner.

Those powers may be exercised:

(a) directly;

- (b) in collaboration with other authorities; or
- (c) by application to the competent judicial authorities.

Where appropriate, the national regulatory authorities may exercise their investigatory powers in collaboration with organised markets, trade-matching systems or other persons professionally arranging transactions <...>.

2. The investigatory and enforcement powers referred to in paragraph 1 shall be limited to the aim of the investigation. They shall be exercised in conformity with national law and include the right to:

- (a) have access to any relevant document in any form, and to receive a copy of it;
- (b) demand information from any relevant person, including those who are successively involved in the transmission of orders or conduct of the operations concerned, as well as their principals, and, if necessary, the right to summon and hear any such person or principal;
- (c) carry out on-site inspections;
- (d) require existing telephone and existing data traffic records;
- (e) require the cessation of any practice that is contrary to this Regulation or delegated acts or implementing acts adopted on the basis thereof;
- (f) request a court to freeze or sequester assets;
- (g) request a court or any competent authority to impose a temporary prohibition of professional activity.

#### **Article 14**

#### **Right of appeal**

**Contracting Parties** shall ensure that suitable mechanisms exist at national level under which a party affected by a decision of the regulatory authority has a right of appeal to a body independent of the parties involved and of any government.

#### **Article 15**

#### **Obligations of persons professionally arranging transactions**

Any person professionally arranging transactions in wholesale energy products who reasonably suspects that a transaction might breach Article 3 or 5 shall notify the national regulatory authority without further delay.

Persons professionally arranging transactions in wholesale energy products shall establish and maintain effective arrangements and procedures to identify breaches of Article 3 or 5.

#### **Article 16**

#### **Cooperation at **Energy Community** and national level**

1. The **Energy Community Regulatory Board** shall **facilitate** that national regulatory authorities carry

out their tasks under this Regulation in a coordinated and consistent way.

<...> National regulatory authorities shall cooperate <...> with each other, including at regional level **via the Energy Community Regulatory Board** for the purpose of carrying out their duties in accordance with this Regulation.

National regulatory authorities <...> and the national competition authority in a **Contracting Party** may establish appropriate forms of cooperation in order to ensure effective and efficient investigation and enforcement and to contribute to a coherent and consistent approach to investigation, judicial proceedings and to the enforcement of this Regulation and relevant financial and competition law.

2. National regulatory authorities shall without delay inform the **Energy Community Regulatory Board and the Secretariat** in as specific a manner as possible where they have reasonable grounds to suspect that acts in breach of this Regulation are being, or have been, carried out either in that **Contracting Party** or in another **Contracting Party**.

Where a national regulatory authority suspects that acts which affect wholesale energy markets or the price of wholesale energy products in that **Contracting Party** are being carried out in another **Contracting Party**, it may request the **Energy Community Regulatory Board and the Secretariat** to ensure that the requirements of this Regulation are implemented in such **Contracting Party** <...>.

3. In order to ensure a coordinated and consistent approach to market abuse on wholesale energy markets:

(a) <...>

(b) <...>

(c) <...>

national regulatory authorities shall inform the national competition authority of their **Contracting Party**, the **Secretariat** and the **Energy Community Regulatory Board** where they have reasonable grounds to suspect that acts are being, or have been, carried out on wholesale energy market which are likely to constitute a breach of competition law.

4. In order to carry out its functions under paragraph 1, where, *inter alia*, on the basis of initial assessments or analysis, the **Energy Community Regulatory Board** suspects that there has been a breach of this Regulation, it shall **be entitled**:

(a) to request one or more national regulatory authorities to supply any information related to the suspected breach;

(b) to request one or more national regulatory authorities to commence an investigation of the suspected breach, and to take appropriate action to remedy any breach found. Any decision as regards the appropriate action to be taken to remedy any breach found shall be the responsibility of the national regulatory authority concerned;

(c) where it considers that the possible breach has, or has had, a cross-border impact, to establish and coordinate an investigatory group consisting of representatives of concerned national regulatory authorities to investigate whether this Regulation has been breached and in which **Contracting Party** the breach took place. Where appropriate, the **Energy Community Regulatory Board** may also **seek** the participation of representatives of **the Agency** or other relevant authority of one or more **Contracting Party and/or** Member States in the investigatory group.

5. A national regulatory authority receiving a request for information under point (a) of paragraph 4, or

receiving a request to commence an investigation of a suspected breach under point (b) of paragraph 4, shall immediately take the necessary measures in order to comply with that request. If that national regulatory authority is not able to supply the required information immediately, it shall without further delay notify the **Energy Community Regulatory Board** of the reasons.

By way of derogation from the first subparagraph, a national regulatory authority may refuse to act on a request where:

- (a) compliance might adversely affect the sovereignty or security of the **Contracting Party** addressed;
- (b) judicial proceedings have already been initiated in respect of the same actions and against the same persons before the authorities of the **Contracting Party** addressed; or
- (c) a final judgment has already been delivered in relation to such persons for the same actions in the **Contracting Party** addressed.

In any such case, the national regulatory authority shall notify the **Energy Community Regulatory Board** accordingly, providing as detailed information as possible on those proceedings or the judgment.

National regulatory authorities shall participate in an investigatory group convened in accordance with point (c) of paragraph 4, rendering all necessary assistance. The investigatory group shall be subject to coordination by the **Energy Community Regulatory Board**.

6. <...>

## **Article 17**

### **Professional secrecy**

1. Any confidential information received, exchanged or transmitted pursuant to this Regulation shall be subject to the conditions of professional secrecy laid down in paragraphs 2, 3 and 4.

2. The obligation of professional secrecy shall apply to:

- (a) persons who work or who have worked for **an Energy Community institution**;
- (b) auditors and experts instructed by **an Energy Community institution**;
- (c) persons who work or who have worked for the national regulatory authorities or for other relevant authorities;
- (d) auditors and experts instructed by national regulatory authorities or by other relevant authorities who receive confidential information in accordance with this Regulation.

3. Confidential information received by the persons referred to in paragraph 2 in the course of their duties may not be divulged to any other person or authority, except in summary or aggregate form such that an individual market participant or market place cannot be identified, without prejudice to cases covered by criminal law, the other provisions of this Regulation or other relevant **Energy Community** legislation .

4. Without prejudice to cases covered by criminal law, the <...> national regulatory authorities, <...> bodies or persons which receive confidential information pursuant to this Regulation may use it only in the performance of their duties and for the exercise of their functions. Other authorities, bodies or persons may use that information for the purpose for which it was provided to them or in the context of administrative or judicial proceedings specifically related to the exercise of those functions. The au-

thority receiving the information may use it for other purposes, provided that the **Energy Community Regulatory Board**, national regulatory authorities, <...> bodies or persons communicating information consent thereto.

5. This Article shall not prevent an authority in a **Contracting Party** from exchanging or transmitting, in accordance with national law, confidential information provided that it has not been received from an authority of another **Contracting Party** or from the **Energy Community Regulatory Board or the Secretariat** under this Regulation.

### **Article 18**

#### **Penalties**

The **Contracting Parties** shall lay down the rules on penalties applicable to infringements of this Regulation and shall take all measures necessary to ensure that they are implemented. The penalties provided for must be effective, dissuasive and proportionate, reflecting the nature, duration and seriousness of the infringement, the damage caused to consumers and the potential gains from trading on the basis of inside information and market manipulation.

The **Contracting Parties** shall notify those provisions to the **Secretariat** by **the deadline for transposition of this Regulation in the Energy Community** at the latest and shall notify it without delay of any subsequent amendment affecting them.

**Contracting Parties** shall provide that the national regulatory authority may disclose to the public measures or penalties imposed for infringement of this Regulation unless such disclosure would cause disproportionate damage to the parties involved.

## **RULES of 21 June 2012 governing the adoption of guidelines and network codes in the Energy Community**

Procedural Act 2012/01/PHLG-EnC of 21 June 2012 laying down the rules governing the adoption of guidelines and network codes in the Energy Community.

### THE PERMANENT HIGH LEVEL GROUP OF THE ENERGY COMMUNITY

Having regard to the Treaty establishing the Energy Community (“the Treaty”), and in particular Articles 87 and 82 thereof,

Having regard to Articles 27 and 28 of Decision 2011/02/MC-EnC on the implementation of Directive 2009/72/EC, Directive 2009/73/EC, Regulation (EC) No 714/2009 and Regulation (EC) No 715/2009 and amending Articles 11 and 59 of the Energy Community Treaty (“Decision 2011/02/MC-EnC”), providing for the adoption of Guidelines and Network Codes by the Permanent High Level Group upon proposal from the European Commission based on Article 79 of the Treaty,

Following up on the task assigned to the Permanent High Level Group in Articles 27(3) and 28(3) of Decision 2011/02/MC-EnC to prepare a Procedural Act laying down the procedure for the incorporation of Guidelines and Network Codes adopted within the European Union,

Recognizing the importance of a synchronous evolution of the Energy Community *acquis communautaire* for the creation of an interconnected internal market throughout the Energy Community,

Acknowledging the necessity to transpose Guidelines and Network Codes into domestic legal orders as timely and truly to the original as possible, and to implement and enforce them vigorously,

Having regard to the Secretariat’s proposal,

Taking into account the discussions at the meetings of 14 December 2011, 23 March 2012 and 21 June 2012,

HAS ADOPTED THIS PROCEDURAL ACT:

### **Article 1**

#### **Subject-Matter**

These rules lay down the procedures for the adoption of Guidelines and Network Codes by Decision of the Permanent High Level Group of the Energy Community upon proposal of the European Commission, as required by Articles 27 and 28 of Decision 2011/02/MC-EnC.

### **Article 2**

#### **Definitions**

For the purpose of this Procedural Act

- The term “Guidelines” means Guidelines adopted and/or amended by the European Commission

under Directive 2009/72/EC, Directive 2009/73/EC, Regulation 714/2009, and Regulation 715/2009, - The term "Network Code" means the codes adopted and/or amended under Regulation 714/2009 or Regulation 715/2009.

### **Article 3**

#### **Procedure**

(1) The Presidency and the Vice-Presidencies shall include the European Commission's proposal on the adoption of Guidelines or Network Codes in the agenda of the next possible meeting of the Permanent High Level Group. The text of the proposal shall be circulated by the Secretariat to all members at least 30 days before the relevant meeting.

(2) If the next possible meeting of the Permanent High Level Group is to take place later than two months following the receipt of the above-mentioned proposal of the European Commission by the Secretariat, or later than three months, where it concerns the adoption of Network Codes, the Presidency, after consultation and in agreement with the Vice-Presidencies, may opt for decision-making by correspondence in line with the Rules of Procedure of the Permanent High Level Group.

(3) Where the European Commission's proposal concerns the adoption of Network Codes, the Secretariat shall forward it to the President of the Regulatory Board and request the opinion of this institution within an appropriate timeframe not exceeding 30 days. The President of the Regulatory Board shall transmit its opinion officially to the Secretariat, who shall notify it to the members of the Permanent High Level Group without delay. Where the Regulatory Board fails to submit an opinion within the specified timeframe, the Permanent High Level Group shall proceed without such opinion.

(4) The Permanent High Level Group shall take its Decisions under this Procedural Act in accordance with Articles 78 to 81 of the Treaty.

(5) Decisions of the Permanent High Level Group shall:

a. Specify the period within which the Contracting Parties shall transpose Guidelines and Network Codes, as adopted by the Permanent High Level Group's Decision, into their domestic legislation and require that the Guidelines and Network Codes be transposed without changes to their text or their structure of the Decision, other than translation.

b. Require the Contracting Parties to ensure that the Guidelines and Network Codes, as adopted by the Permanent High Level Group's Decision, are binding on market participants, and task the national regulatory authorities with monitoring and enforcing compliance.

c. Require the Contracting Parties to notify the Secretariat of the measures transposing the Permanent High Level Group's Decision, and of any subsequent changes made to those measures, within two weeks of the adoption of such measures.

(6) The Secretariat shall make Decisions available to all Parties within seven days of their adoption.

***Article 4***

**Addressees and entry into force**

This Procedural Act is addressed to the Parties and institutions of the Treaty. It shall enter into force upon adoption.

***Article 5***

**Availability of these rules**

The Secretariat shall make this Procedural Act available to all Parties within seven days of its adoption.

Done in Vienna on 21 June 2012.

---

## **PART II**

ACQUIS COMMUNAUTAIRE

GAS

## **DIRECTIVE 2009/73/EC of 13 July 2009 concerning common rules for the internal market in natural gas and repealing Directive 2003/55/EC**

Incorporated and adapted by Ministerial Council Decision 2011/02/MC-EnC of 6 October 2011 on the implementation of Directive 2009/72/EC, Directive 2009/73/EC, Regulation (EC) 714/2009 and Regulation (EC) 715/2009 and amending Articles 11 and 59 of the Energy Community Treaty.

*The adaptations made by Ministerial Council Decision 2011/02/MC-EnC are highlighted in **bold and blue**.*

Whereas:

(1) The internal market in natural gas, which has been progressively implemented throughout the Community since 1999, aims to deliver real choice for all consumers of the European Union, be they citizens or businesses, new business opportunities and more cross-border trade, so as to achieve efficiency gains, competitive prices, and higher standards of service, and to contribute to security of supply and sustainability.

(2) Directive 2003/55/EC of the European Parliament and of the Council of 26 June 2003 concerning common rules for the internal market in natural gas has made a significant contribution towards the creation of such an internal market in natural gas.

(3) The freedoms which the Treaty guarantees the citizens of the Union - *inter alia*, the free movement of goods, the freedom of establishment and the freedom to provide services - are achievable only in a fully open market, which enables all consumers freely to choose their suppliers and all suppliers freely to deliver to their customers.

(4) However, at present, there are obstacles to the sale of gas on equal terms and without discrimination or disadvantages in the Community. In particular, non-discriminatory network access and an equally effective level of regulatory supervision in each Member State do not yet exist.

(5) The Communication of the Commission of 10 January 2007 entitled "An Energy Policy for Europe" highlighted the importance of completing the internal market in natural gas and of creating a level playing field for all natural gas undertakings established in the Community. The Communications of the Commission of 10 January 2007 entitled "Prospects for the internal gas and electricity market" and "Inquiry pursuant to Article 17 of Regulation (EC) No 1/2003 into the European gas and electricity sectors (Final Report)" showed that the present rules and measures do not provide the necessary framework for achieving the objective of a well-functioning internal market.

(6) Without effective separation of networks from activities of production and supply (effective unbundling), there is a risk of discrimination not only in the operation of the network but also in the incentives for vertically integrated undertakings to invest adequately in their networks.

(7) The rules on legal and functional unbundling as provided for in Directive 2003/55/EC have not, however, led to effective unbundling of the transmission system operators. At its meeting on 8 and 9 March 2007, the European Council therefore invited the Commission to develop legislative proposals for the "effective separation of supply and production activities from network operations".

(8) Only the removal of the incentive for vertically integrated undertakings to discriminate against competitors as regards network access and investment can ensure effective unbundling. Ownership unbundling, which implies the appointment of the network owner as the system operator and its

independence from any supply and production interests, is clearly an effective and stable way to solve the inherent conflict of interests and to ensure security of supply. For that reason, the European Parliament, in its resolution of 10 July 2007 on prospects for the internal gas and electricity market referred to ownership unbundling at transmission level as the most effective tool by which to promote investments in infrastructure in a non-discriminatory way, fair access to the network for new entrants and transparency in the market. Under ownership unbundling, Member States should therefore be required to ensure that the same person or persons are not entitled to exercise control over a production or supply undertaking and, at the same time, exercise control or any right over a transmission system operator or transmission system. Conversely, control over a transmission system or transmission system operator should preclude the possibility of exercising control or any right over a production or supply undertaking. Within those limits, a production or supply undertaking should be able to have a minority shareholding in a transmission system operator or transmission system.

(9) Any system for unbundling should be effective in removing any conflict of interests between producers, suppliers and transmission system operators, in order to create incentives for the necessary investments and guarantee the access of new market entrants under a transparent and efficient regulatory regime and should not create an overly onerous regulatory regime for national regulatory authorities.

(10) The definition of the term “control” is taken from Council Regulation (EC) No 139/2004 of 20 January 2004 on the control of concentrations between undertakings (the EC Merger Regulation).

(11) Since ownership unbundling requires, in some instances, the restructuring of undertakings, Member States that decide to implement ownership unbundling should be granted additional time to apply the relevant provisions. In view of the vertical links between the electricity and gas sectors, the unbundling provisions should apply across the two sectors.

(12) Under ownership unbundling, to ensure full independence of network operation from supply and production interests and to prevent exchanges of any confidential information, the same person should not be a member of the managing boards of both a transmission system operator or a transmission system and an undertaking performing any of the functions of production or supply. For the same reason, the same person should not be entitled to appoint members of the managing boards of a transmission system operator or a transmission system and to exercise control or any right over a production or supply undertaking.

(13) The setting up of a system operator or a transmission operator that is independent from supply and production interests should enable a vertically integrated undertaking to maintain its ownership of network assets whilst ensuring an effective separation of interests, provided that such independent system operator or such independent transmission operator performs all the functions of a system operator and detailed regulation and extensive regulatory control mechanisms are put in place.

(14) Where, on 3 September 2009, an undertaking owning a transmission system is part of a vertically integrated undertaking, Member States should therefore be given a choice between ownership unbundling and setting up a system operator or transmission operator which is independent from supply and production interests.

(15) To preserve fully the interests of the shareholders of vertically integrated undertakings, Member States should have the choice of implementing ownership unbundling either by direct divestiture or by splitting the shares of the integrated undertaking into shares of the network undertaking and shares of the remaining supply and production undertaking, provided that the requirements result-

ing from ownership unbundling are complied with.

(16) The full effectiveness of the independent system operator or independent transmission operator solutions should be ensured by way of specific additional rules. The rules on the independent transmission operator provide an appropriate regulatory framework to guarantee fair competition, sufficient investment, access for new market entrants and the integration of gas markets. Effective unbundling through the independent transmission operator provisions should be based on a pillar of organisational measures and measures relating to the governance of transmission system operators and on a pillar of measures relating to investment, connecting new production capacities to the network and market integration through regional cooperation. The independence of the transmission operator should also, *inter alia*, be ensured through certain “cooling-off” periods during which no management or other relevant activity giving access to the same information as could have been obtained in a managerial position is exercised in the vertically integrated undertaking. The independent transmission operator model of effective unbundling is in line with the requirements laid down by the European Council at its meeting on 8 and 9 March 2007.

(17) In order to develop competition in the internal market in gas, large non-household customers should be able to choose their suppliers and enter into contracts with several suppliers to secure their gas requirements. Such customers should be protected against exclusivity clauses, the effect of which is to exclude competing or complementary offers.

(18) A Member State has the right to opt for full ownership unbundling in its territory. Where a Member State has exercised that right, an undertaking does not have the right to set up an independent system operator or an independent transmission operator. Furthermore, an undertaking performing any of the functions of production or supply cannot directly or indirectly exercise control or any right over a transmission system operator from a Member State that has opted for full ownership unbundling.

(19) Under this Directive different types of market organisation will exist in the internal market in natural gas. The measures that Member States could take in order to ensure a level playing field should be based on overriding requirements of general interest. The Commission should be consulted on the compatibility of the measures with the Treaty and Community law.

(20) The implementation of effective unbundling should respect the principle of non-discrimination between the public and private sectors. To that end, the same person should not be able to exercise control or any right, in violation of the rules of ownership unbundling or the independent system operator option, solely or jointly, over the composition, voting or decision of the bodies of both the transmission system operators or the transmission systems and the production or supply undertakings. With regard to ownership unbundling and the independent system operator solution, provided that the Member State in question is able to demonstrate that the requirement is complied with, two separate public bodies should be able to control production and supply activities on the one hand and transmission activities on the other.

(21) Fully effective separation of network activities from supply and production activities should apply throughout the Community to both Community and non-Community undertakings. To ensure that network activities and supply and production activities throughout the Community remain independent from each other, regulatory authorities should be empowered to refuse certification to transmission system operators that do not comply with the unbundling rules. To ensure the consistent application of those rules across the Community, the regulatory authorities should take utmost

account of the Commission's opinion when the former take decisions on certification. To ensure, in addition, respect for the international obligations of the Community and solidarity and energy security within the Community, the Commission should have the right to give an opinion on certification in relation to a transmission system owner or a transmission system operator which is controlled by a person or persons from a third country or third countries.

(22) The security of energy supply is an essential element of public security and is therefore inherently connected to the efficient functioning of the internal market in gas and the integration of the isolated gas markets of Member States. Gas can reach the citizens of the Union only through the network. Functioning open gas markets and, in particular, the networks and other assets associated with gas supply are essential for public security, for the competitiveness of the economy and for the well-being of the citizens of the Union. Persons from third countries should therefore only be allowed to control a transmission system or a transmission system operator if they comply with the requirements of effective separation that apply inside the Community. Without prejudice to the international obligations of the Community, the Community considers that the gas transmission system sector is of high importance to the Community and therefore additional safeguards are necessary regarding the preservation of the security of supply of energy to the Community to avoid any threats to public order and public security in the Community and the welfare of the citizens of the Union. The security of supply of energy to the Community requires, in particular, an assessment of the independence of network operation, the level of the Community's and individual Member States' dependence on energy supply from third countries, and the treatment of both domestic and foreign trade and investment in energy in a particular third country. Security of supply should therefore be assessed in the light of the factual circumstances of each case as well as the rights and obligations arising under international law, in particular the international agreements between the Community and the third country concerned. Where appropriate the Commission is encouraged to submit recommendations to negotiate relevant agreements with third countries addressing the security of supply of energy to the Community or to include the necessary issues in other negotiations with those third countries.

(23) Further measures should be taken in order to ensure transparent and non-discriminatory tariffs for access to transport. Those tariffs should be applicable to all users on a non-discriminatory basis. Where a storage facility, linepack or ancillary service operates in a sufficiently competitive market, access could be allowed on the basis of transparent and non-discriminatory market-based mechanisms.

(24) It is necessary to ensure the independence of storage system operators in order to improve third-party access to storage facilities that are technically and/or economically necessary for providing efficient access to the system for the supply of customers. It is therefore appropriate that storage facilities are operated through legally separate entities that have effective decision-making rights with respect to assets necessary to maintain, operate and develop storage facilities. It is also necessary to increase transparency in respect of the storage capacity that is offered to third parties, by obliging Member States to define and publish a non-discriminatory, clear framework that determines the appropriate regulatory regime applicable to storage facilities. That obligation should not require a new decision on access regimes but should improve the transparency regarding the access regime to storage. Confidentiality requirements for commercially sensitive information are particularly important where data of a strategic nature are concerned or where there is only a single user of a storage facility.

(25) Non-discriminatory access to the distribution network determines downstream access to customers at retail level. The scope for discrimination as regards third party access and investment,

however, is less significant at distribution level than at transmission level where congestion and the influence of production interests are generally greater than at distribution level. Moreover, legal and functional unbundling of distribution system operators was required, pursuant to Directive 2003/55/EC, only from 1 July 2007 and its effects on the internal market in natural gas still need to be evaluated. The rules on legal and functional unbundling currently in place can lead to effective unbundling provided they are more clearly defined, properly implemented and closely monitored. To create a level playing field at retail level, the activities of distribution system operators should therefore be monitored so that they are prevented from taking advantage of their vertical integration as regards their competitive position on the market, in particular in relation to household and small non-household customers.

(26) Member States should take concrete measures to assist the wider use of biogas and gas from biomass, the producers of which should be granted non-discriminatory access to the gas system, provided that such access is compatible with the relevant technical rules and safety standards on an ongoing basis.

(27) To avoid imposing a disproportionate financial and administrative burden on small distribution system operators, Member States should be able, where necessary, to exempt the undertakings concerned from the legal distribution unbundling requirements.

(28) Where a closed distribution system is used to ensure the optimal efficiency of an integrated energy supply requiring specific operational standards, or a closed distribution system is maintained primarily for the use of the owner of the system, it should be possible to exempt the distribution system operator from obligations which would constitute an unnecessary administrative burden because of the particular nature of the relationship between the distribution system operator and the users of the system. Industrial, commercial or shared services sites such as train station buildings, airports, hospitals, large camping sites with integrated facilities or chemical industry sites can include closed distribution systems because of the specialised nature of their operations.

(29) Directive 2003/55/EC introduced a requirement for Member States to establish regulators with specific competences. However, experience shows that the effectiveness of regulation is frequently hampered through a lack of independence of regulators from government, and insufficient powers and discretion. For that reason, at its meeting on 8 and 9 March 2007, the European Council invited the Commission to develop legislative proposals providing for further harmonisation of the powers and strengthening of the independence of national energy regulators. It should be possible for those national regulatory authorities to cover both the electricity and the gas sectors.

(30) Energy regulators need to be able to take decisions in relation to all relevant regulatory issues if the internal market in natural gas is to function properly, and to be fully independent from any other public or private interests. This precludes neither judicial review nor parliamentary supervision in accordance with the constitutional law of the Member States. In addition, approval of the budget of the regulator by the national legislator does not constitute an obstacle to budgetary autonomy. The provisions relating to autonomy in the implementation of the allocated budget of the regulatory authority should be implemented within the framework defined by national budgetary law and rules. While contributing to the independence of the national regulatory authority from any political or economic interest through an appropriate rotation scheme, it should be possible for Member States to take due account of the availability of human resources and of the size of the board.

(31) In order to ensure effective market access for all market players, including new entrants,

non-discriminatory and cost-reflective balancing mechanisms are necessary. This should be achieved through the setting up of transparent market-based mechanisms for the supply and purchase of gas, needed in the framework of balancing requirements. National regulatory authorities should play an active role to ensure that balancing tariffs are non-discriminatory and cost-reflective. At the same time, appropriate incentives should be provided to balance the in-put and off-take of gas and not to endanger the system.

(32) National regulatory authorities should be able to fix or approve tariffs, or the methodologies underlying the calculation of the tariffs, on the basis of a proposal by the transmission system operator or distribution system operator(s) or liquefied natural gas (LNG) system operator, or on the basis of a proposal agreed between those operator(s) and the users of the network. In carrying out those tasks, national regulatory authorities should ensure that transmission and distribution tariffs are non-discriminatory and cost-reflective, and should take account of the long-term, marginal, avoided network costs from demand-side management measures.

(33) Energy regulators should have the power to issue binding decisions in relation to natural gas undertakings and to impose effective, proportionate and dissuasive penalties on natural gas undertakings which fail to comply with their obligations or to propose that a competent court impose such penalties on them. Energy regulators should also be granted the power to decide, irrespective of the application of competition rules, on appropriate measures ensuring customer benefits through the promotion of effective competition necessary for the proper functioning of the internal market in natural gas. The establishment of gas-release programmes is one of the possible measures that can be used to promote effective competition and ensure the proper functioning of the market. Energy regulators should also be granted the powers to contribute to ensuring high standards of public service in compliance with market opening, to the protection of vulnerable customers, and to the full effectiveness of consumer protection measures. Those provisions should be without prejudice to both the Commission's powers concerning the application of competition rules including the examination of mergers with a Community dimension, and the rules on the internal market such as the free movement of capital. The independent body to which a party affected by the decision of a national regulator has a right to appeal could be a court or other tribunal empowered to conduct a judicial review.

(34) Any harmonisation of the powers of national regulatory authorities should include the powers to provide incentives to natural gas undertakings and to impose effective, proportionate and dissuasive penalties on natural gas undertakings or to propose that a competent court impose such penalties. Moreover, regulatory authorities should have the power to request relevant information from natural gas undertakings, make appropriate and sufficient investigations and settle disputes.

(35) Investments in major new infrastructure should be strongly promoted while ensuring the proper functioning of the internal market in natural gas. In order to enhance the positive effect of exempted infrastructure projects on competition and security of supply, market interest during the project planning phase should be tested and congestion management rules should be implemented. Where an infrastructure is located in the territory of more than one Member State, the Agency for the Cooperation of Energy Regulators established by Regulation (EC) No 713/2009 of the European Parliament and of the Council of 13 July 2009 establishing an Agency for the Cooperation of Energy Regulators (the "Agency") should handle as a last resort the exemption request in order to take better account of its cross-border implications and to facilitate its administrative handling. Moreover, given the exceptional risk profile of constructing those exempt major infrastructure projects, it should

be possible temporarily to grant partial derogations to undertakings with supply and production interests in respect of the unbundling rules for the projects concerned. The possibility of temporary derogations should apply, for security of supply reasons, in particular, to new pipelines within the Community transporting gas from third countries into the Community. Exemptions granted under Directive 2003/55/EC continue to apply until the scheduled expiry date as decided in the granted exemption decision.

(36) The internal market in natural gas suffers from a lack of liquidity and transparency hindering the efficient allocation of resources, risk hedging and new entry. Trust in the market, its liquidity and the number of market participants needs to increase, and, therefore, regulatory oversight of undertakings active in the supply of gas needs to be increased. Such requirements should be without prejudice to, and compatible with, existing Community law in relation to the financial markets. Energy regulators and financial market regulators need to cooperate in order to enable each other to have an overview of the markets concerned.

(37) Natural gas is mainly, and increasingly, imported into the Community from third countries. Community law should take account of the characteristics of natural gas, such as certain structural rigidities arising from the concentration of suppliers, the long-term contracts or the lack of downstream liquidity. Therefore, more transparency is needed, including in regard to the formation of prices.

(38) Prior to the adoption by the Commission of Guidelines defining further the record-keeping requirements, the Agency and the Committee of European Securities Regulators (the "CESR"), established by Commission Decision 2009/77/EC, should confer and advise the Commission in regard to their content. The Agency and the CESR should also cooperate to investigate further and advise on whether transactions in gas supply contracts and gas derivatives should be subject to pre- and/or post-trade transparency requirements and, if so, what the content of those requirements should be.

(39) Member States or, where a Member State has so provided, the regulatory authority, should encourage the development of interruptible supply contracts.

(40) In the interests of security of supply, the balance between supply and demand in individual Member States should be monitored, and such monitoring should be followed by a report on the situation at Community level, taking account of interconnection capacity between areas. Such monitoring should be carried out sufficiently early to enable appropriate measures to be taken if security of supply is compromised. The construction and maintenance of the necessary network infrastructure, including interconnection capacity, should contribute to ensuring a stable gas supply.

(41) Member States should ensure that, taking into account the necessary quality requirements, biogas and gas from biomass or other types of gas are granted non-discriminatory access to the gas system, provided such access is permanently compatible with the relevant technical rules and safety standards. Those rules and standards should ensure that those gases can technically and safely be injected into, and transported through the natural gas system and should also address their chemical characteristics.

(42) Long-term contracts will continue to be an important part of the gas supply of Member States and should be maintained as an option for gas supply undertakings in so far as they do not undermine the objective of this Directive and are compatible with the Treaty, including the competition rules. It is therefore necessary to take into account long-term contracts in the planning of supply and transport capacity of natural gas undertakings.

(43) In order to ensure the maintenance of high standards of public service in the Community, all measures taken by Member States to achieve the objectives of this Directive should be regularly notified to the Commission. The Commission should regularly publish a report analysing measures taken at national level to achieve public service objectives and comparing their effectiveness, with a view to making recommendations as regards measures to be taken at national level to achieve high public service standards. Member States should ensure that when they are connected to the gas system customers are informed about their rights to be supplied with natural gas of a specified quality at reasonable prices. Measures taken by Member States to protect final customers may differ according to whether they are aimed at household customers or small and medium-sized enterprises.

(44) Respect for the public service requirements is a fundamental requirement of this Directive, and it is important that common minimum standards, respected by all Member States, are specified in this Directive, which take into account the objectives of common protection, security of supply, environmental protection and equivalent levels of competition in all Member States. It is important that the public service requirements can be interpreted on a national basis, taking into account national circumstances and subject to the respect of Community law.

(45) It should be possible for measures implemented by Member States to achieve the objectives of social and economic cohesion to include, in particular, the provision of adequate economic incentives, using, where appropriate, all existing national and Community tools. It should be possible for such tools to include liability mechanisms to guarantee the necessary investment.

(46) To the extent to which measures taken by Member States to fulfil public service obligations constitute State aid under Article 87(1) of the Treaty, there is an obligation under Article 88(3) of the Treaty to notify them to the Commission.

(47) The public service requirements and the common minimum standards that follow from them need to be further strengthened to make sure that all consumers, especially vulnerable ones, can benefit from competition and fair prices. The public service requirements should be defined at national level, taking into account national circumstances; Community law should, however, be respected by the Member States. The citizens of the Union and, where Member States deem it to be appropriate, small enterprises, should be able to enjoy public service obligations, in particular with regard to security of supply and reasonable tariffs. A key aspect in supplying customers is access to objective and transparent consumption data. Thus, consumers should have access to their consumption data and associated prices and services costs so that they can invite competitors to make an offer based on those data. Consumers should also have the right to be properly informed about their energy consumption. Prepayments should reflect the likely consumption of natural gas and different payment systems should be non-discriminatory. Information on energy costs provided to consumers frequently enough will create incentives for energy savings because it will give customers direct feedback on the effects of investment in energy efficiency and change of behaviour.

(48) Consumer interests should be at the heart of this Directive and quality of service should be a central responsibility of natural gas undertakings. Existing rights of consumers need to be strengthened and guaranteed, and should include greater transparency. Consumer protection should ensure that all consumers in the wider remit of the Community benefit from a competitive market. Consumer rights should be enforced by Member States or, where a Member State has so provided, the regulatory authorities.

(49) Clear and comprehensible information should be made available to consumers concerning their

rights in relation to the energy sector. The Commission should establish, after consulting relevant stakeholders including Member States, national regulatory authorities, consumer organisations and natural gas undertakings, an accessible, user-friendly energy consumer checklist providing consumers with practical information about their rights. That energy consumer checklist should be provided to all consumers and should be made publicly available.

(50) Energy poverty is a growing problem in the Community. Member States which are affected and which have not yet done so should, therefore, develop national action plans or other appropriate frameworks to tackle energy poverty, aiming at decreasing the number of people suffering such situation. In any event, Member States should ensure the necessary energy supply for vulnerable customers. In doing so, an integrated approach, such as in the framework of social policy, could be used and measures could include social policies or energy efficiency improvements for housing. At the very least, this Directive should allow national policies in favour of vulnerable customers.

(51) Greater consumer protection is guaranteed by the availability of effective means of dispute settlement for all consumers. Member States should introduce speedy and effective complaint handling procedures.

(52) It should be possible to base the introduction of intelligent metering systems on an economic assessment. Should that assessment conclude that the introduction of such metering systems is economically reasonable and cost-effective only for consumers with a certain amount of gas consumption, Member States should be able to take this into account when implementing intelligent metering systems.

(53) Market prices should give the right incentives for the development of the network.

(54) Promoting fair competition and easy access for different suppliers should be of the utmost importance for Member States in order to allow consumers to take full advantage of the opportunities of a liberalised internal market in natural gas.

(55) In order to contribute to security of supply whilst maintaining a spirit of solidarity between Member States, notably in the event of an energy supply crisis, it is important to provide a framework for regional cooperation in a spirit of solidarity. Such cooperation may rely, if Member States so decide, first and foremost on market-based mechanisms. Cooperation for the promotion of regional and bilateral solidarity should not impose a disproportionate burden on or discriminate between market participants.

(56) With a view to creating an internal market in natural gas, Member States should foster the integration of their national markets and the cooperation of system operators at Community and regional level, also incorporating the isolated systems forming gas islands that persist in the Community.

(57) The development of a true internal market in natural gas, through a network connected across the Community, should be one of the main goals of this Directive and regulatory issues on cross border interconnections and regional markets should, therefore, be one of the main tasks of the regulatory authorities, in close cooperation with the Agency where relevant.

(58) Securing common rules for a true internal market and a broad supply of gas should also be one of the main goals of this Directive. To that end, undistorted market prices would provide an incentive for cross-border interconnections while leading, in the long term, to price convergence.

(59) The regulatory authorities should also provide information on the market to permit the Commission to exercise its role of observing and monitoring the internal market in natural gas and its short,

medium and long-term evolution, including aspects such as supply and demand, transmission and distribution infrastructure, quality of service, cross-border trade, congestion management, investments, wholesale and consumer prices, market liquidity and environmental and efficiency improvements. National regulatory authorities should report to the competition authorities and the Commission those Member States in which prices impair competition and proper functioning of the market.

(60) Since the objective of this Directive, namely the creation of a fully operational internal market in natural gas, cannot be sufficiently achieved by the Member States and can therefore be better achieved at Community level, the Community may adopt measures, in accordance with the principle of subsidiarity as set out in Article 5 of the Treaty. In accordance with the principle of proportionality, as set out in that Article, this Directive does not go beyond what is necessary in order to achieve that objective.

(61) Under Regulation (EC) No 715/2009 of the European Parliament and of the Council of 13 July 2009 on conditions for access to the natural gas transmission networks, the Commission may adopt Guidelines to achieve the necessary degree of harmonisation. Such Guidelines, which constitute binding implementing measures, are, also with regard to certain provisions of this Directive, a useful tool which can be adapted quickly where necessary.

(62) The measures necessary for the implementation of this Directive should be adopted in accordance with Council Decision 1999/468/EC of 28 June 1999 laying down the procedures for the exercise of implementing powers conferred on the Commission.

(63) In particular, the Commission should be empowered to adopt the Guidelines necessary for providing the minimum degree of harmonisation required to achieve the aim of this Directive. Since those measures are of general scope and are designed to amend non-essential elements of this Directive, by supplementing it with new non-essential elements, they must be adopted in accordance with the regulatory procedure with scrutiny provided for in Article 5a of Decision 1999/468/EC.

(64) In accordance with point 34 of the Interinstitutional Agreement on better law-making, Member States are encouraged to draw up, for themselves and in the interest of the Community, their own tables, illustrating, as far as possible, the correlation between this Directive and the transposition measures, and to make them public.

(65) Given the scope of the amendments made to Directive 2003/55/EC herein, it is desirable, for reasons of clarity and rationalisation, that the provisions in question should be recast by bringing them all together in a single text in a new Directive.

(66) This Directive respects the fundamental rights, and observes the principles, recognised in particular by the Charter of Fundamental Rights of the European Union.

## CHAPTER I

### SUBJECT MATTER, SCOPE AND DEFINITIONS

#### *Article 1*

##### **Subject matter and scope**

1. This Directive establishes common rules for the transmission, distribution, supply and storage of natural gas. It lays down the rules relating to the organisation and functioning of the natural gas sector, access to the market, the criteria and procedures applicable to the granting of authorisations for transmission, distribution, supply and storage of natural gas and the operation of systems.

2. The rules established by this Directive for natural gas, including LNG, shall also apply in a non-discriminatory way to biogas and gas from biomass or other types of gas in so far as such gases can technically and safely be injected into, and transported through, the natural gas system.

#### *Article 2*

##### **Definitions**

For the purposes of this Directive, the following definitions apply:

(1) “natural gas undertaking” means a natural or legal person carrying out at least one of the following functions: production, transmission, distribution, supply, purchase or storage of natural gas, including LNG, which is responsible for the commercial, technical and/or maintenance tasks related to those functions, but shall not include final customers;

(2) “upstream pipeline network” means any pipeline or network of pipelines operated and/or constructed as part of an oil or gas production project, or used to convey natural gas from one or more such projects to a processing plant or terminal or final coastal landing terminal;

(3) “transmission” means the transport of natural gas through a network, which mainly contains high-pressure pipelines, other than an upstream pipeline network and other than the part of high-pressure pipelines primarily used in the context of local distribution of natural gas, with a view to its delivery to customers, but not including supply;

(4) “transmission system operator” means a natural or legal person who carries out the function of transmission and is responsible for operating, ensuring the maintenance of, and, if necessary, developing the transmission system in a given area and, where applicable, its interconnections with other systems, and for ensuring the long-term ability of the system to meet reasonable demands for the transport of gas;

(5) “distribution” means the transport of natural gas through local or regional pipeline networks with a view to its delivery to customers, but not including supply;

(6) “distribution system operator” means a natural or legal person who carries out the function of distribution and is responsible for operating, ensuring the maintenance of, and, if necessary, developing the distribution system in a given area and, where applicable, its interconnections with other systems, and for ensuring the long-term ability of the system to meet reasonable demands for the

distribution of gas;

(7) “supply” means the sale, including resale, of natural gas, including LNG, to customers;

(8) “supply undertaking” means any natural or legal person who carries out the function of supply;

(9) “storage facility” means a facility used for the stocking of natural gas and owned and/or operated by a natural gas undertaking, including the part of LNG facilities used for storage but excluding the portion used for production operations, and excluding facilities reserved exclusively for transmission system operators in carrying out their functions;

(10) “storage system operator” means a natural or legal person who carries out the function of storage and is responsible for operating a storage facility;

(11) “LNG facility” means a terminal which is used for the liquefaction of natural gas or the importation, offloading, and re-gasification of LNG, and includes ancillary services and temporary storage necessary for the re-gasification process and subsequent delivery to the transmission system, but does not include any part of LNG terminals used for storage;

(12) “LNG system operator” means a natural or legal person who carries out the function of liquefaction of natural gas, or the importation, offloading, and re-gasification of LNG and is responsible for operating a LNG facility;

(13) “system” means any transmission networks, distribution networks, LNG facilities and/or storage facilities owned and/or operated by a natural gas undertaking, including linepack and its facilities supplying ancillary services and those of related undertakings necessary for providing access to transmission, distribution and LNG;

(14) “ancillary services” means all services necessary for access to and the operation of transmission networks, distribution networks, LNG facilities, and/or storage facilities, including load balancing, blending and injection of inert gases, but not including facilities reserved exclusively for transmission system operators carrying out their functions;

(15) “linepack” means the storage of gas by compression in gas transmission and distribution systems, but not including facilities reserved for transmission system operators carrying out their functions;

(16) “interconnected system” means a number of systems which are linked with each other;

(17) “interconnector” means a transmission line which crosses or spans a border between **Contracting Parties** for the sole purpose of connecting the national transmission systems of those **Contracting Parties**;

(18) “direct line” means a natural gas pipeline complementary to the interconnected system;

(19) “integrated natural gas undertaking” means a vertically or horizontally integrated undertaking;

(20) “vertically integrated undertaking” means a natural gas undertaking or a group of natural gas undertakings where the same person or the same persons are entitled, directly or indirectly, to exercise control, and where the undertaking or group of undertakings perform at least one of the functions of transmission, distribution, LNG or storage, and at least one of the functions of production or supply of natural gas;

(21) “horizontally integrated undertaking” means an undertaking performing at least one of the functions of production, transmission, distribution, supply or storage of natural gas, and a non-gas activity;

- (22) “related undertaking” means an affiliated undertaking, within the meaning of Article 41 of Seventh Council Directive 83/349/EEC of 13 June 1983 based on the Article 44(2)(g) of the Treaty on consolidated accounts and/or an associated undertaking, within the meaning of Article 33(1) of that Directive, and/or an undertaking which belong to the same shareholders;
- (23) “system user” means a natural or legal person supplying to, or being supplied by, the system;
- (24) “customer” means a wholesale or final customer of natural gas or a natural gas undertaking which purchases natural gas;
- (25) “household customer” means a customer purchasing natural gas for his own household consumption;
- (26) “non-household customer” means a customer purchasing natural gas which is not for his own household use;
- (27) “final customer” means a customer purchasing natural gas for his own use;
- (28) “eligible customer” means a customer who is free to purchase gas from the supplier of his choice, within the meaning of Article 37;
- (29) “wholesale customer” means a natural or legal person other than a transmission system operator or distribution system operator who purchases natural gas for the purpose of resale inside or outside the system where he is established;
- (30) “long-term planning” means the planning of supply and transport capacity of natural gas undertakings on a long-term basis with a view to meeting the demand for natural gas of the system, diversification of sources and securing supplies to customers;
- (31) “emergent market” means a **Contracting Party** in which the first commercial supply of its first long-term natural gas supply contract was made not more than 10 years earlier;
- (32) “security” means both security of supply of natural gas and technical safety;
- (33) “new infrastructure” means an infrastructure not completed by **1 July 2007**;
- (34) “gas supply contract” means a contract for the supply of natural gas, but does not include a gas derivative;
- (35) “gas derivative” means a financial instrument specified in points 5, 6 or 7 of Section C of Annex I to Directive 2004/39/EC of the European Parliament and of the Council of 21 April 2004 on markets in financial instruments, where that instrument relates to natural gas;
- (36) “control” means any rights, contracts or any other means which, either separately or in combination and having regard to the considerations of fact or law involved, confer the possibility of exercising decisive influence on an undertaking, in particular by:
- (a) ownership or the right to use all or part of the assets of an undertaking;
  - (b) rights or contracts which confer decisive influence on the composition, voting or decisions of the organs of an undertaking.

## CHAPTER II

## GENERAL RULES FOR THE ORGANISATION OF THE SECTOR

*Article 3***Public service obligations and customer protection**

1. **Contracting Parties** shall ensure, on the basis of their institutional organisation and with due regard to the principle of subsidiarity, that, without prejudice to paragraph 2, natural gas undertakings are operated in accordance with the principles of this Directive with a view to achieving a competitive, secure and environmentally sustainable market in natural gas, and shall not discriminate between those undertakings as regards their rights or obligations.
2. Having full regard to the relevant provisions of the **Energy Community Treaty, in particular Article 19 thereof, Contracting Parties** may impose on undertakings operating in the gas sector, in the general economic interest, public service obligations which may relate to security, including security of supply, regularity, quality and price of supplies, and environmental protection, including energy efficiency, energy from renewable sources and climate protection. Such obligations shall be clearly defined, transparent, non-discriminatory, verifiable and shall guarantee equality of access for natural gas undertakings of the **Energy Community** to national consumers. In relation to security of supply, energy efficiency/demand-side management and for the fulfilment of environmental goals and goals for energy from renewable sources, as referred to in this paragraph, **Contracting Parties** may introduce the implementation of long-term planning, taking into account the possibility of third parties seeking access to the system.
3. **Contracting Parties** shall take appropriate measures to protect final customers, and shall, in particular, ensure that there are adequate safeguards to protect vulnerable customers. In this context, each **Contracting Party** shall define the concept of vulnerable customers which may refer to energy poverty and, *inter alia*, to the prohibition of disconnection of gas to such customers in critical times. **Contracting Parties** shall ensure that rights and obligations linked to vulnerable customers are applied. In particular, they shall take appropriate measures to protect final customers in remote areas who are connected to the gas system. **Contracting Parties** may appoint a supplier of last resort for customers connected to the gas system. They shall ensure high levels of consumer protection, particularly with respect to transparency regarding contractual terms and conditions, general information and dispute settlement mechanisms. **Contracting Parties** shall ensure that the eligible customer is in fact able easily to switch to a new supplier. As regards at least household customers those measures shall include those set out in Annex I.
4. **Contracting Parties** shall take appropriate measures, such as formulating national energy action plans, providing social security benefits to ensure the necessary gas supply to vulnerable customers, or providing for support for energy efficiency improvements, to address energy poverty where identified, including in the broader context of poverty. Such measures shall not impede the effective opening of the market set out in Article 37 and market functioning and shall be notified to the **Energy Community Secretariat**, where relevant, in accordance with paragraph 11 of this Article. Such notification shall not include measures taken within the general social security system.
5. **Contracting Parties** shall ensure that all customers connected to the gas network are entitled

to have their gas provided by a supplier, subject to the supplier's agreement, regardless of the **Contracting Party** in which the supplier is registered, as long as the supplier follows the applicable trading and balancing rules and subject to security of supply requirements. In this regard, **Contracting Parties** shall take all measures necessary to ensure that administrative procedures do not constitute a barrier for supply undertakings already registered in another **Contracting Party**.

6. **Contracting Parties** shall ensure that:

(a) where a customer, while respecting the contractual conditions, wishes to change supplier, the change is effected by the operator(s) concerned within three weeks; and

(b) customers are entitled to receive all relevant consumption data.

**Contracting Parties** shall ensure that the rights referred to in points (a) and (b) of the first subparagraph are granted to customers in a non-discriminatory manner as regards cost, effort or time.

7. **Contracting Parties** shall implement appropriate measures to achieve the objectives of social and economic cohesion and environmental protection, which may include means to combat climate change, and security of supply. Such measures may include, in particular, the provision of adequate economic incentives, using, where appropriate, all existing national tools, as well as financing from the international donors, for the maintenance and construction of necessary network infrastructure, including interconnection capacity.

8. In order to promote energy efficiency, **Contracting Parties** or, where a **Contracting Party** has so provided, the regulatory authority shall strongly recommend that natural gas undertakings optimise the use of gas, for example by providing energy management services, developing innovative pricing formulas or introducing intelligent metering systems or smart grids where appropriate

9. **Contracting Parties** shall ensure the provision of single points of contact to provide consumers with all necessary information concerning their rights, current legislation and the means of dispute settlement available to them in the event of a dispute. Such contact points may be part of general consumer information points.

**Contracting Parties** shall ensure that an independent mechanism such as an energy ombudsman or a consumer body is in place in order to ensure efficient treatment of complaints and out-of-court dispute settlements.

10. **Contracting Parties** may decide not to apply the provisions of Article 4 with respect to distribution insofar as their application would obstruct, in law or in fact, the performance of the obligations imposed on natural gas undertakings in the general economic interest and insofar as the development of trade would not be affected to such an extent as would be contrary to the interests of the **Energy Community**. The interests of the **Energy Community** include, *inter alia*, competition with regard to eligible customers in accordance with this Directive **and Annex III of the Energy Community Treaty**.

11. **Contracting Parties** shall, upon implementation of this Directive, inform the **Energy Community Secretariat** of all measures adopted to fulfill public service obligations, including consumer and environmental protection, and their possible effect on national and international competition, whether or not such measures require a derogation from the provisions of this Directive. They shall notify the **Energy Community Secretariat** subsequently every two years of any changes to such measures, whether or not they require a derogation from this Directive.

12.<sup>1</sup> **1. Contracting Parties shall ensure that <...> gas suppliers or distribution system operators, in cooperation with the regulatory authority, take the necessary steps to provide their consumers with a copy of the energy consumer checklists established by the European Commission <...>.**

**2. The checklists shall be adopted by the Permanent High Level Group, following the procedure laid down in Article 79 of the Treaty.**

#### **Article 4**

##### **Authorisation procedure**

1. In circumstances where an authorisation (for example, licence, permission, concession, consent or approval) is required for the construction or operation of natural gas facilities, the **Contracting Parties** or any competent authority they designate shall grant authorisations to build and/or operate such facilities, pipelines and associated equipment on their territory, in accordance with paragraphs 2 to 4. **Contracting Parties** or any competent authority they designate may also grant authorisations on the same basis for the supply of natural gas and for wholesale customers.

2. Where **Contracting Parties** have a system of authorisation, they shall lay down objective and non-discriminatory criteria which shall be met by an undertaking applying for an authorisation to build and/or operate natural gas facilities or applying for an authorisation to supply natural gas. The non-discriminatory criteria and procedures for the granting of authorisations shall be made public. **Contracting Parties** shall ensure that authorisation procedures for facilities, pipelines and associated equipment take into account the importance of the project for the internal market in natural gas where appropriate.

3. **Contracting Parties** shall ensure that the reasons for any refusal to grant an authorisation are objective and non-discriminatory and that they are given to the applicant. Reasons for such refusals shall be notified to the **Energy Community Secretariat** for information. Contracting Parties shall establish a procedure enabling the applicant to appeal against such refusals.

4. For the development of newly supplied areas and efficient operation generally, and without prejudice to Article 38, **Contracting Parties** may decline to grant a further authorisation to build and operate distribution pipeline systems in any particular area once such pipeline systems have been or are proposed to be built in that area and if existing or proposed capacity is not saturated.

#### **Article 5**

##### **Monitoring of security of supply**

**Contracting Parties** shall ensure the monitoring of security of supply issues. Where **Contracting Parties** consider it appropriate, they may delegate that task to the regulatory authorities referred to in Article 39(1). Such monitoring shall, in particular, cover the balance of supply and demand on the national market, the level of expected future demand and available supplies, envisaged additional capacity being planned or under construction, and the quality and level of maintenance of the net-

<sup>1</sup> Replaced by Article 6 of Decision 2011/02/MC-EnC.

works, as well as measures to cover peak demand and to deal with shortfalls of one or more suppliers. The competent authorities shall publish, by 31 July each year, a report outlining the findings resulting from the monitoring of those issues, as well as any measures taken or envisaged to address them and shall forward that report to the **Energy Community Secretariat** forthwith.

### **Article 6**

#### **Regional solidarity**

1. In order to safeguard a secure supply on the internal market in natural gas, **Contracting Parties** shall cooperate in order to promote regional and bilateral solidarity.
2. Such cooperation shall cover situations resulting or likely to result in the short term in a severe disruption of supply affecting a **Contracting Party**. It shall include:
  - (a) coordination of national emergency measures referred to in Article 8 of Council Directive 2004/67/EC of 26 April 2004 concerning measures to safeguard security of natural gas supply, **as adapted under Article 24 of the Energy Community Treaty**;
  - (b) identification and, where necessary, development or upgrading of electricity and natural gas interconnections; and
  - (c) conditions and practical modalities for mutual assistance.
3. The **Energy Community Secretariat** and the other **Contracting Parties** shall be kept informed of such cooperation.
4. <...>

### **Article 7**

#### **Promotion of regional cooperation<sup>2</sup>**

1. **Contracting Parties** as well as the regulatory authorities shall cooperate with each other for the purpose of integrating their national markets at regional level, as a first step towards the creation of a fully liberalised internal market. In particular, the regulatory authorities where **Contracting Parties** have so provided or **Contracting Parties** shall promote and facilitate the cooperation of transmission system operators at a regional level, including on cross-border issues with the aim of creating a competitive internal market in natural gas, foster the consistency of their legal, regulatory and technical framework and facilitate integration of the isolated systems forming gas islands that persist in the **Energy Community**. <...>
2. The **Energy Community Regulatory Board** shall cooperate with national regulatory authorities and transmission system operators to ensure the compatibility of regulatory frameworks with other European regions with the aim of creating a competitive internal market in natural gas. <...>
3. **Contracting Parties** shall ensure, through the implementation of this Directive, that transmission

<sup>2</sup> In addition, Article 25 of Decision 2011/02/MC-EnC reads: *'Transmission system operators shall promote operational arrangements in order to ensure the optimum management of the Energy Community network and shall promote the development of energy exchanges, the coordinated allocation of cross-border capacity through non-discriminatory market-based solutions, paying due attention to the specific merits of implicit auctions for short-term allocations, and the integration of balancing and reserve power mechanisms.'*

system operators have one or more integrated system(s) at regional level covering two or more **Contracting Parties** for capacity allocation and for checking the security of the network.

4. Where vertically integrated transmission system operators participate in a joint undertaking established for implementing such cooperation, the joint undertaking shall establish and implement a compliance programme which sets out the measures to be taken to ensure that discriminatory and anticompetitive conduct is excluded. That compliance programme shall set out the specific obligations of employees to meet the objective of excluding discriminatory and anticompetitive conduct. It shall be notified to the **Energy Community Regulatory Board**. Compliance with the programme shall be independently monitored by the compliance officers of the vertically integrated transmission system operators.

### **Article 8**

#### **Technical rules**

The regulatory authorities where **Contracting Parties** have so provided or **Contracting Parties** shall ensure that technical safety criteria are defined and that technical rules establishing the minimum technical design and operational requirements for the connection to the system of LNG facilities, storage facilities, other transmission or distribution systems, and direct lines, are developed and made public. Those technical rules shall ensure the interoperability of systems and shall be objective and non-discriminatory. <...>

## **CHAPTER III**

### **TRANSMISSION, STORAGE AND LNG**

#### **Article 9**

#### **Unbundling of transmission systems and transmission system operators**

1. **Contracting Parties** shall ensure that from **1 June 2016**<sup>3</sup>:

- (a) each undertaking which owns a transmission system acts as a transmission system operator;
- (b) the same person or persons are entitled neither:
  - (i) directly or indirectly to exercise control over an undertaking performing any of the functions of production or supply, and directly or indirectly to exercise control or exercise any right over a transmission system operator or over a transmission system; nor
  - (ii) directly or indirectly to exercise control over a transmission system operator or over a transmission system, and directly or indirectly to exercise control or exercise any right over an undertaking performing any of the functions of production or supply;
- (c) the same person or persons are not entitled to appoint members of the supervisory board, the administrative board or bodies legally representing the undertaking, of a transmission system oper-

<sup>3</sup> According to Ministerial Council Decision 2012/05/MC-EnC of 5 December 2012, this date is replaced by 1 January 2020 for the Republic of Moldova.

ator or a transmission system, and directly or indirectly to exercise control or exercise any right over an undertaking performing any of the functions of production or supply; and

(d) the same person is not entitled to be a member of the supervisory board, the administrative board or bodies legally representing the undertaking, of both an undertaking performing any of the functions of production or supply and a transmission system operator or a transmission system.

2. The rights referred to in points (b) and (c) of paragraph 1 shall include, in particular:

(a) the power to exercise voting rights;

(b) the power to appoint members of the supervisory board, the administrative board or bodies legally representing the undertaking; or

(c) the holding of a majority share.

3. For the purpose of paragraph 1(b), the notion “undertaking performing any of the functions of production or supply” shall include “undertaking performing any of the functions of generation and supply” within the meaning of Directive 2009/72/EC of the European Parliament and of the Council of 13 July 2009 concerning common rules for the internal market in electricity, **as adapted under Article 24 of the Energy Community Treaty**, and the terms “transmission system operator” and “transmission system” shall include “transmission system operator” and “transmission system” within the meaning of that Directive.

4. **Contracting Parties** may allow for derogations from points (b) and (c) of paragraph 1 until **1 June 2017**, provided that transmission system operators are not part of a vertically integrated undertaking.

5. The obligation set out in paragraph 1(a) of this Article shall be deemed to be fulfilled in a situation where two or more undertakings which own transmission systems have created a joint venture which acts as a transmission system operator in two or more **Contracting Parties** for the transmission systems concerned. No other undertaking may be part of the joint venture, unless it has been approved under Article 14 as an independent system operator or as an independent transmission operator for the purposes of Chapter IV.

6. For the implementation of this Article, where the person referred to in points (b), (c) and (d) of paragraph 1 is the Contracting Party or another public body, two separate public bodies exercising control over a transmission system operator or over a transmission system on the one hand, and over an undertaking performing any of the functions of production or supply on the other, shall be deemed not to be the same person or persons.

7. **Contracting Parties** shall ensure that neither commercially sensitive information referred to in Article 16 held by a transmission system operator which was part of a vertically integrated undertaking, nor the staff of such a transmission system operator, is transferred to undertakings performing any of the functions of production and supply.

8. Where on **6 October 2011**, the transmission system belongs to a vertically integrated undertaking a **Contracting Party** may decide not to apply paragraph 1.

In such case, the **Contracting Party** concerned shall either:

(a) designate an independent system operator in accordance with Article 14, or

(b) comply with the provisions of Chapter IV.

9. Where on **6 October 2011**, the transmission system belongs to a vertically integrated undertaking

and there are arrangements in place which guarantee more effective independence of the transmission system operator than the provisions of Chapter IV, a **Contracting** Party may decide not to apply paragraph 1.

10. Before an undertaking is approved and designated as a transmission system operator under paragraph 9 of this Article, it shall be certified according to the procedures laid down in Article 10(4), (5) and (6) of this Directive and in Article 3 of Regulation (EC) No 715/2009, **as adapted under Article 24 of the Energy Community Treaty**, pursuant to which the **Energy Community Secretariat** shall verify that the arrangements in place clearly guarantee more effective independence of the transmission system operator than the provisions of Chapter IV.

11. Vertically integrated undertakings which own a transmission system shall not in any event be prevented from taking steps to comply with paragraph 1.

12. Undertakings performing any of the functions of production or supply shall not in any event be able to directly or indirectly take control over or exercise any right over unbundled transmission system operators in **Contracting Parties** which apply paragraph 1.

### *Article 10*

#### **Designation and certification of transmission system operators**

1. Before an undertaking is approved and designated as transmission system operator, it shall be certified according to the procedures laid down in paragraphs 4, 5 and 6 of this Article and in Article 3 of Regulation (EC) No 715/2009, **as adapted under Article 24 of the Energy Community Treaty**.

2. Undertakings which own a transmission system and which have been certified by the national regulatory authority as having complied with the requirements of Article 9, pursuant to the certification procedure, shall be approved and designated as transmission system operators by **Contracting Parties**. The designation of transmission system operators shall be notified to the **Energy Community Secretariat** and published in **a dedicated section of the website of the Energy Community**.

3. Transmission system operators shall notify to the regulatory authority any planned transaction which may require a reassessment of their compliance with the requirements of Article 9.

4. The regulatory authorities shall monitor the continuing compliance of transmission system operators with the requirements of Article 9. They shall open a certification procedure to ensure such compliance:

- (a) upon notification by the transmission system operator pursuant to paragraph 3;
- (b) on their own initiative where they have knowledge that a planned change in rights or influence over transmission system owners or transmission system operators may lead to an infringement of Article 9, or where they have reason to believe that such an infringement may have occurred; or
- (c) upon a reasoned request from the **Energy Community Secretariat**.

5. The regulatory authorities shall adopt a decision on the certification of a transmission system operator within a period of four months from the date of the notification by the transmission system operator or from the date of the **Energy Community Secretariat** request. After expiry of that period, the certification shall be deemed to be granted. The explicit or tacit decision of the regulatory authority shall become effective only after the conclusion of the procedure set out in paragraph 6.

6. The explicit or tacit decision on the certification of a transmission system operator shall be notified without delay to the **Energy Community Secretariat** by the regulatory authority, together with all the relevant information with respect to that decision. The **Energy Community Secretariat** shall act in accordance with the procedure laid down in Article 3 of Regulation (EC) No 715/2009, **as adapted under Article 24 of the Energy Community Treaty**.

7. The regulatory authorities and the **Energy Community Secretariat** may request from transmission system operators and undertakings performing any of the functions of production or supply any information relevant for the fulfillment of their tasks under this Article.

8. The regulatory authorities and the **Energy Community Secretariat** shall preserve the confidentiality of commercially sensitive information.

### Article 11

#### Certification in relation to third countries

1. Where certification is requested by a transmission system owner or a transmission system operator which is controlled by a person or persons from a third country or third countries, the regulatory authority shall notify the **Energy Community Secretariat**.

The regulatory authority shall also notify to the **Energy Community Secretariat** without delay any circumstances that would result in a person or persons from a third country or third countries acquiring control of a transmission system or a transmission system operator.

2. The transmission system operator shall notify to the regulatory authority any circumstances that would result in a person or persons from a third country or third countries acquiring control of the transmission system or the transmission system operator.

3. The regulatory authority shall adopt a draft decision on the certification of a transmission system operator within four months from the date of notification by the transmission system operator. It shall refuse the certification if it has not been demonstrated:

(a) that the entity concerned complies with the requirements of Article 9; and

(b) to the regulatory authority or to another competent authority designated by the **Contracting Party** that granting certification will not put at risk the security of energy supply of the **Contracting Party** and the **Energy Community**. In considering that question the regulatory authority or other competent authority so designated shall take into account:

(i) the rights and obligations of the **Energy Community** with respect to that third country arising under international law, including any agreement concluded with one or more third countries to which the **Energy Community** is a party and which addresses the issues of security of energy supply

(ii) the rights and obligations of the **Contracting Party** with respect to that third country arising under agreements concluded with it, insofar as they are in compliance with **Energy Community law**; and

(iii) other specific facts and circumstances of the case and the third country concerned.<sup>4</sup>

<sup>4</sup> According to Article 10(1) of Decision 2011/02/MC-EnC, 'the regulatory authority or other competent authority designated shall also take into account the rights and obligations resulting from association or trade agreements between the Contracting Party and the European Union'.

4. The regulatory authority shall notify the decision to the **Energy Community Secretariat** without delay, together with all the relevant information with respect to that decision.

5. **Contracting Parties** shall provide for the regulatory authority or the designated competent authority referred to in paragraph 3(b), before the regulatory authority adopts a decision on the certification, to request an opinion from the **Energy Community Secretariat** on whether:

(a) the entity concerned complies with the requirements of Article 9; and

(b) granting certification will not put at risk the security of energy supply to the **Energy Community**.

6. The **Energy Community Secretariat** shall examine the request referred to in paragraph 5 as soon as it is received. Within a period of two months after receiving the request, it shall deliver its opinion to the national regulatory authority or, if the request was made by the designated competent authority, to that authority.

**In preparing its opinion, the Secretariat shall request the views of the Energy Community Regulatory Board.** It may also request the views of the **Contracting Party** concerned and interested parties. In the event that the **Energy Community Secretariat** makes such a request, the two-month period shall be extended by two months.

In the absence of an opinion by the **Energy Community Secretariat** within the period referred to in the first and second subparagraphs, the **Energy Community Secretariat** is deemed not to raise objections to the decision of the regulatory authority.

7. When assessing whether the control by a person or persons from a third country or third countries will put at risk the security of energy supply to the **Energy Community**, the **Energy Community Secretariat** shall take into account:

(a) the specific facts of the case and the third country or third countries concerned; and

(b) the rights and obligations of the **Energy Community** with respect to that third country arising under international law, including any agreement concluded with one or more third countries to which the **Energy Community** is a party and which addresses the issues of security of energy supply.<sup>5</sup>

8. The national regulatory authority shall, within a period of two months after the expiry of the period referred to in paragraph 6, adopt its final decision on the certification. In adopting its final decision the national regulatory authority shall take utmost account of the the **Energy Community Secretariat's** opinion. In any event **Contracting Parties** shall have the right to refuse certification where granting certification puts at risk the **Contracting Party's** security of energy supply or the security of energy supply of another **Contracting Party**. Where the **Contracting Party** has designated another competent authority to assess paragraph 3(b), it may require the national regulatory authority to adopt its final decision in accordance with the assessment of that competent authority. The regulatory authority's final decision and the opinion of the **Energy Community Secretariat** shall be published together. Where the final decision diverges from the **Energy Community Secretariat's** opinion, the **Contracting Party** concerned shall provide and publish, together with that decision, the reasoning underlying such decision.

9. Nothing in this Article shall affect the right of **Contracting Parties** to exercise, in compliance with **Energy Community** law, national legal controls to protect legitimate public security interests.

<sup>5</sup> According to Article 10(2) of Decision 2011/02/MC-EnC, Article 10(1) of the same Decision applies - 'the regulatory authority or other competent authority designated shall also take into account the rights and obligations resulting from association or trade agreements between the Contracting Party and the European Union'.

10. <...>

11. <...>

### **Article 12**

#### **Designation of storage and LNG system operators**

**Contracting Parties** shall designate, or shall require natural gas undertakings which own storage or LNG facilities to designate, for a period of time to be determined by **Contracting Parties**, having regard to considerations of efficiency and economic balance, one or more storage and LNG system operators.

### **Article 13**

#### **Tasks of transmission, storage and/or LNG system operators**

1. Each transmission, storage and/or LNG system operator shall:

(a) operate, maintain and develop under economic conditions secure, reliable and efficient transmission, storage and/or LNG facilities to secure an open market, with due regard to the environment, ensure adequate means to meet service obligations;

(b) refrain from discriminating between system users or classes of system users, particularly in favour of its related undertakings;

(c) provide any other transmission system operator, any other storage system operator, any other LNG system operator and/or any distribution system operator, sufficient information to ensure that the transport and storage of natural gas may take place in a manner compatible with the secure and efficient operation of the interconnected system; and

(d) provide system users with the information they need for efficient access to the system.

2. Each transmission system operator shall build sufficient cross-border capacity to integrate European transmission infrastructure accommodating all economically reasonable and technically feasible demands for capacity and taking into account security of gas supply.

3. Rules adopted by transmission system operators for balancing the gas transmission system shall be objective, transparent and non-discriminatory, including rules for the charging of system users of their networks for energy imbalance. Terms and conditions, including rules and tariffs, for the provision of such services by transmission system operators shall be established pursuant to a methodology compatible with Article 41(6) in a non-discriminatory and cost-reflective way and shall be published.

4. The regulatory authorities where **Contracting Parties** have so provided or **Contracting Parties** may require transmission system operators to comply with minimum standards for the maintenance and development of the transmission system, including interconnection capacity.

5. Transmission system operators shall procure the energy they use for the carrying out of their functions according to transparent, non-discriminatory and market based procedures.

## Article 14

### Independent system operators

1. Where the transmission system belongs to a vertically integrated undertaking on **6 October 2011**, **Contracting Parties** may decide not to apply Article 9(1) and designate an independent system operator upon a proposal from the transmission system owner. Such designation shall be subject to **the opinion of the Energy Community Secretariat**.

2. The **Contracting Party** may approve and designate an independent system operator only where:

(a) the candidate operator has demonstrated that it complies with the requirements of Article 9(1) (b), (c) and (d);

(b) the candidate operator has demonstrated that it has at its disposal the required financial, technical, physical and human resources to carry out its tasks under Article 13;

(c) the candidate operator has undertaken to comply with a ten-year network development plan monitored by the regulatory authority;

(d) the transmission system owner has demonstrated its ability to comply with its obligations under paragraph 5. To that end, it shall provide all the draft contractual arrangements with the candidate undertaking and any other relevant entity; and

(e) the candidate operator has demonstrated its ability to comply with its obligations under Regulation (EC) No 715/2009, **as adapted under Article 24 of the Energy Community Treaty**, including the cooperation of transmission system operators at regional level.

3. Undertakings which have been certified by the regulatory authority as having complied with the requirements of Article 11 and of paragraph 2 of this Article shall be approved and designated as independent system operators by Contracting Parties. The certification procedure in either Article 10 of this Directive and Article 3 of Regulation (EC) No 715/2009, **as adapted under Article 24 of the Energy Community Treaty**, or in Article 11 of this Directive shall be applicable.

4. Each independent system operator shall be responsible for granting and managing third-party access, including the collection of access charges and congestion charges, for operating, maintaining and developing the transmission system, as well as for ensuring the long-term ability of the system to meet reasonable demand through investment planning. When developing the transmission system the independent system operator shall be responsible for planning (including authorisation procedure), construction and commissioning of the new infrastructure. For this purpose, the independent system operator shall act as a transmission system operator in accordance with this Chapter. The transmission system owner shall not be responsible for granting and managing third-party access, nor for investment planning.

5. Where an independent system operator has been designated, the transmission system owner shall:

(a) provide all the relevant cooperation and support to the independent system operator for the fulfillment of its tasks, including in particular all relevant information;

(b) finance the investments decided by the independent system operator and approved by the regulatory authority, or give its agreement to financing by any interested party including the independent system operator. The relevant financing arrangements shall be subject to approval by the regulatory authority. Prior to such approval, the regulatory authority shall consult the transmission system own-

er together with other interested parties;

(c) provide for the coverage of liability relating to the network assets, excluding the liability relating to the tasks of the independent system operator; and

(d) provide guarantees to facilitate financing any network expansions with the exception of those investments where, pursuant to point (b), it has given its agreement to financing by any interested party including the independent system operator.

6. In close cooperation with the regulatory authority, the relevant national competition authority shall be granted all relevant powers to effectively monitor compliance of the transmission system owner with its obligations under paragraph 5.

### **Article 15**

#### **Unbundling of transmission system owners and storage system operators**

1. A transmission system owner, where an independent system operator has been appointed, and a storage system operator which are part of vertically integrated undertakings shall be independent at least in terms of their legal form, organisation and decision making from other activities not relating to transmission, distribution and storage.

This Article shall apply only to storage facilities that are technically and/or economically necessary for providing efficient access to the system for the supply of customers pursuant to Article 33.

2. In order to ensure the independence of the transmission system owner and storage system operator referred to in paragraph 1, the following minimum criteria shall apply:

(a) persons responsible for the management of the transmission system owner and storage system operator shall not participate in company structures of the integrated natural gas undertaking responsible, directly or indirectly, for the day-to-day operation of the production and supply of natural gas;

(b) appropriate measures shall be taken to ensure that the professional interests of persons responsible for the management of the transmission system owner and storage system operator are taken into account in a manner that ensures that they are capable of acting independently;

(c) the storage system operator shall have effective decision-making rights, independent from the integrated natural gas undertaking, with respect to assets necessary to operate, maintain or develop the storage facilities. This shall not preclude the existence of appropriate coordination mechanisms to ensure that the economic and management supervision rights of the parent company in respect of return on assets regulated indirectly in accordance with Article 41(6) in a subsidiary are protected. In particular, this shall enable the parent company to approve the annual financial plan, or any equivalent instrument, of the storage system operator and to set global limits on the levels of indebtedness of its subsidiary. It shall not permit the parent company to give instructions regarding day-to-day operations, nor with respect to individual decisions concerning the construction or upgrading of storage facilities, that do not exceed the terms of the approved financial plan, or any equivalent instrument; and

(d) the transmission system owner and the storage system operator shall establish a compliance programme, which sets out measures taken to ensure that discriminatory conduct is excluded, and ensure that observance of it is adequately monitored. The compliance programme shall set out the

specific obligations of employees to meet those objectives. An annual report, setting out the measures taken, shall be submitted by the person or body responsible for monitoring the compliance programme to the regulatory authority and shall be published.

3. <...>

### **Article 16**

#### **Confidentiality for transmission system operators and transmission system owners**

1. Without prejudice to Article 30 or any other legal duty to disclose information, each transmission, storage and/or LNG system operator, and each transmission system owner, shall preserve the confidentiality of commercially sensitive information obtained in the course of carrying out its activities, and shall prevent information about its own activities which may be commercially advantageous from being disclosed in a discriminatory manner. In particular, it shall not disclose any commercially sensitive information to the remaining parts of the undertaking, unless this is necessary for carrying out a business transaction. In order to ensure the full respect of the rules on information unbundling, **Contracting Parties** shall ensure that the transmission system owner including, in the case of a combined operator, the distribution system operator, and the remaining part of the undertaking do not use joint services, such as joint legal services, apart from purely administrative or IT functions.

2. Transmission, storage and/or LNG system operators shall not, in the context of sales or purchases of natural gas by related undertakings, misuse commercially sensitive information obtained from third parties in the context of providing or negotiating access to the system.

3. Information necessary for effective competition and the efficient functioning of the market shall be made public. That obligation shall be without prejudice to protecting commercially sensitive information.

## **CHAPTER IV**

### **INDEPENDENT TRANSMISSION OPERATOR**

#### **Article 17**

##### **Assets, equipment, staff and identity**

1. Transmission system operators shall be equipped with all human, technical, physical and financial resources necessary for fulfilling their obligations under this Directive and carrying out the activity of gas transmission, in particular:

(a) assets that are necessary for the activity of gas transmission, including the transmission system, shall be owned by the transmission system operator;

(b) personnel necessary for the activity of gas transmission, including the performance of all corporate tasks, shall be employed by the transmission system operator;

(c) leasing of personnel and rendering of services, to and from any other parts of the vertically integrated undertaking shall be prohibited. A transmission system operator may, however, render

services to the vertically integrated undertaking as long as:

(i) the provision of those services does not discriminate between system users, is available to all system users on the same terms and conditions and does not restrict, distort or prevent competition in production or supply; and

(ii) the terms and conditions of the provision of those services are approved by the regulatory authority;

(d) without prejudice to the decisions of the Supervisory Body under Article 20, appropriate financial resources for future investment projects and/or for the replacement of existing assets shall be made available to the transmission system operator in due time by the vertically integrated undertaking following an appropriate request from the transmission system operator.

2. The activity of gas transmission shall include at least the following tasks in addition to those listed in Article 13:

(a) the representation of the transmission system operator and contacts to third parties and the regulatory authorities;

(b) <...>

(c) granting and managing third-party access on a non-discriminatory basis between system users or classes of system users;

(d) the collection of all the transmission system related charges including access charges, balancing charges for ancillary services such as gas treatment, purchasing of services (balancing costs, energy for losses);

(e) the operation, maintenance and development of a secure, efficient and economic transmission system;

(f) investment planning ensuring the long-term ability of the system to meet reasonable demand and guaranteeing security of supply;

(g) the setting up of appropriate joint ventures, including with one or more transmission system operators, gas exchanges, and the other relevant actors pursuing the objective to develop the creation of regional markets or to facilitate the liberalisation process; and

(h) all corporate services, including legal services, accountancy and IT services.

3. Transmission system operators shall be organised in a legal form as referred to in Article 1 of Council Directive 68/151/EEC.

4. The transmission system operator shall not, in its corporate identity, communication, branding and premises, create confusion in respect of the separate identity of the vertically integrated undertaking or any part thereof.

5. The transmission system operator shall not share IT systems or equipment, physical premises and security access systems with any part of the vertically integrated undertaking, nor use the same consultants or external contractors for IT systems or equipment, and security access systems.

6. The accounts of transmission system operators shall be audited by an auditor other than the one auditing the vertically integrated undertaking or any part thereof.

## Article 18

### Independence of the transmission system operator

1. Without prejudice to the decisions of the Supervisory Body under Article 20, the transmission system operator shall have:

- (a) effective decision-making rights, independent from the vertically integrated undertaking, with respect to assets necessary to operate, maintain or develop the transmission system; and
- (b) the power to raise money on the capital market in particular through borrowing and capital increase.

2. The transmission system operator shall at all times act so as to ensure it has the resources it needs in order to carry out the activity of transmission properly and efficiently and develop and maintain an efficient, secure and economic transmission system.

3. Subsidiaries of the vertically integrated undertaking performing functions of production or supply shall not have any direct or indirect shareholding in the transmission system operator. The transmission system operator shall neither have any direct or indirect shareholding in any subsidiary of the vertically integrated undertaking performing functions of production or supply, nor receive dividends or any other financial benefit from that subsidiary.

4. The overall management structure and the corporate statutes of the transmission system operator shall ensure effective independence of the transmission system operator in compliance with this Chapter. The vertically integrated undertaking shall not determine, directly or indirectly, the competitive behaviour of the transmission system operator in relation to the day to day activities of the transmission system operator and management of the network, or in relation to activities necessary for the preparation of the ten-year network development plan developed pursuant to Article 22.

5. In fulfilling their tasks in Article 13 and Article 17(2) of this Directive, and in complying with Article 13(1), Article 14(1)(a), Article 16(2), (3) and (5), Article 18(6) and Article 21(1) of Regulation (EC) No 715/2009, **as adapted under Article 24 of the Energy Community Treaty**, transmission system operators shall not discriminate against different persons or entities and shall not restrict, distort or prevent competition in production or supply.

6. Any commercial and financial relations between the vertically integrated undertaking and the transmission system operator, including loans from the transmission system operator to the vertically integrated undertaking shall comply with market conditions. The transmission system operator shall keep detailed records of such commercial and financial relations and make them available to the regulatory authority upon request.

7. The transmission system operator shall submit for approval by the regulatory authority all commercial and financial agreements with the vertically integrated undertaking.

8. The transmission system operator shall inform the regulatory authority of the financial resources, referred to in Article 17(1)(d), available for future investment projects and/or for the replacement of existing assets.

9. The vertically integrated undertaking shall refrain from any action impeding or prejudicing the transmission system operator from complying with its obligations in this Chapter and shall not require the transmission system operator to seek permission from the vertically integrated undertaking in fulfilling those obligations.

10. An undertaking which has been certified by the regulatory authority as being in compliance with the requirements of this Chapter shall be approved and designated as a transmission system operator by the **Contracting Party** concerned. The certification procedure in either Article 10 of this Directive and Article 3 of Regulation (EC) No 715/2009, **as adapted under Article 24 of the Energy Community Treaty**, or in Article 11 of this Directive shall apply.

### **Article 19**

#### **Independence of the staff and the management of the transmission system operator**

1. Decisions regarding the appointment and renewal, working conditions including remuneration, and termination of the term of office, of the persons responsible for the management and/or members of the administrative bodies of the transmission system operator shall be taken by the Supervisory Body of the transmission system operator appointed in accordance with Article 20.

2. The identity of, and the conditions governing the term, the duration and the termination of office of, the persons nominated by the Supervisory Body for appointment or renewal as persons responsible for the executive management and/or as members of the administrative bodies of the transmission system operator, and the reasons for any proposed decision terminating such term of office, shall be notified to the regulatory authority. Those conditions and the decisions referred to in paragraph 1 shall become binding only if the regulatory authority has raised no objections within three weeks of notification.

The regulatory authority may object to the decisions referred to in paragraph 1 where:

(a) doubts arise as to the professional independence of a nominated person responsible for the management and/or member of the administrative bodies; or

(b) in the case of premature termination of a term of office, doubts exist regarding the justification of such premature termination.

3. No professional position or responsibility, interest or business relationship, directly or indirectly, with the vertically integrated undertaking or any part of it or its controlling shareholders other than the transmission system operator shall be exercised for a period of three years before the appointment of the persons responsible for the management and/or members of the administrative bodies of the transmission system operator who are subject to this paragraph.

4. The persons responsible for the management and/or members of the administrative bodies, and employees of the transmission system operator shall have no other professional position or responsibility, interest or business relationship, directly or indirectly, with any other part of the vertically integrated undertaking or with its controlling shareholders.

5. The persons responsible for the management and/or members of the administrative bodies, and employees of the transmission system operator shall hold no interest in or receive any financial benefit, directly or indirectly, from any part of the vertically integrated undertaking other than the transmission system operator. Their remuneration shall not depend on activities or results of the vertically integrated undertaking other than those of the transmission system operator

6. Effective rights of appeal to the regulatory authority shall be guaranteed for any complaints by the persons responsible for the management and/or members of the administrative bodies of the transmission system operator against premature terminations of their term of office.

7. After termination of their term of office in the transmission system operator, the persons responsible for its management and/or members of its administrative bodies shall have no professional position or responsibility, interest or business relationship with any part of the vertically integrated undertaking other than the transmission system operator, or with its controlling shareholders for a period of not less than four years.

8. Paragraph 3 shall apply to the majority of the persons responsible for the management and/or members of the administrative bodies of the transmission system operator.

The persons responsible for the management and/or members of the administrative bodies of the transmission system operator who are not subject to paragraph 3 shall have exercised no management or other relevant activity in the vertically integrated undertaking for a period of at least six months before their appointment.

The first subparagraph of this paragraph and paragraphs 4 to 7 shall be applicable to all the persons belonging to the executive management and to those directly reporting to them on matters related to the operation, maintenance or development of the network.

## **Article 20**

### **Supervisory Body**

1. The transmission system operator shall have a Supervisory Body which shall be in charge of taking decisions which may have a significant impact on the value of the assets of the shareholders within the transmission system operator, in particular decisions regarding the approval of the annual and longer-term financial plans, the level of indebtedness of the transmission system operator and the amount of dividends distributed to shareholders. The decisions falling under the remit of the Supervisory Body shall exclude those that are related to the day to day activities of the transmission system operator and management of the network, and in relation to activities necessary for the preparation of the ten-year network development plan developed pursuant to Article 22.

2. The Supervisory Body shall be composed of members representing the vertically integrated undertaking, members representing third party shareholders and, where the relevant legislation of a **Contracting Party** so provides, members representing other interested parties such as employees of the transmission system operator.

3. The first subparagraph of Article 19(2) and Article 19(3) to (7) shall apply to at least half of the members of the Supervisory Body minus one.

Point (b) of the second subparagraph of Article 19(2) shall apply to all the members of the Supervisory Body.

## **Article 21**

### **Compliance programme and compliance officer**

1. **Contracting Parties** shall ensure that transmission system operators establish and implement a compliance programme which sets out the measures taken in order to ensure that discriminatory conduct is excluded, and ensure that the compliance with that programme is adequately monitored.

The compliance programme shall set out the specific obligations of employees to meet those objectives. It shall be subject to approval by the regulatory authority. Without prejudice to the powers of the national regulator, compliance with the program shall be independently monitored by a compliance officer.

2. The compliance officer shall be appointed by the Supervisory Body, subject to the approval by the regulatory authority. The regulatory authority may refuse the approval of the compliance officer only for reasons of lack of independence or professional capacity. The compliance officer may be a natural or legal person. Article 19(2) to (8) shall apply to the compliance officer.

3. The compliance officer shall be in charge of:

(a) monitoring the implementation of the compliance programme;

(b) elaborating an annual report, setting out the measures taken in order to implement the compliance programme and

submitting it to the regulatory authority;

(c) reporting to the Supervisory Body and issuing recommendations on the compliance programme and its implementation;

(d) notifying the regulatory authority on any substantial breaches with regard to the implementation of the compliance programme; and

(e) reporting to the regulatory authority on any commercial and financial relations between the vertically integrated undertaking and the transmission system operator.

4. The compliance officer shall submit the proposed decisions on the investment plan or on individual investments in the network to the regulatory authority. This shall occur at the latest when the management and/or the competent administrative body of the transmission system operator submits them to the Supervisory Body.

5. Where the vertically integrated undertaking, in the general assembly or through the vote of the members of the Supervisory Body it has appointed, has prevented the adoption of a decision with the effect of preventing or delaying investments, which under the ten-year network development plan, was to be executed in the following three years, the compliance officer shall report this to the regulatory authority, which then shall act in accordance with Article 22.

6. The conditions governing the mandate or the employment conditions of the compliance officer, including the duration of his mandate, shall be subject to approval by the regulatory authority. Those conditions shall ensure the independence of the compliance officer, including by providing it with all the resources necessary for fulfilling his duties. During his mandate, the compliance officer shall have no other professional position, responsibility or interest, directly or indirectly, in or with any part of the vertically integrated undertaking or with its controlling shareholders.

7. The compliance officer shall report regularly, either orally or in writing, to the regulatory authority and shall have the right to report regularly, either orally or in writing, to the Supervisory Body of the transmission system operator.

8. The compliance officer may attend all meetings of the management or administrative bodies of the transmission system operator, and those of the Supervisory Body and the general assembly. The compliance officer shall attend all meetings that address the following matters:

(a) conditions for access to the network, as defined in Regulation (EC) No 715/2009, **as adapted under Article 24 of the Energy Community Treaty**, in particular regarding tariffs, third party

access services, capacity allocation and congestion management, transparency, balancing and secondary markets;

(b) projects undertaken in order to operate, maintain and develop the transmission system, including investments in new transport connections, in expansion of capacity and in optimisation of existing capacity;

(c) energy purchases or sales necessary for the operation of the transmission system.

9. The compliance officer shall monitor the compliance of the transmission system operator with Article 16.

10. The compliance officer shall have access to all relevant data and to the offices of the transmission system operator and to all the information necessary for the fulfillment of his task.

11. After prior approval by the regulatory authority, the Supervisory Body may dismiss the compliance officer. It shall dismiss the compliance officer for reasons of lack of independence or professional capacity upon request of the regulatory authority.

12. The compliance officer shall have access to the offices of the transmission system operator without prior announcement.

## **Article 22**

### **Network development and powers to make investment decisions**

1. Every year, transmission system operators shall submit to the regulatory authority a ten-year network development plan based on existing and forecast supply and demand after having consulted all the relevant stakeholders. That network development plan shall contain efficient measures in order to guarantee the adequacy of the system and the security of supply.

2. The ten-year network development plan shall, in particular:

(a) indicate to market participants the main transmission infrastructure that needs to be built or upgraded over the next ten years;

(b) contain all the investments already decided and identify new investments which have to be executed in the next three years; and

(c) provide for a time frame for all investment projects.

3. When elaborating the ten-year network development plan, the transmission system operator shall make reasonable assumptions about the evolution of the production, supply, consumption and exchanges with other countries, taking into account investment plans for regional and **Energy Community**-wide networks, as well as investment plans for storage and LNG regasification facilities.

4. The regulatory authority shall consult all actual or potential system users on the ten-year network development plan in an open and transparent manner. Persons or undertakings claiming to be potential system users may be required to substantiate such claims. The regulatory authority shall publish the result of the consultation process, in particular possible needs for investments.

5. The regulatory authority shall examine whether the ten-year network development plan covers all investment needs identified during the consultation process <...>. The regulatory authority may require the transmission system operator to amend its ten-year network development plan.

6. The regulatory authority shall monitor and evaluate the implementation of the ten-year network development plan.

7. In circumstances where the transmission system operator, other than for overriding reasons beyond its control, does not execute an investment, which, under the ten-year network development plan, was to be executed in the following three years, **Contracting Parties** shall ensure that the regulatory authority is required to take at least one of the following measures to ensure that the investment in question is made if such investment is still relevant on the basis of the most recent ten-year network development plan:

- (a) to require the transmission system operator to execute the investments in question;
- (b) to organise a tender procedure open to any investors for the investment in question; or
- (c) to oblige the transmission system operator to accept a capital increase to finance the necessary investments and allow independent investors to participate in the capital.

Where the regulatory authority has made use of its powers under point (b) of the first subparagraph, it may oblige the transmission system operator to agree to one or more of the following:

- (a) financing by any third party;
- (b) construction by any third party;
- (c) building the new assets concerned itself;
- (d) operating the new asset concerned itself.

The transmission system operator shall provide the investors with all information needed to realise the investment, shall connect new assets to the transmission network and shall generally make its best efforts to facilitate the implementation of the investment project.

The relevant financial arrangements shall be subject to approval by the regulatory authority.

8. Where the regulatory authority has made use of its powers under the first subparagraph of paragraph 7, the relevant tariff regulations shall cover the costs of the investments in question.

### **Article 23**

#### **Decision-making powers regarding the connection of storage facilities, LNG regasification facilities and industrial customers to the transmission system**

1. The transmission system operator shall establish and publish transparent and efficient procedures and tariffs for non-discriminatory connection of storage facilities, LNG regasification facilities and industrial customers to the transmission system. Those procedures shall be subject to approval by the regulatory authority.

2. The transmission system operator shall not be entitled to refuse the connection of a new storage facility, LNG regasification facility or industrial customer on the grounds of possible future limitations to available network capacities or additional costs linked with necessary capacity increase. The transmission system operator shall ensure sufficient entry and exit capacity for the new connection.

## CHAPTER V

### DISTRIBUTION AND SUPPLY

#### *Article 24*

#### **Designation of distribution system operators**

**Contracting Parties** shall designate, or shall require undertakings which own or are responsible for distribution systems to designate, for a period of time to be determined by **Contracting Parties**, having regard to considerations of efficiency and economic balance, one or more distribution system operators and shall ensure that those operators act in accordance with Articles 25, 26 and 27.

#### *Article 25*

#### **Tasks of distribution system operators**

1. Each distribution system operator shall be responsible for ensuring the long-term ability of the system to meet reasonable demands for the distribution of gas, and for operating, maintaining and developing under economic conditions a secure, reliable and efficient system in its area, with due regard for the environment and energy efficiency.
2. In any event, the distribution system operator shall not discriminate between system users or classes of system users, particularly in favour of its related undertakings.
3. Each distribution system operator shall provide any other distribution, transmission, LNG, and/or storage system operator with sufficient information to ensure that the transport and storage of natural gas takes place in a manner compatible with the secure and efficient operation of the inter-connected system.
4. Each distribution system operator shall provide system users with the information they need for efficient access to, including use of, the system.
5. Where a distribution system operator is responsible for balancing the distribution system, rules adopted by it for that purpose shall be objective, transparent and non-discriminatory, including rules for the charging of system users for energy imbalance. Terms and conditions, including rules and tariffs, for the provision of such services by distribution system operators shall be established pursuant to a methodology compatible with Article 41(6) in a non-discriminatory and cost-reflective way and shall be published.

#### *Article 26*

#### **Unbundling of distribution system operators**

1. Where the distribution system operator is part of a vertically integrated undertaking, it shall be independent at least in terms of its legal form, organisation and decision making from other activities not relating to distribution. Those rules shall not create an obligation to separate the ownership of assets of the distribution system from the vertically integrated undertaking.

2. In addition to the requirements under paragraph 1, where the distribution system operator is part of a vertically integrated undertaking, it shall be independent in terms of its organisation and decision-making from the other activities not related to distribution. In order to achieve this, the following minimum criteria shall apply:

(a) those persons responsible for the management of the distribution system operator must not participate in company structures of the integrated natural gas undertaking responsible, directly or indirectly, for the day-to-day operation of the production, transmission and supply of natural gas;

(b) appropriate measures must be taken to ensure that the professional interests of persons responsible for the management of the distribution system operator are taken into account in a manner that ensures that they are capable of acting independently;

(c) the distribution system operator must have effective decision-making rights, independent from the integrated natural gas undertaking, with respect to assets necessary to operate, maintain or develop the network. In order to fulfill those tasks, the distribution system operator shall have at its disposal the necessary resources including human, technical, financial and physical resources. This should not prevent the existence of appropriate coordination mechanisms to ensure that the economic and management supervision rights of the parent company in respect of return on assets, regulated indirectly in accordance with Article 41(6) in a subsidiary are protected. In particular, this shall enable the parent company to approve the annual financial plan, or any equivalent instrument, of the distribution system operator and to set global limits on the levels of indebtedness of its subsidiary. It shall not permit the parent company to give instructions regarding day-to-day operations, nor with respect to individual decisions concerning the construction or upgrading of distribution lines, that do not exceed the terms of the approved financial plan, or any equivalent instrument; and

(d) the distribution system operator must establish a compliance programme, which sets out measures taken to ensure that discriminatory conduct is excluded, and ensure that observance of it is adequately monitored. The compliance programme shall set out the specific obligations of employees to meet that objective. An annual report, setting out the measures taken, shall be submitted by the person or body responsible for monitoring the compliance programme, the compliance officer of the distribution system operator, to the regulatory authority referred to in Article 39(1) and shall be published. The compliance officer of the distribution system operator shall be fully independent and shall have access to all the necessary information of the distribution system operator and any affiliated undertaking to fulfill his task.

3. Where the distribution system operator is part of a vertically integrated undertaking, the **Contracting Parties** shall ensure that the activities of the distribution system operator are monitored by regulatory authorities or other competent bodies so that it cannot take advantage of its vertical integration to distort competition. In particular, vertically integrated distribution system operators shall not, in their communication and branding, create confusion in respect of the separate identity of the supply branch of the vertically integrated undertaking.

4. **Contracting Parties** may decide not to apply paragraphs 1, 2 and 3 to integrated natural gas undertakings serving less than 100 000 connected customers.

### **Article 27**

#### **Confidentiality obligations of distribution system operators**

1. Without prejudice to Article 30 or any other legal duty to disclose information, each distribution system operator shall preserve the confidentiality of commercially sensitive information obtained in the course of carrying out its business, and shall prevent information about its own activities which may be commercially advantageous from being disclosed in a discriminatory manner.
2. Distribution system operators shall not, in the context of sales or purchases of natural gas by related undertakings, abuse commercially sensitive information obtained from third parties in the context of providing or negotiating access to the system.

### **Article 28**

#### **Closed distribution systems**

1. **Contracting Parties** may provide for national regulatory authorities or other competent authorities to classify a system which distributes gas within a geographically confined industrial, commercial or shared services site and does not, without prejudice to paragraph 4, supply household customers, as a closed distribution system if:
  - (a) for specific technical or safety reasons, the operations or the production process of the users of that system are integrated; or
  - (b) that system distributes gas primarily to the owner or operator of the system or to their related undertakings.
2. **Contracting Parties** may provide for national regulatory authorities to exempt the operator of a closed distribution system from the requirement under Article 32(1) that tariffs, or the methodologies underlying their calculation, are approved prior to their entry into force in accordance with Article 41.
3. Where an exemption is granted under paragraph 2, the applicable tariffs, or the methodologies underlying their calculation, shall be reviewed and approved in accordance with Article 41 upon request by a user of the closed distribution system.
4. Incidental use by a small number of households with employment or similar associations with the owner of the distribution system and located within the area served by a closed distribution system shall not preclude an exemption under paragraph 2 being granted.

### **Article 29**

#### **Combined operator**

Article 26(1) shall not prevent the operation of a combined transmission, LNG, storage and distribution system operator provided that operator complies with Articles 9(1), or 14 and 15, or Chapter IV or falls under Article 49(6).

## CHAPTER VI

### UNBUNDLING AND TRANSPARENCY OF ACCOUNTS

#### *Article 30*

##### **Right of access to accounts**

1. **Contracting Parties** or any competent authority they designate, including the regulatory authorities referred to in Article 39(1) and the dispute settlement authorities referred to in Article 34(3) shall, insofar as necessary to carry out their functions, have right of access to the accounts of natural gas undertakings as set out in Article 31.

2. **Contracting Parties** and any designated competent authority, including the regulatory authorities referred to in Article 39(1) and the dispute settlement authorities, shall preserve the confidentiality of commercially sensitive information. Contracting Parties may provide for the disclosure of such information where this is necessary in order for the competent authorities to carry out their functions.

#### *Article 31*

##### **Unbundling of accounts**

1. **Contracting Parties** shall take the necessary steps to ensure that the accounts of natural gas undertakings are kept in accordance with paragraphs 2 to 5 of this Article. Where natural gas undertakings benefit from a derogation from this provision on the basis of Article 49(2) and (4), they shall at least keep their internal accounts in accordance with this Article.

2. Natural gas undertakings, whatever their system of ownership or legal form, shall draw up, submit to audit and publish their annual accounts in accordance with the rules of national law concerning the annual accounts of limited liability companies which should comply with the Fourth Council Directive 78/660/EEC of 25 July 1978 based on Article 44(2)(g) of the Treaty on the annual accounts of certain types of companies.

Undertakings which are not legally obliged to publish their annual accounts shall keep a copy thereof at the disposal of the public at their head office.

3. Natural gas undertakings shall, in their internal accounting, keep separate accounts for each of their transmission, distribution, LNG and storage activities as they would be required to do if the activities in question were carried out by separate undertakings, with a view to avoiding discrimination, cross-subsidisation and distortion of competition. They shall also keep accounts, which may be consolidated, for other gas activities not relating to transmission, distribution, LNG and storage. Until **1 January 2015**, they shall keep separate accounts for supply activities for eligible customers and supply activities for non-eligible customers. Revenue from ownership of the transmission or distribution network shall be specified in the accounts. Where appropriate, they shall keep consolidated accounts for other, non-gas activities. The internal accounts shall include a balance sheet and a profit and loss account for each activity.

4. The audit, referred to in paragraph 2, shall, in particular, verify that the obligation to avoid discrimination and cross-subsidies referred to in paragraph 3 is respected.

5. Undertakings shall specify in their internal accounting the rules for the allocation of assets and liabilities, expenditure and income as well as for depreciation, without prejudice to nationally applicable accounting rules, which they follow in drawing up the separate accounts referred to in paragraph 3. Those internal rules may be amended only in exceptional cases. Such amendments shall be mentioned and duly substantiated.

6. The annual accounts shall indicate in notes any transaction of a certain size conducted with related undertakings.

## CHAPTER VII

### ORGANISATION OF ACCESS TO THE SYSTEM

#### *Article 32*

##### **Third-party access**

1. **Contracting Parties** shall ensure the implementation of a system of third party access to the transmission and distribution system, and LNG facilities based on published tariffs, applicable to all eligible customers, including supply undertakings, and applied objectively and without discrimination between system users. **Contracting Parties** shall ensure that those tariffs, or the methodologies underlying their calculation are approved prior to their entry into force in accordance with Article 41 by a regulatory authority referred to in Article 39(1) and that those tariffs - and the methodologies, where only methodologies are approved - are published prior to their entry into force.

2. Transmission system operators shall, if necessary for the purpose of carrying out their functions including in relation to cross-border transmission, have access to the network of other transmission system operators.

3. The provisions of this Directive shall not prevent the conclusion of long-term contracts in so far as they comply with **Energy Community** competition rules.

#### *Article 33*

##### **Access to storage**

1. For the organisation of access to storage facilities and linepack when technically and/or economically necessary for providing efficient access to the system for the supply of customers, as well as for the organisation of access to ancillary services, Contracting Parties may choose either or both of the procedures referred to in paragraphs 3 and 4. Those procedures shall operate in accordance with objective, transparent and non-discriminatory criteria.

The regulatory authorities where **Contracting Parties** have so provided or **Contracting Parties** shall define and publish criteria according to which the access regime applicable to storage facilities and linepack may be determined. They shall make public, or oblige storage and transmission system operators to make public, which storage facilities, or which parts of those storage facilities, and

which linepack is offered under the different procedures referred to in paragraphs 3 and 4.

The obligation referred to in the second sentence of the second subparagraph shall be without prejudice to the right of choice granted to **Contracting Parties** in the first subparagraph.

2. The provisions of paragraph 1 shall not apply to ancillary services and temporary storage that are related to LNG facilities and are necessary for the re-gasification process and subsequent delivery to the transmission system.

3. In the case of negotiated access, **Contracting Parties** or, where **Contracting Parties** have so provided, the regulatory authorities shall take the necessary measures for natural gas undertakings and eligible customers either inside or outside the territory covered by the interconnected system to be able to negotiate access to storage facilities and linepack, when technically and/or economically necessary for providing efficient access to the system, as well as for the organisation of access to other ancillary services. The parties shall be obliged to negotiate access to storage, linepack and other ancillary services in good faith.

Contracts for access to storage, linepack and other ancillary services shall be negotiated with the relevant storage system operator or natural gas undertakings. The regulatory authorities where **Contracting Parties** have so provided or **Contracting Parties** shall require storage system operators and natural gas undertakings to publish their main commercial conditions for the use of storage, linepack and other ancillary services **1 January 2007** and on an annual basis every year thereafter.

When developing the conditions referred to in the second subparagraph, storage operators and natural gas undertakings shall consult system users.

4. In the case of regulated access, **the regulatory authorities where Contracting Parties** have so provided or **Contracting Parties** shall take the necessary measures to give natural gas undertakings and eligible customers either inside or outside the territory covered by the interconnected system a right to access to storage, linepack and other ancillary services, on the basis of published tariffs and/or other terms and obligations for use of that storage and linepack, when technically and/or economically necessary for providing efficient access to the system, as well as for the organisation of access to other ancillary services. The regulatory authorities where **Contracting Parties** have so provided or **Contracting Parties** shall consult system users when developing those tariffs or the methodologies for those tariffs. The right of access for eligible customers may be given by enabling them to enter into supply contracts with competing natural gas undertakings other than the owner and/or operator of the system or a related undertaking.

### **Article 34**

#### **Access to upstream pipeline networks**

1. **Contracting Parties** shall take the necessary measures to ensure that natural gas undertakings and eligible customers, wherever they are located, are able to obtain access to upstream pipeline networks, including facilities supplying technical services incidental to such access, in accordance with this Article, except for the parts of such networks and facilities which are used for local production operations at the site of a field where the gas is produced. The measures shall be notified to the **Energy Community Secretariat**.

2. The access referred to in paragraph 1 shall be provided in a manner determined by the **Contract-**

**ing Party** in accordance with the relevant legal instruments. **Contracting Parties** shall apply the objectives of fair and open access, achieving a competitive market in natural gas and avoiding any abuse of a dominant position, taking into account security and regularity of supplies, capacity which is or can reasonably be made available, and environmental protection. The following matters may be taken into account:

- (a) the need to refuse access where there is an incompatibility of technical specifications which cannot reasonably be overcome;
- (b) the need to avoid difficulties which cannot reasonably be overcome and could prejudice the efficient, current and planned future production of hydrocarbons, including that from fields of marginal economic viability;
- (c) the need to respect the duly substantiated reasonable needs of the owner or operator of the upstream pipeline network for the transport and processing of gas and the interests of all other users of the upstream pipeline network or relevant processing or handling facilities who may be affected; and
- (d) the need to apply their laws and administrative procedures, in conformity with **Energy Community law**, for the grant of authorisation for production or upstream development.

3. **Contracting Parties** shall ensure that they have in place dispute-settlement arrangements, including an authority independent of the parties with access to all relevant information, to enable disputes relating to access to upstream pipeline networks to be settled expeditiously, taking into account the criteria in paragraph 2 and the number of parties which may be involved in negotiating access to such networks.

4. In the event of cross-border disputes, the dispute-settlement arrangements for the **Contracting Party** having jurisdiction over the upstream pipeline network which refuses access shall be applied. Where, in cross-border disputes, more than one **Contracting Party** covers the network concerned, the **Contracting Parties** concerned shall consult each other with a view to ensuring that the provisions of this Directive are applied consistently.

### **Article 35**

#### **Refusal of access**

1. Natural gas undertakings may refuse access to the system on the basis of lack of capacity or where the access to the system would prevent them from carrying out the public service obligations referred to in Article 3(2) which are assigned to them or on the basis of serious economic and financial difficulties with take-or-pay contracts having regard to the criteria and procedures set out in Article 48 and the alternative chosen by the **Contracting Party** in accordance with paragraph 1 of that Article. Duly substantiated reasons shall be given for any such a refusal.

2. **Contracting Parties** may take the measures necessary to ensure that the natural gas undertaking refusing access to the system on the basis of lack of capacity or a lack of connection makes the necessary enhancements as far as it is economic to do so or when a potential customer is willing to pay for them. In circumstances where **Contracting Parties** apply Article 4(4), **Contracting Parties** shall take such measures.

## Article 36

### New infrastructure

1. Major new gas infrastructure, i.e. interconnectors, LNG and storage facilities, may, upon request, be exempted, for a defined period of time, from the provisions of Articles 9, 32, 33 and 34 and Article 41(6), (8) and (10) under the following conditions:

- (a) the investment must enhance competition in gas supply and enhance security of supply;
- (b) the level of risk attached to the investment must be such that the investment would not take place unless an exemption was granted;
- (c) the infrastructure must be owned by a natural or legal person which is separate at least in terms of its legal form from the system operators in whose systems that infrastructure will be built;
- (d) charges must be levied on users of that infrastructure; and
- (e) the exemption must not be detrimental to competition or the effective functioning of the internal market in natural gas, or the efficient functioning of the regulated system to which the infrastructure is connected.

2. Paragraph 1 shall also apply to significant increases of capacity in existing infrastructure and to modifications of such infrastructure which enable the development of new sources of gas supply.

3. The regulatory authority referred to in Chapter VIII may, on a case-by-case basis, decide on the exemption referred to in paragraphs 1 and 2.

4. Where the infrastructure in question is located in the territory of more than one **Contracting Party**, the **Energy Community Regulatory Board** may submit an advisory opinion to the regulatory authorities of the **Contracting Parties** concerned, which may be used as a basis for their decision, within two months from the date on which the request for exemption was received by the last of those regulatory authorities.

Where all the regulatory authorities concerned agree on the request for exemption within six months of the date on which it was received by the last of the regulatory authorities, they shall inform the **Energy Community Regulatory Board** of their decision.

The **Energy Community Regulatory Board** shall exercise the tasks conferred on the regulatory authorities of the **Contracting Parties** concerned by the present Article:

- (a) where all regulatory authorities concerned have not been able to reach an agreement within a period of six months from the date on which the request for exemption was received by the last of those regulatory authorities; or
- (b) upon a joint request from the regulatory authorities concerned.

All regulatory authorities concerned may, jointly, request that the period referred to in point (a) of the third subparagraph is extended by up to three months.

5. Before taking a decision, the **Energy Community Regulatory Board** shall consult the relevant regulatory authorities and the applicants.

6. An exemption may cover all or part of the capacity of the new infrastructure, or of the existing infrastructure with significantly increased capacity.

In deciding to grant an exemption, consideration shall be given, on a case-by-case basis, to the need

to impose conditions regarding the duration of the exemption and non-discriminatory access to the infrastructure. When deciding on those conditions, account shall, in particular, be taken of the additional capacity to be built or the modification of existing capacity, the time horizon of the project and national circumstances.

Before granting an exemption, the regulatory authority shall decide upon the rules and mechanisms for management and allocation of capacity. The rules shall require that all potential users of the infrastructure are invited to indicate their interest in contracting capacity before capacity allocation in the new infrastructure, including for own use, takes place. The regulatory authority shall require congestion management rules to include the obligation to offer unused capacity on the market, and shall require users of the infrastructure to be entitled to trade their contracted capacities on the secondary market. In its assessment of the criteria referred to in points (a), (b) and (e) of paragraph 1, the regulatory authority shall take into account the results of that capacity allocation procedure.

The exemption decision, including any conditions referred to in the second subparagraph of this paragraph, shall be duly reasoned and published.

7. Notwithstanding paragraph 3, **Contracting Parties** may provide that their regulatory authority or the **Energy Community Regulatory Board**, as the case may be, shall submit, for the purposes of the formal decision, to the relevant body in the **Contracting Party** its opinion on the request for an exemption. That opinion shall be published together with the decision.

8. The regulatory authority shall transmit to the **Energy Community Secretariat**, without delay, a copy of every request for exemption as of its receipt. The decision shall be notified, without delay, by the competent authority to the **Energy Community Secretariat**, together with all the relevant information with respect to the decision. That information may be submitted to the **Energy Community Secretariat** in aggregate form, enabling the **Energy Community Secretariat** to reach a well-founded decision. In particular, the information shall contain:

- (a) the detailed reasons on the basis of which the regulatory authority, or **Contracting Party**, granted or refused the exemption together with a reference to paragraph 1 including the relevant point or points of that paragraph on which such decision is based, including the financial information justifying the need for the exemption;
- (b) the analysis undertaken of the effect on competition and the effective functioning of the internal market in natural gas resulting from the grant of the exemption;
- (c) the reasons for the time period and the share of the total capacity of the gas infrastructure in question for which the exemption is granted;
- (d) in case the exemption relates to an interconnector, the result of the consultation with the regulatory authorities concerned; and
- (e) the contribution of the infrastructure to the diversification of gas supply.

9. Within a period of two months from the day following the receipt of a notification, the **Secretariat** may issue an opinion inviting the regulatory authority to amend or withdraw the decision to grant an exemption. That two-month period may be extended by an additional period of two months where further information is sought by the **Energy Community Secretariat**. That additional period shall begin on the day following the receipt of the complete information. The initial two-month period may also be extended with the consent of both the **Energy Community Secretariat** and the regulatory authority.

Where the requested information is not provided within the period set out in the request, the notification shall be deemed to be withdrawn unless, before the expiry of that period, either the period has been extended with the consent of both the **Energy Community Secretariat** and the regulatory authority, or the regulatory authority, in a duly reasoned statement, has informed the **Energy Community Secretariat** that it considers the notification to be complete.

**The notifying bodies shall take the utmost account of a Secretariat opinion that recommends to amend or withdraw the exemption decision. Where the final decision diverges from the Secretariat's opinion, the regulatory authority concerned shall provide and publish, together with that decision, the reasoning underlying its decision. Diverting decisions shall be included in the agenda of the first meeting of the Ministerial Council following the date of the decision, for information and discussion.**

The **Secretariat** shall preserve the confidentiality of commercially sensitive information.

The **Secretariat's** opinion on an exemption decision shall lose its effect two years from its adoption in the event that construction of the infrastructure has not yet started, and five years from its adoption in the event that the infrastructure has not become operational unless the **Secretariat** considers that any delay is due to major obstacles beyond control of the person to whom the exemption has been granted.

10. <...>

### **Article 37**

#### **Market opening and reciprocity**

1. **Contracting Parties** shall ensure that the eligible customers comprise<sup>6</sup>:

- (a) <...>;
- (b) **from 1 January 2008**, all non-household customers;
- (c) **from 1 January 2015**, all customers.

2. To avoid imbalance in the opening of the gas markets:

- (a) contracts for the supply with an eligible customer in the system of another **Contracting Party** shall not be prohibited if the customer is eligible in both systems involved; and
- (b) <...>.

### **Article 38**

#### **Direct lines**

1. **Contracting Parties** shall take the necessary measures to enable:

- (a) natural gas undertakings established within their territory to supply the eligible customers through a direct line; and,
- (b) any such eligible customer within their territory to be supplied through a direct line by natural

<sup>6</sup> According to Article 17(2) of Decision 2011/02/MC-EnC, the following deadlines 'shall apply without prejudice to special deadlines agreed in the Protocols of Accession to the Energy Community'.

gas undertakings.

2. In circumstances where an authorisation (for example, licence, permission, concession, consent or approval) is required for the construction or operation of direct lines, the **Contracting Parties** or any competent authority they designate shall lay down the criteria for the grant of authorisations for the construction or operation of such lines in their territory. Those criteria shall be objective, transparent and non-discriminatory.

3. **Contracting Parties** may issue an authorisation to construct a direct line subject either to the refusal of system access on the basis of Article 35 or to the opening of a dispute-settlement procedure under Article 41.

## CHAPTER VIII

### NATIONAL REGULATORY AUTHORITIES

#### *Article 39*

#### **Designation and independence of regulatory authorities**

1. Each **Contracting Party** shall designate a single national regulatory authority at national level.
2. Paragraph 1 of this Article shall be without prejudice to the designation of other regulatory authorities at regional level within **Contracting Parties**, provided that there is one senior representative for representation and contact purposes at **Energy Community** level.
3. By way of derogation from paragraph 1 of this Article, a **Contracting Party** may designate regulatory authorities for small systems on a geographically separate region whose consumption, in 2008, accounted for less than 3% of the total consumption of the **Contracting Party** of which it is part. That derogation shall be without prejudice to the appointment of one senior representative for representation and contact purposes at **Energy Community** level.
4. **Contracting Parties** shall guarantee the independence of the regulatory authority and shall ensure that it exercises its powers impartially and transparently. For this purpose, **Contracting Parties** shall ensure that, when carrying out the regulatory tasks conferred upon it by this Directive and related legislation, the regulatory authority:
  - (a) is legally distinct and functionally independent from any other public or private entity;
  - (b) ensures that its staff and the persons responsible for its management:
    - (i) act independently from any market interest; and
    - (ii) do not seek or take direct instructions from any government or other public or private entity when carrying out the regulatory tasks. That requirement is without prejudice to close cooperation, as appropriate, with other relevant national authorities or to general policy guidelines issued by the government not related to the regulatory powers and duties under Article 41.
5. In order to protect the independence of the regulatory authority, **Contracting Parties** shall in particular ensure that:
  - (a) the regulatory authority can take autonomous decisions, independently from any political body, and has separate annual budget allocations, with autonomy in the implementation of the allocated

budget, and adequate human and financial resources to carry out its duties; and

(b) the members of the board of the regulatory authority or, in the absence of a board, the regulatory authority's top management are appointed for a fixed term of five up to seven years, renewable once.

In regard to point (b) of the first subparagraph, **Contracting Parties** shall ensure an appropriate rotation scheme for the board or the top management. The members of the board or, in the absence of a board, members of the top management may be relieved from office during their term only if they no longer fulfill the conditions set out in this Article or have been guilty of misconduct under national law.

### **Article 40**

#### **General objectives of the regulatory authority**

In carrying out the regulatory tasks specified in this Directive, the regulatory authority shall take all reasonable measures in pursuit of the following objectives within the framework of their duties and powers as laid down in Article 41, in close consultation with other relevant national authorities, including competition authorities, as appropriate, and without prejudice to their competencies:

(a) promoting, in close cooperation with the **Energy Community Regulatory Board**, regulatory authorities of other **Contracting Parties** and the **Energy Community Secretariat**, a competitive, secure and environmentally sustainable internal market in natural gas within the **Energy Community**, and effective market opening for all customers and suppliers in the **Energy Community**, and ensuring appropriate conditions for the effective and reliable operation of gas networks, taking into account long-term objectives;

(b) developing competitive and properly functioning regional markets within the **Energy Community** in view of the achievement of the objectives referred to in point (a);

(c) eliminating restrictions on trade in natural gas between **Contracting Parties**, including developing appropriate cross-border transmission capacities to meet demand and enhancing the integration of national markets which may facilitate natural gas flow across the **Energy Community**;

(d) helping to achieve, in the most cost-effective way, the development of secure, reliable and efficient non-discriminatory systems that are consumer oriented, and promoting system adequacy and, in line with general energy policy objectives, energy efficiency as well as the integration of large and small scale production of gas from renewable energy sources and distributed production in both transmission and distribution networks;

(e) facilitating access to the network for new production capacity, in particular removing barriers that could prevent access for new market entrants and of gas from renewable energy sources;

(f) ensuring that system operators and system users are granted appropriate incentives, in both the short and the long term, to increase efficiencies in system performance and foster market integration;

(g) ensuring that customers benefit through the efficient functioning of their national market, promoting effective competition and helping to ensure consumer protection;

(h) helping to achieve high standards of public service for natural gas, contributing to the protection

of vulnerable customers and contributing to the compatibility of necessary data exchange processes for customer switching.

### **Article 41**

#### **Duties and powers of the regulatory authority**

1. The regulatory authority shall have the following duties:

(a) fixing or approving, in accordance with transparent criteria, transmission or distribution tariffs or their methodologies;

(b) ensuring compliance of transmission and distribution system operators, and where relevant, system owners, as well as of any natural gas undertakings, with their obligations under this Directive and other relevant **Energy Community** legislation, including as regards cross-border issues;

(c) cooperating in regard to cross-border issues with the regulatory authority or authorities of the **Contracting Parties** concerned and with the **Energy Community Regulatory Board**;

(d) complying with, and implementing, any relevant legally binding decisions of the **Energy Community Regulatory Board** <...>;

(e) reporting annually on its activity and the fulfillment of its duties to the relevant authorities of the **Contracting Parties**, to the **Energy Community Regulatory Board** and the **Energy Community Secretariat**. Such reports shall cover the steps taken and the results obtained as regards each of the tasks listed in this Article;

(f) ensuring that there are no cross-subsidies between transmission, distribution, storage, LNG and supply activities;

(g) monitoring investment plans of the transmission system operators, and providing in its annual report an assessment of the investment plans of the transmission system operators <...>; which may include recommendations to amend those investment plans;

(h) monitoring compliance with and reviewing the past performance of network security and reliability rules and setting or approving standards and requirements for quality of service and supply or contributing thereto together with other competent authorities;

(i) monitoring the level of transparency, including of wholesale prices, and ensuring compliance of natural gas undertakings with transparency obligations;

(j) monitoring the level and effectiveness of market opening and competition at wholesale and retail levels, including on natural gas exchanges, prices for household customers including prepayment systems, switching rates, disconnection rates, charges for and the execution of maintenance services and complaints by household customers, as well as any distortion or restriction of competition, including providing any relevant information, and bringing any relevant cases to the relevant competition authorities;

(k) monitoring the occurrence of restrictive contractual practices, including exclusivity clauses which may prevent large non-household customers from contracting simultaneously with more than one supplier or restrict their choice to do so, and, where appropriate, informing the national competition authorities of such practices;

(l) respecting contractual freedom with regard to interruptible supply contracts as well as with regard

to long-term contracts provided that they are compatible with **Energy Community law**;

(m) monitoring the time taken by transmission and distribution system operators to make connections and repairs;

(n) monitoring and reviewing the access conditions to storage, linepack and other ancillary services as provided for in Article 33. In the event that the access regime to storage is defined according to Article 33(3), that task shall exclude the reviewing of tariffs;

(o) helping to ensure, together with other relevant authorities, that the consumer protection measures, including those set out in Annex I, are effective and enforced;

(p) publishing recommendations, at least annually, in relation to compliance of supply prices with Article 3, and providing those to the competition authorities, where appropriate;

(q) ensuring access to customer consumption data, the provision for optional use, of an easily understandable harmonised format at national level for consumption data and prompt access for all customers to such data under point (h) of Annex I;

(r) monitoring the implementation of rules relating to the roles and responsibilities of transmission system operators, distribution system operators, suppliers and customers and other market parties pursuant to Regulation (EC) No 715/2009, **as adapted under Article 24 of the Energy Community Treaty**;

(s) monitoring the correct application of the criteria that determine whether a storage facility falls under Article 33(3) or (4); and

(t) monitoring the implementation of safeguards measures as referred to in Article 46;

(u) contributing to the compatibility of data exchange processes for the most important market processes at regional level.

2. Where a **Contracting Party** has so provided, the monitoring duties set out in paragraph 1 may be carried out by other authorities than the regulatory authority. In such a case, the information resulting from such monitoring shall be made available to the regulatory authority as soon as possible. While preserving their independence, without prejudice to their own specific competencies and consistent with the principles of better regulation, the regulatory authority shall, as appropriate, consult transmission system operators and, as appropriate, closely cooperate with other relevant national authorities when carrying out the duties set out in paragraph 1.

Any approvals given by a regulatory authority or the **Energy Community Regulatory Board** under this Directive are without prejudice to any duly justified future use of its powers by the regulatory authority under this Article or to any penalties imposed by other relevant authorities <...>.

3. In addition to the duties conferred upon it under paragraph 1 of this Article, when an independent system operator has been designated under Article 14, the regulatory authority shall:

(a) monitor the transmission system owner's and the independent system operator's compliance with their obligations under this Article, and issue penalties for non compliance in accordance with paragraph 4(d);

(b) monitor the relations and communications between the independent system operator and the transmission system owner so as to ensure compliance of the independent system operator with its obligations, and in particular approve contracts and act as a dispute settlement authority between the independent system operator and the transmission system owner in respect of any complaint

submitted by either party pursuant to paragraph 11;

(c) without prejudice to the procedure under Article 14(2)(c), for the first ten-year network development plan, approve the investments planning and the multi-annual network development plan presented annually by the independent system operator;

(d) ensure that network access tariffs collected by the independent system operator include remuneration for the network owner or network owners, which provides for adequate remuneration of the network assets and of any new investments made therein, provided they are economically and efficiently incurred; and

(e) have the powers to carry out inspections, including unannounced inspections, at the premises of transmission system owner and independent system operator.

4. **Contracting Parties** shall ensure that regulatory authorities are granted the powers enabling them to carry out the duties referred to in paragraph 1, 3 and 6 in an efficient and expeditious manner. For this purpose, the regulatory authority shall have at least the following powers:

(a) to issue binding decisions on natural gas undertakings;

(b) to carry out investigations into the functioning of the gas markets, and to decide upon and impose any necessary and proportionate measures to promote effective competition and ensure the proper functioning of the market. Where appropriate, the regulatory authority shall also have the power to cooperate with the national competition authority and the financial market regulators or the **Energy Community Secretariat** in conducting an investigation relating to competition law;

(c) to require any information from natural gas undertakings relevant for the fulfillment of its tasks, including the justification for any refusal to grant third-party access, and any information on measures necessary to reinforce the network;

(d) to impose effective, proportionate and dissuasive penalties on natural gas undertakings not complying with their obligations under this Directive or any relevant legally binding decisions of the regulatory authority or of the **Energy Community Regulatory Board**, or to propose to a competent court to impose such penalties. This shall include the power to impose or propose the imposition of penalties of up to 10% of the annual turnover of the transmission system operator or of up to 10% of the annual turnover of the vertically integrated undertaking on the transmission system operator or on the vertically integrated undertaking, as the case may be, for non compliance with their respective obligations pursuant to this Directive; and

(e) appropriate rights of investigations and relevant powers of instructions for dispute settlement under paragraphs 11 and 12.

5. In addition to the duties and powers conferred on it under paragraphs 1 and 4 of this Article, when a transmission system operator has been designated in accordance with Chapter IV, the regulatory authority shall be granted at least the following duties and powers:

(a) to issue penalties in accordance with paragraph 4(d) for discriminatory behaviour in favour of the vertically integrated undertaking;

(b) to monitor communications between the transmission system operator and the vertically integrated undertaking so as to ensure compliance of the transmission system operator with its obligations;

(c) to act as dispute settlement authority between the vertically integrated undertaking and the transmission system operator in respect of any complaint submitted pursuant to paragraph 11;

(d) to monitor commercial and financial relations including loans between the vertically integrated

undertaking and the transmission system operator;

(e) to approve all commercial and financial agreements between the vertically integrated undertaking and the transmission system operator, on the condition that they comply with market conditions;

(f) to request justification from the vertically integrated undertaking when notified by the compliance officer in accordance with Article 21(4). Such justification shall in particular include evidence to the end that no discriminatory behaviour to the advantage of the vertically integrated undertaking has occurred;

(g) to carry out inspections, including unannounced inspections, on the premises of the vertically integrated undertaking and the transmission system operator; and

(h) to assign all or specific tasks of the transmission system operator to an independent system operator appointed in accordance with Article 14 in case of a persistent breach by the transmission system operator of its obligations under this Directive, in particular in case of repeated discriminatory behaviour to the benefit of the vertically integrated undertaking.

6. The regulatory authorities shall be responsible for fixing or approving sufficiently in advance of their entry into force at least the methodologies used to calculate or establish the terms and conditions for:

(a) connection and access to national networks, including transmission and distribution tariffs, and terms, conditions and tariffs for access to LNG facilities. Those tariffs or methodologies shall allow the necessary investments in the networks and LNG facilities to be carried out in a manner allowing those investments to ensure the viability of the networks and LNG facilities;

(b) the provision of balancing services which shall be performed in the most economic manner and provide appropriate incentives for network users to balance their input and off-takes. The balancing services shall be provided in a fair and non-discriminatory manner and be based on objective criteria; and

(c) access to cross-border infrastructures, including the procedures for the allocation of capacity and congestion management.

7. The methodologies or the terms and conditions referred to in paragraph 6 shall be published.

8. In fixing or approving the tariffs or methodologies and the balancing services, the regulatory authorities shall ensure that transmission and distribution system operators are granted appropriate incentive, over both the short and long term, to increase efficiencies, foster market integration and security of supply and support the related research activities

9. The regulatory authorities shall monitor congestion management of national gas transmission networks including interconnectors, and the implementation of congestion management rules. To that end, transmission system operators or market operators shall submit their congestion management rules, including capacity allocation, to the national regulatory authorities. National regulatory authorities may request amendments to those rules.

10. Regulatory authorities shall have the authority to require transmission, storage, LNG and distribution system operators, if necessary, to modify the terms and conditions, including tariffs and methodologies referred to in this Article, to ensure that they are proportionate and applied in a non-discriminatory manner. In the event that the access regime to storage is defined according to Article 33(3), that task shall exclude the modification of tariffs. In the event of delay in the fixing of transmission and distribution tariffs, regulatory authorities shall have the power to fix or approve

provisional transmission and distribution tariffs or methodologies and to decide on the appropriate compensatory measures if the final tariffs or methodologies deviate from those provisional tariffs or methodologies.

11. Any party having a complaint against a transmission, storage, LNG or distribution system operator in relation to that operator's obligations under this Directive may refer the complaint to the regulatory authority which, acting as dispute settlement authority, shall issue a decision within a period of two months after receipt of the complaint. That period may be extended by two months where additional information is sought by the regulatory authorities. That extended period may be further extended with the agreement of the complainant. The regulatory authority's decision shall have binding effect unless and until overruled on appeal.

12. Any party who is affected and who has a right to complain concerning a decision on methodologies taken pursuant to this Article or, where the regulatory authority has a duty to consult, concerning the proposed tariffs or methodologies, may, at the latest within two months, or a shorter time period as provided by **Contracting Parties**, following publication of the decision or proposal for a decision, submit a complaint for review. Such a complaint shall not have suspensive effect.

13. **Contracting Parties** shall create appropriate and efficient mechanisms for regulation, control and transparency so as to avoid any abuse of a dominant position, in particular to the detriment of consumers, and any predatory behaviour. Those mechanisms shall take account the provisions of the Treaty, and in particular Article 82 thereof.<sup>7</sup>

14. **Contracting Parties** shall ensure that the appropriate measures are taken, including administrative action or criminal proceedings in conformity with their national law, against the natural or legal persons responsible where confidentiality rules imposed by this Directive have not been respected.

15. Complaints referred to in paragraphs 11 and 12 shall be without prejudice to the exercise of rights of appeal under national law.

16. Decisions taken by regulatory authorities shall be fully reasoned and justified to allow for judicial review. The decisions shall be available to the public while preserving the confidentiality of commercially sensitive information.

17. **Contracting Parties** shall ensure that suitable mechanisms exist at national level under which a party affected by a decision of a regulatory authority has a right of appeal to a body independent of the parties involved and of any government.

## **Article 42**

### **Regulatory regime for cross-border issues**

1. Regulatory authorities shall closely consult and cooperate with each other, and shall provide each other and the **Energy Community Regulatory Board** with any information necessary for the fulfillment of their tasks under this Directive. In respect of the information exchanged, the receiving authority shall ensure the same level of confidentiality as that required of the originating authority.

2. Regulatory authorities shall cooperate at least at a regional level to:

(a) foster the creation of operational arrangements in order to enable an optimal management of

<sup>7</sup> In the Energy Community Treaty, Article 82 of the EC Treaty is incorporated through Article 18 and Annex III.

the network, promote joint gas exchanges and the allocation of cross-border capacity, and to enable an adequate level of interconnection capacity, including through new interconnections, within the region and between regions to allow for development of effective competition and improvement of security of supply without discriminating between supply undertakings in different **Contracting Parties**;

(b) coordinate the development of all network codes for the relevant transmission system operators and other market actors; and

(c) coordinate the development of the rules governing the management of congestion.

3. National regulatory authorities shall have the right to enter into cooperative arrangements with each other to foster regulatory cooperation.

4. The actions referred to in paragraph 2 shall be carried out, as appropriate, in close consultation with other relevant national authorities and without prejudice to their specific competencies.

5. <...>

### **Article 43**

#### **Compliances with the Guidelines<sup>8</sup>**

**The Energy Community shall endeavour to apply the Guidelines adopted by the European Commission under <...> Directive 2009/73/EC, <...> [and] Regulation (EC) No 715/2009.**

**These Guidelines, which may need to be adapted to the institutional framework of the Energy Community, shall be adopted by the Permanent High Level Group, following the procedure laid down in Article 79 of the Treaty.**

**The Permanent High Level Group shall adopt a Procedural Act on application of this article.<sup>9</sup>**

### **Article 44**

#### **Record keeping**

1. **Contracting Parties** shall require supply undertakings to keep at the disposal of the national authorities, including the regulatory authority, the national competition authorities and the **Energy Community Secretariat**, for the fulfillment of their tasks, for at least five years, the relevant data relating to all transactions in gas supply contracts and gas derivatives with wholesale customers and transmission system operators as well as storage and LNG operators.

2. The data shall include details on the characteristics of the relevant transactions such as duration, delivery and settlement rules, the quantity, the dates and times of execution and the transaction prices and means of identifying the wholesale customer concerned, as well as specified details of all unsettled gas supply contracts and gas derivatives.

3. The regulatory authority may decide to make available to market participants elements of this

<sup>8</sup> Not applicable according to Article 21 of Decision 2011/02/MC-EnC. The following text corresponds to Article 27 of Decision 2011/02/MC-EnC.

<sup>9</sup> Procedural Act 01/2012/PHLG-EnC of Permanent High Level Group of 21 June 2012 laying down the rules governing the adoption of Guidelines and Network Codes in the Energy Community was adopted on 21 June 2012.

information provided that commercially sensitive information on individual market players or individual transactions is not released. This paragraph shall not apply to information about financial instruments which fall within the scope of Directive 2004/39/EC.

4. <...>

5. With respect to transactions in gas derivatives of supply undertakings with wholesale customers and transmission system operators as well as storage and LNG operators, this Article shall apply only once **the Permanent High Level Group** has endorsed the Guidelines referred to in paragraph 4.

6. <...>

7. <...>

## CHAPTER IX

### RETAIL MARKETS

#### *Article 45*

#### **Retail markets**

In order to facilitate the emergence of well functioning and transparent retail markets in the **Energy Community, Contracting Parties** shall ensure that the roles and responsibilities of transmission system operators, distribution system operators, supply undertakings and customers and if necessary other market parties are defined with respect to contractual arrangements, commitment to customers, data exchange and settlement rules, data ownership and metering responsibility.

Those rules shall be made public, be designed with the aim to facilitate customers' and suppliers' access to networks and they shall be subject to review by the regulatory authorities or other relevant national authorities.

## CHAPTER X

### FINAL PROVISIONS

#### *Article 46*

#### **Safeguard measures**

1. In the event of a sudden crisis in the energy market or where the physical safety or security of persons, apparatus or installations or system integrity is threatened, a Contracting Party may temporarily take the necessary safeguard measures.

**Instead of the second and third subparagraphs, Articles 36 to 39 of the Energy Community Treaty apply.**

**Article 47****Level playing field**

1. Measures that the **Contracting Parties** may take pursuant to this Directive in order to ensure a level playing field shall be compatible with the Treaty, notably Article 30 thereof,<sup>10</sup> and with **Energy Community law**.
2. The measures referred to in paragraph 1 shall be proportionate, non-discriminatory and transparent. Those measures may be put into effect only **following notification to the Secretariat, which shall issue an opinion**.
3. The **Energy Community Secretariat** shall act on the notification referred to in paragraph 2 within two months of the receipt of the notification. That period shall begin on the day following receipt of the complete information. In the event that the **Energy Community Secretariat** has not acted within that two-month period, it shall be deemed not to have raised objections to the notified measures.

**Article 48****Derogations in relation to take-or-pay commitments**

1. If a natural gas undertaking encounters, or considers it would encounter, serious economic and financial difficulties because of its take-or-pay commitments accepted in one or more gas-purchase contracts, it may send an application for a temporary derogation from Article 32 to the **Contracting Party** concerned or the designated competent authority. Applications shall, in accordance with the choice of **Contracting Parties**, be presented on a case-by-case basis either before or after refusal of access to the system. **Contracting Parties** may also give the natural gas undertaking the choice of presenting an application either before or after refusal of access to the system. Where a natural gas undertaking has refused access, the application shall be presented without delay. The applications shall be accompanied by all relevant information on the nature and extent of the problem and on the efforts undertaken by the natural gas undertaking to solve the problem.

If alternative solutions are not reasonably available, and taking into account paragraph 3, the **Contracting Party** or the designated competent authority may decide to grant a derogation.

2. The **Contracting Party**, or the designated competent authority, shall notify the **Energy Community Secretariat** without delay of its decision to grant a derogation, together with all the relevant information with respect to the derogation. That information may be submitted to the **Energy Community Secretariat** in an aggregated form, enabling the **Energy Community Secretariat** to reach a well-founded decision. Within eight weeks of receipt of that notification, the **Secretariat shall issue an opinion, inviting, as the case may be, the Contracting Party** or the designated competent authority concerned to amend or withdraw the decision to grant a derogation.

<...>

The **Energy Community Secretariat** shall preserve the confidentiality of commercially sensitive information.

<sup>10</sup> Procedural Act 01/2012/PHLG-EnC of Permanent High Level Group of 21 June 2012 laying down the rules governing the adoption of Guidelines and Network Codes in the Energy Community was adopted on 21 June 2012.

3. When deciding on the derogations referred to in paragraph 1, the **Contracting Party**, or the designated competent authority, and the **Energy Community Secretariat** shall take into account, in particular, the following criteria:

- (a) the objective of achieving a competitive gas market;
- (b) the need to fulfill public-service obligations and to ensure security of supply;
- (c) the position of the natural gas undertaking in the gas market and the actual state of competition in that market;
- (d) the seriousness of the economic and financial difficulties encountered by natural gas undertakings and transmission undertakings or eligible customers;
- (e) the dates of signature and terms of the contract or contracts in question, including the extent to which they allow for market changes;
- (f) the efforts made to find a solution to the problem;
- (g) the extent to which, when accepting the take-or-pay commitments in question, the undertaking could reasonably have foreseen, having regard to the provisions of this Directive, that serious difficulties were likely to arise;
- (h) the level of connection of the system with other systems and the degree of interoperability of those systems; and
- (i) the effects the granting of a derogation would have on the correct application of this Directive as regards the smooth functioning of the internal market in natural gas.

A decision on a request for a derogation concerning take-or-pay contracts concluded **before 1 July 2006** should not lead to a situation in which it is impossible to find economically viable alternative outlets. Serious difficulties shall in any case be deemed not to exist when the sales of natural gas do not fall below the level of minimum offtake guarantees contained in gas-purchase take-or-pay contracts or in so far as the relevant gas-purchase take-or-pay contract can be adapted or the natural gas undertaking is able to find alternative outlets.

4. Natural gas undertakings which have not been granted a derogation as referred to in paragraph 1 of this Article shall not refuse, or shall no longer refuse, access to the system because of take-or-pay commitments accepted in a gas purchase contract. **Contracting Parties** shall ensure that the relevant provisions of Articles 32 to 44 are complied with.

5. Any derogation granted under the above provisions shall be duly substantiated. The **Energy Community Secretariat** shall publish the decision **in a dedicated section of the website of the Energy Community**.

6. <...>

#### **Article 49**

#### **Emergent and isolated markets**

<...>

**Article 50****Review procedure**

&lt;...&gt;

**Article 51****Committee**

&lt;...&gt;

**Article 52<sup>11</sup>****Reporting**

1. The Secretariat shall monitor and review application of this Decision in the Contracting Parties.

2. The Secretariat shall submit an overall progress report to the Ministerial Council for the first time by 30 June 2012, and thereafter on an annual basis. The progress report shall reflect the progress made on creating a complete and fully operational internal market in electricity and gas and the obstacles that remain in this respect, including aspects of market dominance, market concentration, predatory or anti-competitive behaviour and the effect thereof in terms of market distortion. It shall in particular consider:

- the implementation by each Contracting Party of the provisions on unbundling, certification and on independence of the national regulatory authorities and application of these provisions in practice,
- the existence of non-discriminatory network access,
- effective regulation,
- the development of interconnection infrastructure and the security of supply situation in the Energy Community,
- the extent to which the full benefits of the opening of markets are accruing to small enterprises and household customers, notably with respect to public service and universal service standards,
- the extent to which markets are in practice open to effective competition, including aspects of market dominance, market concentration and predatory or anti-competitive behaviour,
- the extent to which customers are actually switching suppliers and renegotiating tariffs,
- price developments, including supply prices, in relation to the degree of opening of the markets, and
- the experience gained from application of this Decision as far as effective independence of system operators in vertically integrated undertakings is concerned and whether other measures in addition to functional independence and separation of accounts have been developed which have effects equivalent to legal unbundling.

<sup>11</sup> The text displayed here corresponds to Article 31 of Decision 2011/02/MC-EnC.

**3. The Secretariat shall present a report to the Ministerial Council for the first time by 30 June 2012, and thereafter on an annual basis, summarising the opinions issued by the Secretariat in application of the acts referred to in Article 1, as adapted by this Decision.**

***Article 53***

**Repeal**

<...>

***Article 54***<sup>12</sup>

**Implementation of the energy acquis**

**1. Each Contracting Party shall bring into force the laws, regulations and administrative provisions necessary to comply with <...> Directive 2009/73/EC, <...> and Regulation (EC) No 715/2009, as adapted by this Decision, by 1 January 2015.<sup>13</sup> They shall forthwith inform the Energy Community Secretariat thereof.**

**The Contracting Parties shall apply the measures referred to in the previous paragraph with effect from 1 January 2015 with the following exceptions:**

– <...>;

– Article 11 of Directive 2009/73/EC, which they shall apply from 1 January 2017.

**2. The Contracting Parties shall communicate to the Energy Community Secretariat the text of the main provisions of national law which they adopt in the field covered by this Decision.**

***Articles 55 and 56***<sup>14</sup>

**Entry into force and Addressees**

**This Decision [2011/02/MC-EnC] enters into force upon its adoption and is addressed to the Contracting Parties.**

## ANNEX I

### MEASURES ON CONSUMER PROTECTION

#### 1. Without prejudice to Energy Community rules on consumer protection <...> the measures referred to in Article 3 are to ensure that customers:

(a) have a right to a contract with their gas service provider that specifies:

- the identity and address of the supplier,
- the services provided, the service quality levels offered, as well as the time for the initial connection,
- the types of maintenance service offered,
- the means by which up-to-date information on all applicable tariffs and maintenance charges may be obtained,
- the duration of the contract, the conditions for renewal and termination of services and of the contract, and whether withdrawal from the contract without charge is permitted,
- any compensation and the refund arrangements which apply if contracted service quality levels are not met including inaccurate and delayed billing,
- the method of initiating procedures for settlement of disputes in accordance with point (f); and,
- information relating to consumer rights, including on the complaint handling and all of the information referred to in this point, clearly communicated through billing or the natural gas undertaking's web site,

Conditions shall be fair and well-known in advance. In any event, that information should be provided prior to the conclusion or confirmation of the contract. Where contracts are concluded through intermediaries, the information relating to the matters set out in this point shall also be provided prior to the conclusion of the contract;

(b) are given adequate notice of any intention to modify contractual conditions and are informed about their right of withdrawal when the notice is given. Service providers shall notify their subscribers directly of any increase in charges, at an appropriate time no later than one normal billing period after the increase comes into effect in a transparent and comprehensible manner. **Contracting Parties** shall ensure that customers are free to withdraw from contracts if they do not accept the new conditions notified to them by their gas service provider;

(c) receive transparent information on applicable prices and tariffs and on standard terms and conditions, in respect of access to and use of gas services;

(d) are offered a wide choice of payment methods, which do not unduly discriminate between customers. Prepayment systems shall be fair and adequately reflect likely consumption. Any difference in terms and conditions shall reflect the costs to the supplier of the different payment systems. General terms and conditions shall be fair and transparent. They shall be given in clear and comprehensible language and shall not include non-contractual barriers to the exercise of customers' rights, for example excessive contractual documentation. Customers shall be protected against unfair or misleading selling methods;

(e) are not charged for changing supplier;

(f) benefit from transparent, simple and inexpensive procedures for dealing with their complaints. In

particular, all consumers shall have the right to a good standard of service and complaint handling by their gas service provider. Such out-of-court dispute settlements procedures shall enable disputes to be settled fairly and promptly, preferably within three months, with provision, where warranted, for a system of reimbursement and/or compensation. They should, wherever possible, be in line with the principles set out in Commission Recommendation 98/257/EC of 30 March 1998 on the principles applicable to the bodies responsible for out-of-court settlement of consumer disputes;

(g) connected to the gas system are informed about their rights to be supplied, under the national legislation applicable, with natural gas of a specified quality at reasonable prices;

(h) have at their disposal their consumption data, and shall be able to, by explicit agreement and free of charge, give any registered supply undertaking access to its metering data. The party responsible for data management shall be obliged to give those data to the undertaking. **Contracting Parties** shall define a format for the data and a procedure for suppliers and consumers to have access to the data. No additional costs shall be charged to the consumer for that service;

(i) are properly informed of actual gas consumption and costs frequently enough to enable them to regulate their own gas consumption. That information shall be given by using a sufficient time frame, which takes account of the capability of customer's metering equipment. Due account shall be taken of the cost-efficiency of such measures. No additional costs shall be charged to the consumer for that service;

(j) receive a final closure account following any change of natural gas supplier no later than six weeks after the change of supplier has taken place.

2. **Contracting Parties** shall ensure the implementation of intelligent metering systems that shall assist the active participation of consumers in the gas supply market. The implementation of those metering systems may be subject to an economic assessment of all the long-term costs and benefits to the market and the individual consumer or which form of intelligent metering is economically reasonable and cost-effective and which timeframe is feasible for their distribution.

Such assessment shall take place by **1 January 2014**.

Subject to that assessment, **Contracting Parties** or any competent authority they designate, shall prepare a timetable for the implementation of intelligent metering systems.

The **Contracting Parties** or any competent authority they designate, shall ensure the interoperability of those metering systems to be implemented within their territories and shall have due regard to the use of appropriate standards and best practice and the importance of the development of the internal market in natural gas.

## REGULATION (EC) 715/2009 of 13 July 2009 on conditions for access to the natural gas transmission networks and repealing Regulation (EC) 1775/2005

Incorporated and adapted by Permanent High Level Group Decision 2018/01/PHLG-EnC of 12 January 2018 and by Ministerial Council Decision 2011/02/MC-EnC of 6 October 2011 on the implementation of Directive 2009/72/EC, Directive 2009/73/EC, Regulation (EC) 714/2009 and Regulation (EC) 715/2009 and amending Articles 11 and 59 of the Energy Community Treaty.

*The adaptations made by by Permanent High Level Group Decision 2018/01/PHLG-EnC of 12 January 2018 and Ministerial Council Decision 2011/02/MC-EnC are highlighted in **bold and blue**.*

Whereas:

(1) The internal market in natural gas, which has been progressively implemented since 1999, aims to deliver real choice for all consumers in the Community, be they citizens or businesses, new business opportunities and more cross-border trade, so as to achieve efficiency gains, competitive prices and higher standards of service, and to contribute to security of supply and sustainability.

(2) Directive 2003/55/EC of the European Parliament and of the Council of 26 June 2003 concerning common rules for the internal market in natural gas and Regulation (EC) No 1775/2005 of the European Parliament and of the Council of 28 September 2005 on conditions for access to the natural gas transmission networks have made significant contributions towards the creation of such an internal market in natural gas.

(3) Experience gained in the implementation and monitoring of a first set of Guidelines for Good Practice, adopted by the European Gas Regulatory Forum (the Madrid Forum) in 2002, demonstrates that in order to ensure the full implementation of the rules set out in those guidelines in all Member States, and in order to provide a minimum guarantee of equal market access conditions in practice, it is necessary to provide for them to become legally enforceable.

(4) A second set of common rules entitled “the Second Guidelines for Good Practice” was adopted at the meeting of the Madrid Forum on 24 and 25 September 2003 and the purpose of this Regulation is to lay down, on the basis of those guidelines, basic principles and rules regarding network access and third party access services, congestion management, transparency, balancing and the trading of capacity rights.

(5) Directive 2009/73/EC of the European Parliament and of the Council of 13 July 2009 concerning common rules for the internal market in natural gas provides for the possibility of a combined transmission and distribution system operator. The rules set out in this Regulation do not therefore require modification of the organisation of national transmission and distribution systems that are consistent with the relevant provisions of that Directive.

(6) High-pressure pipelines linking up local distributors to the gas network which are not primarily used in the context of local distribution are included in the scope of this Regulation.

(7) It is necessary to specify the criteria according to which tariffs for access to the network are determined, in order to ensure that they fully comply with the principle of non-discrimination and the needs of a well-functioning internal market and take fully into account the need for system integrity and reflect the actual costs incurred, insofar as such costs correspond to those of an efficient and structurally comparable network operator and are transparent, whilst including appropriate return

on investments, and, where appropriate, taking account of the benchmarking of tariffs by the regulatory authorities.

(8) In calculating tariffs for access to networks, it is important to take account of the actual costs incurred, insofar as such costs correspond to those of an efficient and structurally comparable network operator, and are transparent, as well as of the need to provide appropriate return on investments and incentives to construct new infrastructure, including special regulatory treatment for new investments as provided for in Directive 2009/73/EC. In that respect, and in particular if effective pipeline-to-pipeline competition exists, the benchmarking of tariffs by the regulatory authorities will be a relevant consideration.

(9) The use of market-based arrangements, such as auctions, to determine tariffs has to be compatible with the provisions laid down in Directive 2009/73/EC.

(10) A common minimum set of third-party access services is necessary to provide a common minimum standard of access in practice throughout the Community, to ensure that third party access services are sufficiently compatible and to allow the benefits accruing from a well-functioning internal market in natural gas to be exploited.

(11) At present, there are obstacles to the sale of gas on equal terms, without discrimination or disadvantage in the Community. In particular, non-discriminatory network access and an equally effective level of regulatory supervision do not yet exist in each Member State, and isolated markets persist.

(12) A sufficient level of cross-border gas interconnection capacity should be achieved and market integration fostered in order to complete the internal market in natural gas.

(13) The Communication of the Commission of 10 January 2007 entitled "An Energy Policy for Europe" highlighted the importance of completing the internal market in natural gas and creating a level playing field for all natural gas undertakings in the Community. The Communications of the Commission of 10 January 2007 entitled "Prospects for the internal gas and electricity market" and "Inquiry pursuant to Article 17 of Regulation (EC) No 1/2003 into the European gas and electricity sectors (Final Report)" demonstrated that the present rules and measures neither provide the necessary framework nor provide for the creation of interconnection capacities to achieve the objective of a well-functioning, efficient and open internal market.

(14) In addition to thoroughly implementing the existing regulatory framework, the regulatory framework for the internal market in natural gas set out in Regulation (EC) No 1775/2005 should be adapted in line with those communications.

(15) In particular, increased cooperation and coordination among transmission system operators is required to create network codes for providing and managing effective and transparent access to the transmission networks across borders, and to ensure coordinated and sufficiently forward looking planning and sound technical evolution of the transmission system in the Community, including the creation of interconnection capacities, with due regard to the environment. The network codes should be in line with framework guidelines which are non-binding in nature (framework guidelines) and which are developed by the Agency for the Cooperation of Energy Regulators established by Regulation (EC) No 713/2009 of the European Parliament and of the Council of 13 July 2009 establishing an Agency for the Cooperation of Energy Regulators (the Agency). The Agency should have a role in reviewing, based on matters of fact, draft network codes, including their compliance with the framework guidelines, and it should be enabled to recommend them for adoption by the

Commission. The Agency should assess proposed amendments to the network codes and it should be enabled to recommend them for adoption by the Commission. Transmission system operators should operate their networks in accordance with those network codes.

(16) In order to ensure optimal management of the gas transmission network in the Community a European Network of Transmission System Operators for Gas (the ENTSO for Gas), should be established. The tasks of the ENTSO for Gas should be carried out in compliance with Community competition rules which remain applicable to the decisions of the ENTSO for Gas. The tasks of the ENTSO for Gas should be well-defined and its working method should ensure efficiency, transparency and the representative nature of the ENTSO for Gas. The network codes prepared by the ENTSO for Gas are not intended to replace the necessary national network codes for non cross-border issues. Given that more effective progress may be achieved through an approach at regional level, transmission system operators should set up regional structures within the overall cooperation structure, whilst ensuring that results at regional level are compatible with network codes and non-binding ten-year network development plans at Community level. Cooperation within such regional structures presupposes effective unbundling of network activities from production and supply activities. In the absence of such unbundling, regional cooperation between transmission system operators gives rise to a risk of anti-competitive conduct. Member States should promote cooperation and monitor the effectiveness of the network operations at regional level. Cooperation at regional level should be compatible with progress towards a competitive and efficient internal market in gas.

(17) All market participants have an interest in the work expected of the ENTSO for Gas. An effective consultation process is therefore essential and existing structures set up to facilitate and streamline the consultation process, such as the European Association for the Streamlining of Energy Exchange, national regulators or the Agency should play an important role.

(18) In order to ensure greater transparency regarding the development of the gas transmission network in the Community, the ENTSO for Gas should draw up, publish and regularly update a non-binding Community-wide ten-year network development plan (Community-wide network development plan). Viable gas transmission networks and necessary regional interconnections, relevant from a commercial or security of supply point of view, should be included in that network development plan.

(19) To enhance competition through liquid wholesale markets for gas, it is vital that gas can be traded independently of its location in the system. The only way to do this is to give network users the freedom to book entry and exit capacity independently, thereby creating gas transport through zones instead of along contractual paths. The preference for entry-exit systems to facilitate the development of competition was already expressed by most stakeholders at the 6th Madrid Forum on 30 and 31 October 2002. Tariffs should not be dependent on the transport route. The tariff set for one or more entry points should therefore not be related to the tariff set for one or more exit points, and *vice versa*.

(20) References to harmonised transport contracts in the context of non-discriminatory access to the network of transmission system operators do not mean that the terms and conditions of the transport contracts of a particular system operator in a Member State must be the same as those of another transmission system operator in that Member State or in another Member State, unless minimum requirements are set which must be met by all transport contracts.

(21) There is substantial contractual congestion in the gas networks. The congestion-management

and capacity-allocation principles for new or newly negotiated contracts are therefore based on the freeing-up of unused capacity by enabling network users to sublet or resell their contracted capacities and the obligation of transmission system operators to offer unused capacity to the market, at least on a day-ahead and interruptible basis. Given the large proportion of existing contracts and the need to create a true level playing field between users of new and existing capacity, those principles should be applied to all contracted capacity, including existing contracts.

(22) Although physical congestion of networks is, at present, rarely a problem in the Community, it may become one in the future. It is important, therefore, to provide the basic principle for the allocation of congested capacity in such circumstances.

(23) Market monitoring undertaken over recent years by the national regulatory authorities and by the Commission has shown that current transparency requirements and rules on access to infrastructure are not sufficient to secure a genuine, well-functioning, open and efficient internal market in gas.

(24) Equal access to information on the physical status and efficiency of the system is necessary to enable all market participants to assess the overall demand and supply situation and to identify the reasons for movements in the wholesale price. This includes more precise information on supply and demand, network capacity, flows and maintenance, balancing and availability and usage of storage. The importance of that information for the functioning of the market requires alleviating existing limitations to publication for confidentiality reasons.

(25) Confidentiality requirements for commercially sensitive information are, however, particularly relevant where data of a commercially strategic nature for the company are concerned, where there is only one single user for a storage facility, or where data are concerned regarding exit points within a system or subsystem that is not connected to another transmission or distribution system but to a single industrial final customer, where the publication of such data would reveal confidential information as to the production process of that customer.

(26) To enhance trust in the market, its participants need to be sure that those engaging in abusive behaviour can be subjected to effective, proportionate and dissuasive penalties. The competent authorities should be given the competence to investigate effectively allegations of market abuse. To that end, it is necessary that competent authorities have access to data that provides information on operational decisions made by supply undertakings. In the gas market, all those decisions are communicated to the system operators in the form of capacity reservations, nominations and realised flows. System operators should keep information in relation thereto available to and easily accessible by the competent authorities for a fixed period of time. The competent authorities should, furthermore, regularly monitor the compliance of the transmission system operators with the rules.

(27) Access to gas storage facilities and liquefied natural gas (LNG) facilities is insufficient in some Member States, and therefore the implementation of the existing rules needs to be improved. Monitoring by the European Regulators' Group for Electricity and Gas concluded that the voluntary guidelines for good third-party access practice for storage system operators, agreed by all stakeholders at the Madrid Forum, are being insufficiently applied and therefore need to be made binding.

(28) Non-discriminatory and transparent balancing systems for gas, operated by transmission system operators, are important mechanisms, particularly for new market entrants which may have more difficulty balancing their overall sales portfolio than companies already established within a relevant market. It is therefore necessary to lay down rules to ensure that transmission system operators op-

erate such mechanisms in a manner compatible with non-discriminatory, transparent and effective access conditions to the network.

(29) The trading of primary capacity rights is an important part of developing a competitive market and creating liquidity. This Regulation should therefore lay down basic rules relating to such trading.

(30) National regulatory authorities should ensure compliance with the rules contained in this Regulation and the Guidelines adopted pursuant thereto.

(31) In the Guidelines annexed to this Regulation, specific detailed implementing rules are defined on the basis of the Second Guidelines for Good Practice. Where appropriate, those rules will evolve over time, taking into account the differences of national gas systems.

(32) When proposing to amend the Guidelines annexed to this Regulation, the Commission should ensure prior consultation of all relevant parties concerned with the Guidelines, represented by the professional organisations, and of the Member States within the Madrid Forum.

(33) The Member States and the competent national authorities should be required to provide relevant information to the Commission. Such information should be treated confidentially by the Commission.

(34) This Regulation and the Guidelines adopted in accordance with it are without prejudice to the application of the Community rules on competition.

(35) The measures necessary for the implementation of this Regulation should be adopted in accordance with Council Decision 1999/468/EC of 28 June 1999 laying down the procedures for the exercise of implementing powers conferred on the Commission.

(36) In particular, the Commission should be empowered to establish or adopt the Guidelines necessary for providing the minimum degree of harmonisation required to achieve the aims of this Regulation. Since those measures are of general scope and are designed to amend non-essential elements of this Regulation, *inter alia* by supplementing it with new non-essential elements, they must be adopted in accordance with the regulatory procedure with scrutiny provided for in Article 5a of Decision 1999/468/EC.

(37) Since the objective of this Regulation, namely the setting of fair rules for access conditions to natural gas transmission networks, storage and LNG facilities cannot be sufficiently achieved by the Member States and can therefore be better achieved at Community level, the Community may adopt measures, in accordance with the principle of subsidiarity, as set out in Article 5 of the Treaty. In accordance with the principle of proportionality, as set out in that Article, this Regulation does not go beyond what is necessary in order to achieve that objective.

(38) Given the scope of the amendments that are being made herein to Regulation (EC) No 1775/2005, it is desirable, for reasons of clarity and rationalisation, that the provisions in question should be recast by bringing them all together in a single text in a new Regulation.

## **Article 1**

### **Subject matter and scope**

This Regulation aims at:

- (a) setting non-discriminatory rules for access conditions to natural gas transmission systems taking into account the special characteristics of national and regional markets with a view to ensuring the proper functioning of the internal market in gas;
- (b) setting non-discriminatory rules for access conditions to LNG facilities and storage facilities taking into account the special characteristics of national and regional markets; and
- (c) facilitating the emergence of a well-functioning and transparent wholesale market with a high level of security of supply in gas and providing mechanisms to harmonise the network access rules for cross-border exchanges in gas.

The objectives referred to in the first subparagraph shall include the setting of harmonised principles for tariffs, or the methodologies underlying their calculation, for access to the network, but not to storage facilities, the establishment of third-party access services and harmonised principles for capacity-allocation and congestion-management, the determination of transparency requirements, balancing rules and imbalance charges, and the facilitation of capacity trading.

This Regulation, with the exception of Article 19(4), shall apply only to storage facilities falling under Article 33(3) or (4) of Directive 2009/73/EC.

The **Contracting Parties** may establish an entity or body set up in compliance with Directive 2009/73/EC for the purpose of carrying out one or more functions typically attributed to the transmission system operator, which shall be subject to the requirements of this Regulation. That entity or body shall be subject to certification in accordance with Article 3 of this Regulation and shall be subject to designation in accordance with Article 10 of Directive 2009/73/EC.

## **Article 2**

### **Definitions**

1. For the purpose of this Regulation, the following definitions apply:

- (1) “transmission” means the transport of natural gas through a network, which mainly contains high-pressure pipelines, other than an upstream pipeline network and other than the part of high-pressure pipelines primarily used in the context of local distribution of natural gas, with a view to its delivery to customers, but not including supply;
- (2) “transport contract” means a contract which the transmission system operator has concluded with a network user with a view to carrying out transmission;
- (3) “capacity” means the maximum flow, expressed in normal cubic meters per time unit or in energy unit per time unit, to which the network user is entitled in accordance with the provisions of the transport contract;
- (4) “unused capacity” means firm capacity which a network user has acquired under a transport contract but which that user has not nominated by the deadline specified in the contract;

- (5) “congestion management” means management of the capacity portfolio of the transmission system operator with a view to optimal and maximum use of the technical capacity and the timely detection of future congestion and saturation points;
- (6) “secondary market” means the market of the capacity traded otherwise than on the primary market;
- (7) “nomination” means the prior reporting by the network user to the transmission system operator of the actual flow that the network user wishes to inject into or withdraw from the system;
- (8) “re-nomination” means the subsequent reporting of a corrected nomination;
- (9) “system integrity” means any situation in respect of a transmission network including necessary transmission facilities in which the pressure and the quality of the natural gas remain within the minimum and maximum limits laid down by the transmission system operator, so that the transmission of natural gas is guaranteed from a technical standpoint;
- (10) “balancing period” means the period within which the off-take of an amount of natural gas, expressed in units of energy, must be offset by every network user by means of the injection of the same amount of natural gas into the transmission network in accordance with the transport contract or the network code;
- (11) “network user” means a customer or a potential customer of a transmission system operator, and transmission system operators themselves in so far as it is necessary for them to carry out their functions in relation to transmission;
- (12) “interruptible services” means services offered by the transmission system operator in relation to interruptible capacity;
- (13) “interruptible capacity” means gas transmission capacity that may be interrupted by the transmission system operator in accordance with the conditions stipulated in the transport contract;
- (14) “long-term services” means services offered by the transmission system operator with a duration of one year or more;
- (15) “short-term services” means services offered by the transmission system operator with a duration of less than one year;
- (16) “firm capacity” means gas transmission capacity contractually guaranteed as uninterruptible by the transmission system operator;
- (17) “firm services” mean services offered by the transmission system operator in relation to firm capacity;
- (18) “technical capacity” means the maximum firm capacity that the transmission system operator can offer to the network users, taking account of system integrity and the operational requirements of the transmission network;
- (19) “contracted capacity” means capacity that the transmission system operator has allocated to a network user by means of a transport contract;
- (20) “available capacity” means the part of the technical capacity that is not allocated and is still available to the system at that moment;
- (21) “contractual congestion” means a situation where the level of firm capacity demand exceeds the technical capacity;
- (22) “primary market” means the market of the capacity traded directly by the transmission system

operator;

(23) “physical congestion” means a situation where the level of demand for actual deliveries exceeds the technical capacity at some point in time;

(24) “LNG facility capacity” means capacity at an LNG terminal for the liquefaction of natural gas or the importation, offloading, ancillary services, temporary storage and re-gasification of LNG;

(25) “space” means the volume of gas which a user of a storage facility is entitled to use for the storage of gas;

(26) “deliverability” means the rate at which the storage facility user is entitled to withdraw gas from the storage facility;

(27) “injectability” means the rate at which the storage facility user is entitled to inject gas into the storage facility;

(28) “storage capacity” means any combination of space, injectability and deliverability.

2. Without prejudice to the definitions in paragraph 1 of this Article, the definitions contained in Article 2 of Directive 2009/73/EC which are relevant for the application of this Regulation, also apply, with the exception of the definition of transmission in point 3 of that Article.

The definitions in points 3 to 23 of paragraph 1 of this Article in relation to transmission apply by analogy in relation to storage and LNG facilities.

### Article 3

#### Certification of transmission system operators

1. The **Energy Community Secretariat** shall examine any notification of a decision on the certification of a transmission system operator as laid down in Article 10(6) of Directive 2009/73/EC as soon as it is received. Within **four months** of the day of receipt of such notification, the **Energy Community Secretariat** shall deliver its opinion to the relevant national regulatory authority in regard to its compatibility with Article 10(2) or Article 11, and Article 9 of Directive 2009/73/EC.

**When preparing the opinion referred to in the first subparagraph, the Energy Community Secretariat shall request the Energy Community Regulatory Board to provide its opinion on the national regulatory authority’s decision.**

In the absence of an opinion by the **Energy Community Secretariat** within the periods referred to in the first subparagraph, the **Energy Community Secretariat** shall be deemed not to raise objections against the regulatory authority’s decision.

2. Within two months of receiving an opinion of the **Energy Community Secretariat**, the national regulatory authority shall adopt its final decision regarding the certification of the transmission system operator, taking the utmost account of that opinion. The regulatory authority’s decision and the **Energy Community Secretariat’s** opinion shall be published together.

3. At any time during the procedure regulatory authorities and/or the **Energy Community Secretariat** may request from a transmission system operator and/or an undertaking performing any of the functions of production or supply any information relevant to the fulfillment of their tasks under this Article.

4. Regulatory authorities and the **Energy Community Secretariat** shall preserve the confidentiality

of commercially sensitive information.

5. <...>

6. Where the **Energy Community Secretariat** has received notification of the certification of a transmission system operator under Article 9(10) of Directive 2009/73/EC, the **Secretariat shall issue an opinion** relating to certification. **The regulatory authority shall take the utmost account of that opinion. Where the final decision diverges from the Secretariat's opinion, the regulatory authority concerned shall provide and publish, together with that decision, the reasoning underlying its decision. Diverting decisions shall be included in the agenda of the first meeting of the Ministerial Council following the date of the decision, for information and discussion.**

**Regional cooperation of transmission system operators**

**Transmission system operators shall promote operational arrangements in order to ensure the optimum management of the Energy Community network and shall promote the development of energy exchanges, the coordinated allocation of cross-border capacity through non-discriminatory market-based solutions, paying due attention to the specific merits of implicit auctions for short-term allocations, and the integration of balancing and reserve power mechanisms.**

**Article 13**

**Tariffs for access to networks**

1. Tariffs, or the methodologies used to calculate them, applied by the transmission system operators and approved by the regulatory authorities pursuant to Article 41(6) of Directive 2009/73/EC, as well as tariffs published pursuant to Article 32(1) of that Directive, shall be transparent, take into account the need for system integrity and its improvement and reflect the actual costs incurred, insofar as such costs correspond to those of an efficient and structurally comparable network operator and are transparent, whilst including an appropriate return on investments, and, where appropriate, taking account of the benchmarking of tariffs by the regulatory authorities. Tariffs, or the methodologies used to calculate them, shall be applied in a non-discriminatory manner.

**Contracting Parties** may decide that tariffs may also be determined through market-based arrange-

---

<sup>3</sup> In accordance with Article 7(3) of Decision 2011/02/MC-EnC, Article 25 of that Decision is displayed here.

ments, such as auctions, provided that such arrangements and the revenues arising there from are approved by the regulatory authority.

Tariffs, or the methodologies used to calculate them, shall facilitate efficient gas trade and competition, while at the same time avoiding cross-subsidies between network users and providing incentives for investment and maintaining or creating interoperability for transmission networks.

Tariffs for network users shall be non-discriminatory and set separately for every entry point into or exit point out of the transmission system. Cost-allocation mechanisms and rate setting methodology regarding entry points and exit points shall be approved by the national regulatory authorities. By 3 September 2011, the **Contracting Parties** shall ensure that, after a transitional period, network charges shall not be calculated on the basis of contract paths.

2. Tariffs for network access shall neither restrict market liquidity nor distort trade across borders of different transmission systems. Where differences in tariff structures or balancing mechanisms would hamper trade across transmission systems, and notwithstanding Article 41(6) of Directive 2009/73/EC, transmission system operators shall, in close cooperation with the relevant national authorities, actively pursue convergence of tariff structures and charging principles, including in relation to balancing.

#### **Article 14**

##### **Third-party access services concerning transmission system operators**

1. Transmission system operators shall:

- (a) ensure that they offer services on a non-discriminatory basis to all network users;
- (b) provide both firm and interruptible third-party access services. The price of interruptible capacity shall reflect the probability of interruption;
- (c) offer to network users both long and short-term services.

In regard to point (a) of the first subparagraph, where a transmission system operator offers the same service to different customers, it shall do so under equivalent contractual terms and conditions, either using harmonised transport contracts or a common network code approved by the competent authority in accordance with the procedure laid down in Article 41 of Directive 2009/73/EC.

2. Transport contracts signed with non-standard start dates or with a shorter duration than a standard annual transport contract shall not result in arbitrarily higher or lower tariffs that do not reflect the market value of the service, in accordance with the principles laid down in Article 13(1).

3. Where appropriate, third-party access services may be granted subject to appropriate guarantees from network users with respect to the creditworthiness of such users. Such guarantees shall not constitute undue market-entry barriers and shall be non-discriminatory, transparent and proportionate.

### **Article 15**

#### **Third-party access services concerning storage and LNG facilities**

1. LNG and storage system operators shall:

(a) offer services on a non-discriminatory basis to all network users that accommodate market demand; in particular, where an LNG or storage system operator offers the same service to different customers, it shall do so under equivalent contractual terms and conditions;

(b) offer services that are compatible with the use of the interconnected gas transport systems and facilitate access through cooperation with the transmission system operator; and

(c) make relevant information public, in particular data on the use and availability of services, in a time-frame compatible with the LNG or storage facility users' reasonable commercial needs, subject to the monitoring of such publication by the national regulatory authority.

2. Each storage system operator shall:

(a) provide both firm and interruptible third-party access services; the price of interruptible capacity shall reflect the probability of interruption;

(b) offer to storage facility users both long and short-term services; and

(c) offer to storage facility users both bundled and unbundled services of storage space, injectability and deliverability.

3. LNG and storage facility contracts shall not result in arbitrarily higher tariffs in cases in which they are signed:

(a) outside a natural gas year with non-standard start dates; or

(b) with a shorter duration than a standard LNG and storage facility contract on an annual basis.

5. Contractual limits on the required minimum size of LNG facility capacity and storage capacity shall be justified on the basis of technical constraints and shall permit smaller storage users to gain access to storage services.

4. Where appropriate, third-party access services may be granted subject to appropriate guarantees from network users with respect to the creditworthiness of such users. Such guarantees shall not constitute undue market-entry barriers and shall be non-discriminatory, transparent and proportionate.

### **Article 16**

#### **Principles of capacity-allocation mechanisms and congestion-management procedures concerning transmission system operators**

1. The maximum capacity at all relevant points referred to in Article 18(3) shall be made available to market participants, taking into account system integrity and efficient network operation.

2. The transmission system operator shall implement and publish non-discriminatory and transparent capacity-allocation mechanisms, which shall:

(a) provide appropriate economic signals for the efficient and maximum use of technical capacity, facilitate investment in new infrastructure and facilitate cross-border exchanges in natural gas;

(b) be compatible with the market mechanisms including spot markets and trading hubs, while being flexible and capable of adapting to evolving market circumstances; and

(c) be compatible with the network access systems of the **Contracting Parties**.

3. The transmission system operator shall implement and publish non-discriminatory and transparent congestion-management procedures which facilitate cross-border exchanges in natural gas on a non-discriminatory basis and which shall be based on the following principles:

(a) in the event of contractual congestion, the transmission system operator shall offer unused capacity on the primary market at least on a day-ahead and interruptible basis; and

(b) network users who wish to re-sell or sublet their unused contracted capacity on the secondary market shall be entitled to do so.

In regard to point (b) of the first subparagraph, a **Contracting Party** may require notification or information of the transmission system operator by network users.

4. In the event that physical congestion exists, non-discriminatory, transparent capacity-allocation mechanisms shall be applied by the transmission system operator or, as appropriate, by the regulatory authorities.

5. Transmission system operators shall regularly assess market demand for new investment. When planning new investments, transmission system operators shall assess market demand and take into account security of supply.

### **Article 17**

#### **Principles of capacity-allocation mechanisms and congestion-management procedures concerning storage and LNG facilities**

1. The maximum storage and LNG facility capacity shall be made available to market participants, taking into account system integrity and operation.

2. LNG and storage system operators shall implement and publish non-discriminatory and transparent capacity-allocation mechanisms which shall:

(a) provide appropriate economic signals for the efficient and maximum use of capacity and facilitate investment in new infrastructure;

(b) be compatible with the market mechanism including spot markets and trading hubs, while being flexible and capable of adapting to evolving market circumstances; and

(c) be compatible with the connected network access systems.

3. LNG and storage facility contracts shall include measures to prevent capacity-hoarding, by taking into account the following principles, which shall apply in cases of contractual congestion:

(a) the system operator must offer unused LNG facility and storage capacity on the primary market without delay; for storage facilities this must be at least on a day-ahead and interruptible basis;

(b) LNG and storage facility users who wish to re-sell their contracted capacity on the secondary market must be entitled to do so.

### **Article 18**

#### **Transparency requirements concerning transmission system operators**

1. The transmission system operator shall make public detailed information regarding the services it offers and the relevant conditions applied, together with the technical information necessary for network users to gain effective network access.
2. In order to ensure transparent, objective and non-discriminatory tariffs and facilitate efficient utilisation of the gas network, transmission system operators or relevant national authorities shall publish reasonably and sufficiently detailed information on tariff derivation, methodology and structure.
3. For the services provided, each transmission system operator shall make public information on technical, contracted and available capacities on a numerical basis for all relevant points including entry and exit points on a regular and rolling basis and in a user-friendly and standardised manner.
4. The relevant points of a transmission system on which the information is to be made public shall be approved by the competent authorities after consultation with network users.
5. The transmission system operator shall always disclose the information required by this Regulation in a meaningful, quantifiably clear and easily accessible manner and on a non-discriminatory basis.
6. The transmission system operator shall make public *ex-ante* and *ex-post* supply and demand information, based on nominations, forecasts and realised flows in and out of the system. The national regulatory authority shall ensure that all such information is made public. The level of detail of the information that is made public shall reflect the information available to the transmission system operator.

The transmission system operator shall make public measures taken as well as costs incurred and revenue generated to balance the system.

The market participants concerned shall provide the transmission system operator with the data referred to in this Article.

### **Article 19**

#### **Transparency requirements concerning storage facilities and LNG facilities**

1. LNG and storage system operators shall make public detailed information regarding the services it offers and the relevant conditions applied, together with the technical information necessary for LNG and storage facility users to gain effective access to the LNG and storage facilities.
2. For the services provided, LNG and storage system operators shall make public information on contracted and available storage and LNG facility capacities on a numerical basis on a regular and rolling basis and in a user-friendly standardised manner.
3. LNG and storage system operators shall always disclose the information required by this Regulation in a meaningful, quantifiably clear and easily accessible way and on a non-discriminatory basis.
4. LNG and storage system operators shall make public the amount of gas in each storage or LNG facility, or group of storage facilities if that corresponds to the way in which the access is offered to system users, inflows and outflows, and the available storage and LNG facility capacities, including for those facilities exempted from third-party access. That information shall also be communicated

to the transmission system operator, which shall make it public on an aggregated level per system or subsystem defined by the relevant points. The information shall be updated at least daily.

In cases in which a storage system user is the only user of a storage facility, the storage system user may submit to the national regulatory authority a reasoned request for confidential treatment of the data referred to in the first subparagraph. Where the national regulatory authority comes to the conclusion that such a request is justified, taking into account, in particular, the need to balance the interest of legitimate protection of business secrets, the disclosure of which would negatively affect the overall commercial strategy of the storage user, with the objective of creating a competitive internal gas market, it may allow the storage system operator not to make public the data referred to in the first subparagraph, for a duration of up to one year.

The second subparagraph shall apply without prejudice to the obligations of communication to and publication by the transmission system operator referred to in the first subparagraph, unless the aggregated data are identical to the individual storage system data for which the national regulatory authority has approved non-publication.

5. In order to ensure transparent, objective and non-discriminatory tariffs and facilitate efficient utilisation of the infrastructures, the LNG and storage facility operators or relevant regulatory authorities shall make public sufficiently detailed information on tariff derivation, the methodologies and the structure of tariffs for infrastructure under regulated third-party access.

### **Article 20**

#### **Record keeping by system operators**

Transmission system operators, storage system operators and LNG system operators shall keep at the disposal of the national authorities, including the national regulatory authority, the national competition authority and of the **Energy Community Secretariat**, all information referred to in Articles 18 and 19, and in Part 3 of Annex I for a period of five years.

### **Article 21**

#### **Balancing rules and imbalance charges**

1. Balancing rules shall be designed in a fair, non-discriminatory and transparent manner and shall be based on objective criteria. Balancing rules shall reflect genuine system needs taking into account the resources available to the transmission system operator. Balancing rules shall be market-based.

2. In order to enable network users to take timely corrective action, the transmission system operator shall provide sufficient, well-timed and reliable on-line based information on the balancing status of network users.

The information provided shall reflect the level of information available to the transmission system operator and the settlement period for which imbalance charges are calculated.

No charge shall be made for the provision of information under this paragraph.

3. Imbalance charges shall be cost-reflective to the extent possible, whilst providing appropriate incentives on network users to balance their input and off-take of gas. They shall avoid cross-subsidi-

sation between network users and shall not hamper the entry of new market entrants.

Any calculation methodology for imbalance charges as well as the final tariffs shall be made public by the competent authorities or the transmission system operator, as appropriate.

4. **Contracting Parties** shall ensure that transmission system operators endeavour to harmonise balancing regimes and streamline structures and levels of balancing charges in order to facilitate gas trade.

### **Article 22**

#### **Trading of capacity rights**

Each transmission, storage and LNG system operator shall take reasonable steps to allow capacity rights to be freely tradable and to facilitate such trade in a transparent and non-discriminatory manner. Every such operator shall develop harmonised transport, LNG facility and storage contracts and procedures on the primary market to facilitate secondary trade of capacity and shall recognise the transfer of primary capacity rights where notified by system users.

The harmonised transport, LNG facility and storage contracts and procedures shall be notified to the regulatory authorities.

### **Article 23**

#### **Guidelines<sup>4</sup>**

**1. The Energy Community shall endeavour to apply the Guidelines adopted by the European Commission under <...> Regulation (EC) No 715/2009.**

**2. These Guidelines, which may need to be adapted to the institutional framework of the Energy Community, shall be adopted by the Permanent High Level Group, following the procedure laid down in Article 79 of the Treaty.**

**3. The Permanent High Level Group shall adopt a Procedural Act on application of this article.<sup>5</sup>**

### **Article 24**

#### **Regulatory authorities**

When carrying out their responsibilities under this Regulation, the regulatory authorities shall ensure compliance with this Regulation and the Guidelines adopted pursuant to Article 18.<sup>6</sup>

Where appropriate, they shall cooperate with each other, **with the Energy Community Secretariat and the Energy Community Regulatory Board** in compliance with Chapter VIII of Directive

---

<sup>4</sup> The text displayed here corresponds to Article 27 of Decision 2011/02/MC-EnC.

<sup>5</sup> Procedural Act 01/2012/PHLG-EnC of Permanent High Level Group of 21 June 2012 laying down the rules governing the adoption of Guidelines and Network Codes in the Energy Community was adopted on 21 June 2012.

<sup>6</sup> As adopted by the Permanent High Level Group under Procedural Act 01/2012/PHLG-EnC.

2009/73/EC.

### **Article 25**

#### **Provision of information**

**Contracting Parties** and the regulatory authorities shall, on request, provide to the **Energy Community Secretariat** all information necessary for the purposes of Article 23.<sup>7</sup>

The **Energy Community Secretariat** shall set a reasonable time limit within which the information is to be provided, taking into account the complexity of the information required and the urgency with which the information is needed.

### **Article 26**

#### **Right of Contracting Parties to provide for more detailed measures**

This Regulation shall be without prejudice to the rights of **Contracting Parties** to maintain or introduce measures that contain more detailed provisions than those set out herein or in the Guidelines referred to in Article 23.<sup>8</sup>

### **Article 27**

#### **Penalties<sup>9</sup>**

**1. Contracting Parties shall lay down rules on penalties applicable to infringements of the provisions of this Regulation and shall take all measures necessary to ensure that those provisions are implemented. The penalties provided for must be effective, proportionate and dissuasive. Contracting Parties shall notify these provisions to the Secretariat by 1 January 2015 and shall notify the Secretariat without delay of any subsequent amendment affecting them.**

2. Penalties provided for pursuant to paragraph 1 shall not be of a criminal law nature.

### **Article 28**

#### **Committee procedure**

<...>

<sup>7</sup> As adopted by the Permanent High Level Group under Procedural Act 01/2012/PHLG-EnC.

<sup>8</sup> *ibid.*

<sup>9</sup> As adapted by Article 19 of Decision 2011/02/MC-EnC.

## **Article 29**

### **Secretariat report<sup>10</sup>**

**1. The Secretariat shall monitor and review application of this Decision in the Contracting Parties.**

**2. The Secretariat shall submit an overall progress report to the Ministerial Council for the first time by 30 June 2012, and thereafter on an annual basis. The progress report shall reflect the progress made on creating a complete and fully operational internal market in electricity and gas and the obstacles that remain in this respect, including aspects of market dominance, market concentration, predatory or anti-competitive behaviour and the effect thereof in terms of market distortion. It shall in particular consider:**

- the implementation by each Contracting Party of the provisions on unbundling, certification and on independence of the national regulatory authorities and application of these provisions in practice,**
- the existence of non-discriminatory network access,**
- effective regulation,**
- the development of interconnection infrastructure and the security of supply situation in the Energy Community,**
- the extent to which the full benefits of the opening of markets are accruing to small enterprises and household customers, notably with respect to public service and universal service standards,**
- the extent to which markets are in practice open to effective competition, including aspects of market dominance, market concentration and predatory or anti-competitive behaviour,**
- the extent to which customers are actually switching suppliers and renegotiating tariffs,**
- price developments, including supply prices, in relation to the degree of opening of the markets, and**
- the experience gained from application of this Decision as far as effective independence of system operators in vertically integrated undertakings is concerned and whether other measures in addition to functional independence and separation of accounts have been developed which have effects equivalent to legal unbundling.**

**3. The Secretariat shall present a report to the Ministerial Council for the first time by 30 June 2012, and thereafter on an annual basis, summarising the opinions issued by the Secretariat in application of the acts referred to in Article 1, as adapted by this Decision.**

---

<sup>10</sup> The text displayed here corresponds to Article 31 of Decision 2011/02/MC-EnC.

**Article 30****Derogations and exemptions**

This Regulation shall not apply to:

(a) <...><sup>11</sup>

(b) major new infrastructure, i.e. interconnectors, LNG and storage facilities, and significant increases of capacity in existing infrastructure and modifications of such infrastructure which enable the development of new sources of gas supply referred to in Article 36(1) and (2) of Directive 2009/73/EC which are exempt from the provisions of Articles 9, 14, 32, 33, 34 or Article 41(6), (8) and (10) of that Directive as long as they are exempt from the provisions referred to in this subparagraph, with the exception of Article 19(4) of this Regulation; or

(c) natural gas transmission systems which have been granted derogations under Article 48 of Directive 2009/73/EC.

<...><sup>12</sup>

**Article 31****Repeal**

<...>

**Article 32<sup>13</sup>****Entry into force**

**This Decision [2011/02/MC-EnC] enters into force upon its adoption and is addressed to the Contracting Parties.**

**Article 3 of Decision 2011/02/MC-EnC**

**Each Contracting Party shall bring into force the laws, regulations and administrative provisions necessary to comply with <...> Regulation (EC) 715/2009, as adapted by this Decision, by 1 January 2015.<sup>14</sup> They shall forthwith inform the Energy Community Secretariat thereof.**

<...>

**The Contracting Parties shall communicate to the Energy Community Secretariat the text of the main provisions of national law which they adopt in the field covered by this Decision.**

<sup>11</sup> Not applicable in accordance with Article 24(4) of Decision 2011/02/MC-EnC.

<sup>12</sup> *ibid.*

<sup>13</sup> The text displayed here corresponds to Article 32 of Decision 2011/02/MC-EnC.

<sup>14</sup> In accordance with the Accession Protocol, the corresponding date for Georgia, is 31 December 2020.

## **ANNEX I TO REGULATION (EC) NO 715/2009 ON CONDITIONS FOR ACCESS TO THE NATURAL GAS TRANSMISSION NETWORKS AS AMENDED BY COMMISSION DECISION (EU) 2012/490 OF 24 AUGUST 2012 AND COMMISSION DECISION (EU) 2015/715 OF 30 APRIL 2015**

Incorporated and adapted by Ministerial Council Decision 2011/02/MC-EnC of 6 October 2011 and Permanent High Level Group Decision 2018/01/PHLG-EnC of 12 January 2018

Amendments to Annex I to Regulation (EC) 715/2009 incorporated by Permanent High Level Group Decision 2018/01/PHLG-EnC are highlighted in **bold**. The adaptations made to Annex I to Regulation (EC) 715/2009 by Decision 2018/01/PHLG-EnC are highlighted in **bold and blue**.<sup>15</sup>

### GUIDELINES ON

#### 1. THIRD-PARTY ACCESS SERVICES CONCERNING TRANSMISSION SYSTEM OPERATORS

1. Transmission system operators shall offer firm and interruptible services down to a minimum period of one day.
2. Harmonised transport contracts and common network codes shall be designed in a manner that facilitates trading and re-utilisation of capacity contracted by network users without hampering capacity release.
3. Transmission system operators shall develop network codes and harmonised contracts following proper consultation with network users.
4. Transmission system operators shall implement standardised nomination and re-nomination procedures. They shall develop information systems and electronic communication means to provide adequate data to network users and to simplify transactions, such as nominations, capacity contracting and transfer of capacity rights between network users.
5. Transmission system operators shall harmonise formalised request procedures and response times according to best industry practice with the aim of minimising response times. They shall provide for online screen-based capacity booking and confirmation systems and nomination and re-nomination procedures no later than 1 January 2010 after consultation with the relevant network users.
6. Transmission system operators shall not separately charge network users for information requests and transactions associated with their transport contracts and which are carried out according to standard rules and procedures.
7. Information requests that require extraordinary or excessive expenses such as feasibility studies may be charged separately, provided the charges can be duly substantiated.
8. Transmission system operators shall cooperate with other transmission system operators in coordinating the maintenance of their respective networks in order to minimise any disruption of transmission services to network users and transmission system operators in other areas and in order to ensure equal benefits with respect to security of supply including in relation to transit.

<sup>15</sup> According to Article 1(1) of Decision 2018/01/PHLG-EnC each Contracting Party shall transpose the amendments into national legislation no later than 1 October 2018.

9. Transmission system operators shall publish at least annually, by a predetermined deadline, all planned maintenance periods that might affect network users' rights from transport contracts and corresponding operational information with adequate advance notice. This shall include publishing on a prompt and non-discriminatory basis any changes to planned maintenance periods and notification of unplanned maintenance, as soon as that information becomes available to the transmission system operator. During maintenance periods, transmission system operators shall publish regularly updated information on the details of and expected duration and effect of the maintenance.

10. Transmission system operators shall maintain and make available to the competent authority upon request a daily log of the actual maintenance and flow disruptions that have occurred. Information shall also be made available on request to those affected by any disruption.

## 2. PRINCIPLES OF CAPACITY-ALLOCATION MECHANISMS AND CONGESTION-MANAGEMENT PROCEDURES CONCERNING TRANSMISSION SYSTEM OPERATORS AND THEIR APPLICATION IN THE EVENT OF CONTRACTUAL CONGESTION

### 2.1. Principles of capacity-allocation mechanisms and congestion-management procedures concerning transmission system operators

1. Capacity-allocation mechanisms and congestion-management procedures shall facilitate the development of competition and liquid trading of capacity and shall be compatible with market mechanisms including spot markets and trading hubs. They shall be flexible and capable of adapting to evolving market circumstances.

2. Those mechanisms and procedures shall take into account the integrity of the system concerned as well as security of supply.

3. Those mechanisms and procedures shall neither hamper the entry of new market participants nor create undue barriers to market entry. They shall not prevent market participants, including new market entrants and companies with a small market share, from competing effectively.

4. Those mechanisms and procedures shall provide appropriate economic signals for efficient and maximum use of technical capacity and facilitate investment in new infrastructure.

5. Network users shall be advised about the type of circumstance that could affect the availability of contracted capacity. Information on interruption should reflect the level of information available to the transmission system operator.

6. Should difficulties in meeting contractual delivery obligations arise due to system integrity reasons, transmission system operators should notify network users and seek a non-discriminatory solution without delay.

Transmission system operators shall consult network users regarding procedures prior to their implementation and agree them with the regulatory authority.

### 2.2. Congestion management procedures in the event of contractual congestion

#### 2.2.1. General Provisions

**1. The provisions of point 2.2 shall apply to interconnection points between adjacent entry-exit systems, irrespective of whether they are physical or virtual, between two or more**

**Contracting Parties** or within the same **Contracting Party** in so far as the points are subject to booking procedures by users **and subject to the decision of the relevant Contracting Party's national regulatory authority**. They may also apply to entry points from and exit points to third countries, subject to the decision of the relevant national regulatory authority. Exit points to end-consumers and distribution networks, entry points from LNG terminals and production facilities, and entry-exit points from and to storage facilities are not subject to the provisions of point 2.2.<sup>16</sup>

2. On the basis of the information published by the transmission system operators pursuant to Section 3 of this Annex and, where appropriate, validated by national regulatory authorities, **the Energy Community Regulatory Board** shall publish by 1 June of every year, commencing with the year 2020, a monitoring report on congestion at interconnection points with respect to firm capacity products sold in the preceding year, taking into consideration to the extent possible capacity trading on the secondary market and the use of interruptible capacity.<sup>17</sup>

3. Any additional capacity made available through the application of one of the congestion-management procedures as provided for in points 2.2.2, 2.2.3, 2.2.4 and 2.2.5 shall be offered by the respective transmission system operator(s) in the regular allocation process.

4. The measures provided for in points 2.2.2, 2.2.4 and 2.2.5 shall be implemented as of 1 October 2018. Points 2.2.3(1) to 2.2.3(5) shall apply as of 1 July 2020.<sup>18</sup>

### *2.2.2. Capacity increase through oversubscription and buy-back scheme*

1. Transmission system operators shall propose and, after approval by the national regulatory authority, implement an incentive-based oversubscription and buy-back scheme in order to offer additional capacity on a firm basis. Before implementation, the national regulatory authority shall consult with the national regulatory authorities of adjacent **Contracting Parties and the Member States of the European Union** and take account of the adjacent national regulatory authorities' opinions. Additional capacity is defined as the firm capacity offered in addition to the technical capacity of an interconnection point calculated on the basis of Article 16(1) of this Regulation.<sup>19</sup>

2. The oversubscription and buy-back scheme shall provide transmission system operators with an incentive to make available additional capacity, taking account of the technical conditions, such as the calorific value, temperature and expected consumption, of the relevant entry-exit system and the capacities in adjacent networks. Transmission system operators shall apply a dynamic approach with regard to the recalculation of the technical or additional capacity of the entry-exit system.

3. The oversubscription and buy-back scheme shall be based on an incentive regime reflecting the risks of transmission system operators in offering additional capacity. The scheme shall

<sup>16</sup> As adapted by Article 3(1) of Decision 2018/01/PHLG-EnC.

<sup>17</sup> As adapted by Article 3(2) of Decision 2018/01/PHLG-EnC.

<sup>18</sup> As adapted by Article 3(3) and (4) of Decision 2018/01/PHLG-EnC.

<sup>19</sup> As adapted by Article 3(5) of Decision 2018/01/PHLG-EnC.

be structured in such a way that revenues from selling additional capacity and costs arising from the buy-back scheme or measures pursuant to paragraph 6 are shared between the transmission system operators and the network users. National regulatory authorities shall decide on the distribution of revenues and costs between the transmission system operator and the network user.

4. For the purpose of determining transmission system operators' revenues, technical capacity, in particular surrendered capacity as well as, where relevant, capacity arising from the application of firm day-ahead use-it-or-lose-it and long term use-it-or-lose-it mechanisms, shall be considered to be allocated prior to any additional capacity.

5. In determining the additional capacity, the transmission system operator shall take into account statistical scenarios for the likely amount of physically unused capacity at any given time at interconnection points. It shall also take into account a risk profile for offering additional capacity which does not lead to excessive buy-back obligation. The oversubscription and buy-back scheme shall also estimate the likelihood and the costs of buying back capacity on the market and reflect this in the amount of additional capacity to be made available.

6. Where necessary to maintain system integrity, transmission system operators shall apply a market-based buy-back procedure in which network users can offer capacity. Network users shall be informed about the applicable buy-back procedure. The application of a buy-back procedure is without prejudice to the applicable emergency measures.

7. Transmission system operators shall, before applying a buy-back procedure, verify whether alternative technical and commercial measures can maintain system integrity in a more cost-efficient manner.

8. When proposing the oversubscription and buy-back scheme the transmission system operator shall provide all relevant data, estimates, and models to the national regulatory authority in order for the latter to assess the scheme. The transmission system operator shall regularly report to the national regulatory authority on the functioning of the scheme and, upon request of the national regulatory authority, provide all relevant data. The national regulatory authority may request the transmission system operator to revise the scheme.

### *2.2.3. Firm day-ahead use-it-or-lose-it mechanism*

1. National regulatory authorities shall require transmission system operators to apply at least the rules laid down in paragraph 3 per network user at interconnection points with respect to altering the initial nomination if, on the basis of the yearly monitoring report of the Energy Community Regulatory Board in accordance with point 2.2.1(2), it is shown that at interconnection points demand exceeded offer, at the reserve price when auctions are used, in the course of capacity allocation procedures in the year covered by the monitoring report for products for use in either that year or in one of the subsequent two years,

- (a) for at least three firm capacity products with a duration of one month or
- (b) for at least two firm capacity products with a duration of one quarter or
- (c) for at least one firm capacity product with a duration of one year or more or
- (d) where no firm capacity product with a duration of one month or more has been offered.

2. If, on the basis of the yearly monitoring report, it is shown that a situation as defined in paragraph 1 is unlikely to reoccur in the following three years, for example as a result of capacity becoming available from physical expansion of the network or termination of long-term contracts, the relevant national regulatory authorities may decide to terminate the firm day-ahead use-it-or-lose-it mechanism.

3. Firm renomination is permitted up to 90% and down to 10% of the contracted capacity by the network user at the interconnection point. However, if the nomination exceeds 80% of the contracted capacity, half of the non-nominated volume may be renominated upwards. If the nomination does not exceed 20% of the contracted capacity, half of the nominated volume may be renominated downwards. The application of this paragraph is without prejudice to the applicable emergency measures.

4. The original holder of the contracted capacity may renominate the restricted part of its contracted firm capacity on an interruptible basis.

5. Paragraph 3 shall not apply to network users - persons or undertakings and the undertakings they control pursuant to Article 3 of Regulation (EC) No 139/2004 - holding less than 10% of the average technical capacity in the preceding year at the interconnection point.

6. On interconnection points where a firm day-ahead use-it-or-lose-it mechanism in accordance with paragraph 3 is applied, an evaluation of the relationship with the oversubscription and buy-back scheme pursuant to point 2.2.2 shall be carried out by the national regulatory authority, which may result in a decision by the national regulatory authority not to apply the provisions of point 2.2.2 at those interconnection points. Such a decision shall be notified, without delay, to the [Energy Community Regulatory Board](#).

7. A national regulatory authority may decide to implement a firm day-ahead use-it-or-lose-it mechanism pursuant to paragraph 3 on an interconnection point. Before adopting its decision, the national regulatory authority shall consult with the national regulatory authorities of adjacent [Contracting Parties and the Member States of the European Union](#). In adopting its decision the national regulatory authority shall take account of the adjacent national regulatory authorities' opinions.<sup>20</sup>

#### **2.2.4. Surrender of contracted capacity**

Transmission system operators shall accept any surrender of firm capacity which is contracted by the network user at an interconnection point, with the exception of capacity products with a duration of a day and shorter. The network user shall retain its rights and obligations under the capacity contract until the capacity is reallocated by the transmission system operator and to the extent the capacity is not reallocated by the transmission system operator. Surrendered capacity shall be considered to be reallocated only after all the available capacity has been allocated. The transmission system operator shall notify the network user without delay of any reallocation of its surrendered capacity. Specific terms and conditions for surrendering capacity, in particular for cases where several network users surrender their capacity, shall be approved by the national regulatory authority.

<sup>20</sup> As adapted by Article 3(6) of Decision 2018/01/PHLG-EnC.

### **2.2.5. Long-term use-it-or-lose-it mechanism**

1. National regulatory authorities shall require transmission system operators to partially or fully withdraw systematically underutilised contracted capacity on an interconnection point by a network user where that user has not sold or offered under reasonable conditions its unused capacity and where other network users request firm capacity. Contracted capacity is considered to be systematically underutilised in particular if:

(a) the network user uses less than on average 80% of its contracted capacity both from 1 April until 30 September and from 1 October until 31 March with an effective contract duration of more than one year for which no proper justification could be provided; or

(b) the network user systematically nominates close to 100% of its contracted capacity and renominates downwards with a view to circumventing the rules laid down in point 2.2.3(3).

2. The application of a firm day-ahead use-it-or-lose-it mechanism shall not be regarded as justification to prevent the application of paragraph 1.

3. Withdrawal shall result in the network user losing its contracted capacity partially or completely for a given period or for the remaining effective contractual term. The network user shall retain its rights and obligations under the capacity contract until the capacity is reallocated by the transmission system operator and to the extent the capacity is not reallocated by the transmission system operator.

4. Transmission system operators shall regularly provide national regulatory authorities with all the data necessary to monitor the extent to which contracted capacities with effective contract duration of more than one year or recurring quarters covering at least two years are used.

3. DEFINITION OF THE TECHNICAL INFORMATION NECESSARY FOR NETWORK USERS TO GAIN EFFECTIVE ACCESS TO THE SYSTEM, THE DEFINITION OF ALL RELEVANT POINTS FOR TRANSPARENCY REQUIREMENTS AND THE INFORMATION TO BE PUBLISHED AT ALL RELEVANT POINTS AND THE TIME SCHEDULE ACCORDING TO WHICH THAT INFORMATION SHALL BE PUBLISHED

3.1. Definition of the technical information necessary for network users to gain effective access to the system

#### **3.1.1. Form of publication**

(1) Transmission system operators (TSOs) shall provide all information referred to under paragraph 3.1.2 and paragraph 3.3(1) to 3.3(5) in the following manner:

(a) on a website accessible to the public, free of charge and without any need to register or otherwise sign on with the transmission system operator;

(b) on a regular/rolling basis; the frequency shall be according to the changes that take place and the duration of the service;

(c) in a user-friendly manner;

(d) in a clear, quantifiable, easily accessible way and on a non-discriminatory basis;

(e) in a downloadable format that **has been agreed between transmission system operators and the national regulatory authorities on the basis of an opinion on a harmonised format**

that shall be provided by the **Energy Community Regulatory Board** and that allows for quantitative analyses;

(f) in consistent units, in particular kWh (with a combustion reference temperature of 298,15 K) shall be the unit for energy content and m<sup>3</sup> (at 273,15 K and 1,01325 bar) shall be the unit for volume. The constant conversion factor to energy content shall be provided. In addition to the format above, publication in other units is also possible;

(g) in the official language(s) of the Energy Community Contracting Party and in English.<sup>21</sup>

**(h) all data shall be made available as of 1 October 2018 on the <...> central platform, established by ENTSOG on a cost-efficient basis.**<sup>22</sup>

(2) Transmission system operators shall provide details on actual changes to all information referred to under paragraph 3.1.2 and paragraph 3.3(1) to 3.3(5) in a timely manner as soon as available to them.

### 3.1.2. Content of publication

Transmission system operators shall publish at least the following information about their systems and services:

(a) a detailed and comprehensive description of the different services offered and their charges;

(b) the different types of transportation contracts available for these services;

(c) the network code and/or the standard conditions outlining the rights and responsibilities of all network users including:

1. harmonised transportation contracts and other relevant documents;

2. if relevant for access to the system, for all relevant points as defined in paragraph 3.2 of this Annex, a specification of relevant gas quality parameters, including at least the gross calorific value and the Wobbe index, and the liability or costs of conversion for network users in case gas is outside these specifications;

3. if relevant for access to the system, for all relevant points information on pressure requirements;

4. the procedure in the event of an interruption of interruptible capacity, including, where applicable, the timing, extent, and ranking of individual interruptions (for example pro-rata or first-come-last-interrupted);

(d) the harmonised procedures applied when using the transmission system, including the definition of key terms;

(e) provisions on capacity allocation, congestion management and anti-hoarding and reutilisation procedures;

(f) the rules applicable for capacity trade on the secondary market vis-à-vis the transmission system operator;

(g) rules on balancing and methodology for the calculation of imbalance charges;

(h) if applicable, the flexibility and tolerance levels included in transportation and other services without

<sup>21</sup> As adapted by Article 4(1) litera (a) of Decision 2011/02/MC-EnC.

<sup>22</sup> As adapted by Article 3(7) and (8) of Decision 2018/01/PHLG-EnC.

separate charge, as well as any flexibility offered in addition to this and the corresponding charges;

(i) a detailed description of the gas system of the transmission system operator and its relevant points of interconnection as defined in paragraph 3.2 of this Annex as well as the names of the operators of the interconnected systems or facilities;

(j) the rules applicable for connection to the system operated by the transmission system operator;

(k) information on emergency mechanisms, as far as it is the responsibility of the transmission system operator, such as measures that can lead to the disconnection of customers groups and other general liability rules that apply to the transmission system operator;

(l) procedures agreed upon by transmission system operators at interconnection points, of relevance for access of network users to the transmission systems concerned, relating to interoperability of the network, agreed procedures on nomination and matching procedures and other agreed procedures that set out provisions in relation to gas flow allocations and balancing, including the methods used;

(m) transmission system operators shall publish a detailed and comprehensive description of the methodology and process, including information on the parameters employed and the key assumptions, used to calculate the technical capacity.

### 3.2. Definition of all relevant points for transparency requirements

(1) Relevant points shall include at least:

(a) all entry and exit points to and from a transmission network operated by a transmission system operator with the exception of exit points connected to a single final customer, and with the exception of entry points linked directly to a production facility of a single producer that is located within the Energy Community;

(b) all entry and exit points connecting balancing zones of transmission system operators;

(c) all points connecting the network of a transmission system operator with an LNG terminal, physical gas hubs, storage and production facilities, unless these production facilities are exempted under (a);

(d) all points connecting the network of a given transmission system operator to infrastructure necessary for providing ancillary services as defined by Article 2(14) of Directive 2009/73/EC.

(2) Information for single final customers and for production facilities, that is excluded from the definition of relevant points as described under 3.2(1)(a), shall be published in aggregate format, at least per balancing zone. The aggregation of single final customers and of production facilities, excluded from the definition of relevant points as described under 3.2(1)(a), shall for the application of this Annex be considered as one relevant point.

(3) Where points between two or more transmission operators are managed solely by the transmission operators concerned, with no contractual or operational involvement of system users whatsoever, or where points connect a transmission system to a distribution system and there is no contractual congestion at these points, transmission system operators shall be exempted for these points from the obligation to publish the requirements under paragraph 3.3 of this Annex. The national regulatory authority may require the transmission system operators to publish the requirements under paragraph 3.3 of this Annex for groups or all of the exempted points. In such case, the information, if available to the TSO, shall be published in an aggregated form at a meaningful level, at least per

balancing zone. This aggregation of these points shall for the application of this annex be considered as one relevant point.

3.3. Information to be published at all relevant points and the time schedule according to which that information should be published

(1) At all relevant points, transmission system operators shall publish the information as listed in paragraphs (a) to (g), for all services and ancillary services provided (in particular information on blending, ballasting and conversion). This information shall be published on a numerical basis, in hourly or daily periods, equal to the smallest reference period for capacity booking and (re-)nomination and the smallest settlement period for which imbalance charges are calculated. If the smallest reference period is different from a daily period, information as listed in paragraphs (a) to (g) shall be made available also for the daily period. This information and updates shall be published as soon as available to the system operator ("near real time").

(a) the maximum technical capacity for flows in both directions;

(b) the total contracted firm and interruptible capacity in both directions;

(c) the nominations and re-nominations in both directions;

(d) the available firm and interruptible capacity in both directions;

(e) actual physical flows;

(f) planned and actual interruption of interruptible capacity;

(g) planned and unplanned interruptions to firm services as well as the information on restoration of the firm services (in particular, maintenance of the system and the likely duration of any interruption due to maintenance). Planned interruptions shall be published at least 42 days in advance.

**(h) occurrence of unsuccessful, legally valid requests for firm capacity products with a duration of one month or longer including the number and volume of the unsuccessful requests; and**

**(i) in the case of auctions, where and when firm capacity products with a duration of one month or longer have cleared at prices higher than the reserve price;**

**(j) where and when no firm capacity product with a duration of one month or longer has been offered in the regular allocation process;**

**(k) total capacity made available through the application of the congestion-management procedures laid down in points 2.2.2, 2.2.3, 2.2.4 and 2.2.5 per applied congestion-management procedure;**

**(l) points (h) to (k) shall apply from 1 October 2018.**<sup>23</sup>

(2) At all relevant points, the information under paragraph 3.3(1)(a), (b) and (d) shall be published for a period of at least 24 months ahead.

(3) At all relevant points, transmission system operators shall publish historical information on the requirements of paragraph 3.3(1)(a) to (g) for the past 5 years on a rolling basis.

<sup>23</sup> As adapted by Article 3(9) of Decision 2018/01/PHLG-EnC.

(4) Transmission system operators shall publish measured values of the gross calorific value or the Wobbe index at all relevant points, on a daily basis. Preliminary figures shall be published at the latest 3 days following the respective gas day. Final figures shall be published within 3 months after the end of the respective month.

(5) For all relevant points, transmission system operators shall publish available capacities, booked and technical capacities, on an annual basis over all years where capacity is contracted plus 1 year, and at least for the next 10 years. This information shall be updated at least every month or more frequently, if new information becomes available. The publication shall reflect the period for which capacity is offered to the market.

#### 3.4. Information to be published regarding the transmission system and the time schedule according to which this information should be published

(1) Transmission system operators shall ensure the publication on a daily basis and updated every day the aggregated amounts of capacities offered, and contracted on the secondary market (i.e. sold from one network user to another network user), where the information is available to the TSO. This information shall include the following specifications:

- (a) interconnection point where the capacity is sold;
- (b) type of capacity, i.e. entry, exit, firm, interruptible;
- (c) quantity and duration of the capacity usage rights;
- (d) type of sale, e.g. transfer or assignment;
- (e) the total number of trades/transfers;
- (f) any other conditions known to the transmission system operator as mentioned in 3.3.

In so far such information is provided by a third party, transmission system operators shall be exempted from this provision.

(2) Transmission system operators shall publish harmonised conditions under which capacity transactions (e.g. transfers and assignments) will be accepted by them. These conditions must at least include:

- (a) a description of standardised products which can be sold on the secondary market;
- (b) lead time for the implementation/acceptation/registration of secondary trades. In case of delays the reasons have to be published;
- (c) the notification to the transmission system operator by the seller or the third party as referred to under 3.4(1) about name of seller and buyer and capacity specifications as outlined in 3.4(1).

In so far such information is provided by a third party, transmission system operators shall be exempted from this provision.

(3) Regarding the balancing service of its system, each transmission system operator shall provide to each network user, for each balancing period, its specific preliminary imbalance volumes and cost data per individual network user, at the latest 1 month after the end of the balancing period. Final data of customers supplied according to standardised load profiles may be provided up to 14 months later. In so far such information is provided by a third party, transmission system operators shall be exempted from this provision. The provision of this information shall respect confidentiality of commercially sensitive information.

(4) Where flexibility services, other than tolerances, are offered for third party access, transmission system operators shall publish daily forecasts on a day-ahead basis of the maximum amount of flexibility, the booked level of flexibility and the availability of flexibility for the market for the next gas day. The transmission system operator shall also publish *ex-post* information on the aggregate utilisation of every flexibility service at the end of each gas day. If the national regulatory authority is satisfied that such information could give room to potential abuse by network users, it may decide to exempt the transmission system operator from this obligation.

(5) Transmission system operators shall publish, per balancing zone, the amount of gas in the transmission system at the start of each gas day and the forecast of the amount of gas in the transmission system at the end of each gas day. The forecast amount of gas for the end of the gas day shall be updated on an hourly basis throughout the gas day. If imbalance charges are calculated on an hourly basis, the transmission system operator shall publish the amount of gas in the transmission system on an hourly basis. Alternatively, transmission system operators shall publish, per balancing zone, the aggregate imbalance position of all users at the start of each balancing period and the forecast of the aggregated imbalance position of all users at the end of each gas day. If the national regulatory authority is satisfied that such information could give room to potential abuse by network users, it may decide to exempt the transmission system operator from this obligation.

(6) Transmission system operators shall provide user-friendly instruments for calculating tariffs.

(7) Transmission system operators shall keep at the disposal of the relevant national authorities, for at least 5 years, effective records of all capacity contracts and all other relevant information in relation to calculating and providing access to available capacities, in particular individual nominations and interruptions. Transmission system operators must keep documentation of all relevant information under point 3.3(4) and (5) for at least 5 years and make them available to the regulatory authority upon request. Both parties shall respect commercial confidentiality.

## REGULATION (EU) 703/2015 of 30 April 2015 establishing a network code on interoperability and data exchange rules

Incorporated and adapted by Permanent High Level Group Decision 2018/02/PHLG-EnC of 12 January 2018

*The adaptations made by Permanent High Level Group Decision 2018/02/PHLG-EnC are highlighted in **bold and blue**.*

Whereas:

(1) Regulation (EC) No 715/2009 defines several tasks for the European network of transmission system operators for gas ('Entsog') and for the Agency for the Cooperation of Energy Regulators established by Regulation (EC) No 713/2009 of the European Parliament and of the Council (the 'Agency'). Amongst these is the development of European-wide network codes in the areas referred to in Article 8(6) of Regulation (EC) No 715/2009 to be applied by all transmission system operators for gas.

(2) In order to encourage and facilitate efficient gas trading and transmission across gas transmission systems within the Union, and thereby to move towards greater internal market integration, a network code on interoperability and data exchange rules as referred to in Article 8(6)(e) and (d) of Regulation (EC) No 715/2009 should be established, on the basis of a draft developed by Entsog and recommended by the Agency and in accordance with the procedure set out in Article 6 of Regulation (EC) No 715/2009.

(3) The lack of harmonisation in technical, operational and communication areas could create barriers to the free flow of gas in the Union, thus hampering market integration. Union interoperability and data exchange rules should allow the necessary harmonisation in those areas, therefore leading to effective market integration. For that purpose and for facilitating commercial and operational cooperation between adjacent transmission system operators, this Regulation should address interconnection agreements, units, gas quality, odourisation and data exchange. It should provide rules and procedures to reach an appropriate level of harmonisation towards efficient gas trading and transport across gas transmission systems in the Union.

(4) Adjacent transmission system operators should reinforce transparency as well as cooperation between them where differences in gas quality and odourisation practices at either side of an interconnection point might create an obstacle to gas market integration. The obligations provided for in this Regulation with particular regard to gas quality and odourisation are without prejudice to the competences of Member States.

(5) The provisions of this Regulation relating to gas quality should provide effective solutions without prejudice to the adoption of a European-wide standard for high-calorific gas as is being developed by CEN pursuant to the standardisation process under mandate M/400.

(6) The interoperability rules fixed in Articles 13, 17 and 18 aim at ensuring market integration as prescribed by Article 8(7) of the Regulation (EC) No 715/2009 and have a broader scope of application than solely interconnection points.

(7) Article 13 of this Regulation does not affect the units or reference conditions used by Member States for the purposes of Article 1(2) of Directive 2009/142/EC of the European Parliament and of

the Council . The concerned parties may use the conversion table in the Annex in line with EN ISO 13443 'Natural Gas — Standard reference conditions'.

(8) Chapter V of this Regulation should ensure the appropriate degree of harmonisation of data exchange for supporting the completion and functioning of the European internal gas market, security of supply and appropriate and secure access to information, facilitating cross-border transmission activities.

(9) The measures provided for in this Regulation are in accordance with the opinion of the Committee established pursuant to Article 51 of Directive 2009/73/EC of the European Parliament and of the Council.

(10) In accordance with Article 8(8) and (9) of Regulation (EC) No 715/2009 Entso-g should monitor and analyse the implementation of this Regulation and report its findings to the Agency in order to allow the Agency to fulfil its tasks under Article 9(1) of Regulation (EC) No 715/2009.

## CHAPTER I GENERAL PROVISIONS

### *Article 1*

#### Subject matter and scope

1. This Regulation establishes a network code which sets out rules regarding interoperability and data exchange as well as harmonised rules for the operation of gas transmission systems.

2. This Regulation shall apply at interconnection points **between the Contracting Parties to the Energy Community. The application at interconnection points within a Party is subject to the decision of the relevant national regulatory authority.** With regard to data publication, Article 13 shall apply to relevant points defined in paragraph 3.2 of Annex I to Regulation (EC) No 715/2009. In addition to interconnection points, Article 17 shall apply to other points on transmission network where the gas quality is measured. Article 18 shall apply to transmission systems. This Regulation may also apply at entry points from and exit points to third countries, subject to the decision of the national authorities.

3. <...>

### *Article 2*

#### Definitions

For the purposes of this Regulation, the definitions in Article 2 of Regulation (EC) No 715/2009 ... as well as in Article 2 of Directive 2009/73/EC shall apply. In addition, the following definitions shall apply:

(a) 'exceptional event' means any unplanned event that is not reasonably controllable or preventable and that may cause, for a limited period, capacity reductions, affecting thereby the quantity or quality of gas at a given interconnection point, with possible consequences on interactions between

transmission system operators as well as between transmission system operator and network users;

(b) 'initiating transmission system operator' means the transmission system operator initiating the matching process by sending the necessary data to the matching transmission system operator;

(c) 'lesser rule' means that, in case of different processed quantities at either side of an interconnection point, the confirmed quantity will be equal to the lower of the two processed quantities.

(d) 'matching process' is the process of comparing and aligning processed quantities of gas for network users at both sides of a specific interconnection point, which results in confirmed quantities for the network users;

(e) 'matching transmission system operator' means the transmission system operator performing the matching process and sending the result of the matching process to the initiating transmission system operator;

(f) 'measured quantity' means the quantity of gas that, according to the measurement equipment from the transmission system operator, has physically flowed across an interconnection point per time period;

(g) 'operational balancing account' means an account between adjacent transmission system operators, to be used to manage steering differences at an interconnection point in order to simplify gas accounting for network users involved at the interconnection point;

(h) 'processed quantity' means the quantity of gas determined by the initiating transmission system operator and by the matching transmission system operator, which takes into account the network user's nomination or re-nomination and contractual provisions as defined under the relevant transport contract and which is used as the basis for the matching process;

(i) 'steering difference' means the difference between the quantity of gas that the transmission system operators had scheduled to flow and the measured quantity for an interconnection point.

**(j) 'gas day' means the period from 5:00 to 5:00 UTC the following day for winter time and from 4:00 to 4:00 UTC the following day when daylight saving is applied;**

**(k) 'interconnection agreement' means an agreement entered into by adjacent transmission system operators, whose systems are connected at a particular interconnection point, which specifies terms and conditions, operating procedures and provisions, in respect of delivery and/or withdrawal of gas at the interconnection point with the purpose of facilitating efficient interoperability of the interconnected transmission networks;**

**(l) 'interconnection point' means a physical or virtual point connecting adjacent entry-exit systems or connecting an entry-exit system with an interconnector, in so far as these points are subject to booking procedures by network users;**

**(m) 'virtual interconnection point' means two or more interconnection points which connect the same two adjacent entry-exit systems, integrated together for the purposes of providing a single capacity service;**

**(n) 'confirmed quantity' means the quantity of gas confirmed by a transmission system operator to be scheduled or re-scheduled to flow on gas day D;**

**(o) 'allocation' means the quantity of gas attributed to a network user by a transmission system operator as an input or an off-take expressed in kWh for the purpose of determining**

**the daily imbalance quantity;**

**(p) 're-nomination cycle' means the process carried out by the transmission system operator in order to provide a network user with the message regarding the confirmed quantities following the receipt of a re-nomination.**

## **CHAPTER II INTERCONNECTION AGREEMENTS**

### **Article 3 General Provisions**

Adjacent transmission system operators shall ensure that at least the following terms and conditions detailed in Articles 6 to 12 are covered by **any future and existing** interconnection agreement in respect of each interconnection point:

- (a) rules for flow control;
- (b) measurement principles for gas quantities and quality;
- (c) rules for the matching process;
- (d) rules for the allocation of gas quantities;
- (e) communication procedures in case of exceptional events;
- (f) settlement of disputes arising from interconnection agreements;
- (g) amendment process for the interconnection agreement.

### **Article 4 Information obligation**

1. The transmission system operators shall identify the information contained in interconnection agreements that directly affects network users and shall inform them thereof.
2. Before concluding or amending an interconnection agreement which contains the rules referred to in Article 3(c), (d) and (e), transmission system operators shall invite network users to comment on the proposed text of those rules at least two months before the agreement is concluded or amended. The transmission system operators shall take the network users' comments into account when concluding or amending their interconnection agreement.
3. The mandatory terms of interconnection agreements listed in Article 3 or any amendments thereof concluded after the entry into force of this Regulation shall be communicated by the transmission system operators to their national regulatory authority and to Entso-g within 10 days after conclusion or amendment of the agreement. Transmission system operators shall also communicate interconnection agreements upon request of competent national authorities of the Contracting Party within 10 days.

## **Article 5**

### **Interconnection agreement template**

1. <...>

2. <...>

3. If adjacent transmission system operators fail to agree on one or more of the terms and conditions set out in Articles 6 to 10 in their interconnection agreement in accordance with Article 3, they shall conclude an interconnection agreement on the basis of the Entso-g template in respect of any term they failed to agree upon.

## **Article 6**

### **Rules for flow control**

1. In respect of flow control, the adjacent transmission system operators shall:

(a) ensure that rules are established in order to facilitate a controllable, accurate, predictable and efficient gas flow across the interconnection point;

(b) ensure that rules are established for steering the gas flow across the interconnection point and for minimising the deviations from the flow pursuant to the matching process;

(c) designate the transmission system operator who is responsible for steering the gas flow across the interconnection point. If the adjacent transmission system operators fail to agree on this designation, the transmission system operator that operates the flow control equipment shall, in cooperation with the other transmission system operator(s), be responsible for steering the gas flow across the interconnection point.

2. In order to steer the gas flow, the adjacent transmission system operators shall decide on the quantity and direction of the gas flow for each interconnection point and for each hour of the gas day.

The transmission system operator designated pursuant to point (c) of paragraph 1 shall be responsible for steering the gas flow across the interconnection point provided that contractual obligations regarding pressure are complied with by all adjacent transmission system operators:

(a) at a level of accuracy sufficient to minimise the steering difference; and

(b) at a level of stability in line with the efficient use of the gas transmission networks.

3. The quantity and direction of the gas flow decided by the adjacent transmission system operators shall reflect:

(a) the result of the matching process;

(b) the operational balancing account correction;

(c) any efficient flow control arrangements between the adjacent transmission system operators for purposes such as ramp-up, ramp-down, minimum flow, split of the flow at the virtual interconnection point if any, and/or switch of flow direction or operational cost efficiency;

(d) any arrangement managing cross-border trade restrictions due to gas quality differences pursuant to Article 15 and/or odourisation practices pursuant to Article 19.

4. A transmission system operator may decide to alter the quantity of gas or the gas flow direction or both, if this is needed, in order to:

- (a) comply with provisions laid down in national or Union safety legislation applicable to the interconnection point;
- (b) comply with requirements laid down in Emergency Plans and Preventive Action Plans developed in accordance with **applicable Energy Community legislation on security of gas supply**;
- (c) react in case the operator's system is affected by an exceptional event.

### **Article 7**

#### **Measurement principles for gas quantity and quality**

1. In respect of the measurement principles for volume, energy and gas quality, the adjacent transmission system operators shall ensure that:

- (a) the details of the measurement standards applicable at the interconnection point are established;
- (b) the transmission system operator responsible for the installation, operation and maintenance of the measurement equipment is identified. This operator shall have the obligation to make all information and data in respect of the measurement of gas flows at the interconnection point available to the other adjacent transmission system operator(s) in a timely manner and at a frequency specified.

2. The installation, operation and maintenance of measurement equipment at an interconnection point shall take into account the technical requirements imposed by national regulations on the adjacent transmission system operators.

3. The adjacent transmission system operators shall agree on measurement principles which shall at least include:

- (a) a description of the metering station including measurement and analysis equipment to be used and details of any secondary equipment that may be used in case of failure;
- (b) the gas quality parameters and volume and energy that shall be measured, as well as the range and the maximum permissible error or uncertainty margin within which the measurement equipment shall operate, the frequency of measurements, in what units and according to what standards the measurement shall be made as well as any conversion factors used;
- (c) the procedures and methods that shall be used to calculate those parameters which are not directly measured;
- (d) a description of the method of calculation in respect of the maximum permissible error or uncertainty in the determination of energy transported;
- (e) a description of the data validation process in use for the measured parameters;
- (f) the measurement validation and quality assurance arrangements, including verification and adjustment procedures to be agreed between the adjacent transmission system operators;
- (g) the way data, including frequency and content, is provided among the adjacent transmission system operators in respect of the measured parameters;
- (h) the specific list of signals and alarms to be provided by the adjacent transmission system operator(s)

who operate(s) the measurement equipment to the other adjacent transmission system operator(s);

(i) the method of determining a correction to a measurement and any subsequent procedures that may be necessary in a temporary situation where the measurement equipment is found to be or have been in error (either under-reading or over-reading outside of its defined uncertainty range). This transmission system operator shall take appropriate action to end this situation.

(j) rules that shall apply between adjacent transmission system operators in the event of failure of the measurement equipment;

(k) rules that shall apply between the adjacent transmission system operators for:

(i) access to the measurement facility;

(ii) additional verifications of measurement facility;

(iii) modification of the measurement facility; (iv) attendance during calibration and maintenance work at the measurement facility.

4. If the adjacent transmission system operators fail to comply with their obligations provided for in paragraphs 1 and 3:

(a) the transmission system operator in control of the measurement equipment shall be responsible for the installation, operation and maintenance of such equipment and for providing the other transmission system operator with the data regarding the measurement of gas flows at the interconnection point in a timely manner;

(b) the European standard EN1776 'Gas Supply Natural Gas Measuring Stations Functional Requirements' in the version applicable at the time shall apply.

### **Article 8**

#### **Rules for the matching process**

1. In respect of the matching process, the adjacent transmission system operators shall establish:

(a) the rules detailing the matching process taking into account daily-hourly nomination arrangements where relevant;

(b) the rules governing the communication and processing of the relevant data among the adjacent transmission system operators in order to calculate the processed quantities and confirmed quantities of gas for network users and the quantity of gas that needs to be scheduled to flow at the interconnection point(s).

2. Nominations and re-nominations shall be managed in accordance with the following:

(a) the application of a matching rule shall lead to identical confirmed quantities for each pair of network users at both sides of the interconnection point when processed quantities are not aligned;

(b) the adjacent transmission system operators may agree to maintain or implement a matching rule other than the lesser rule, provided that this rule is published and network users are invited to comment on the proposed matching rule within a period of time of not less than two months after publication of the matching rule;

(c) the adjacent transmission system operators shall specify their respective roles in the matching

process by indicating whether they are the initiating or the matching transmission system operator;

(d) the adjacent transmission system operators shall specify the applicable time schedule for the matching process within the nomination or re-nomination cycle, given that the whole matching process shall not take more than two hours from the starting of the nomination or re-nomination cycle, and shall take into account:

- (i) the data that needs to be exchanged between the adjacent transmission system operators in order to enable them to inform network users of their confirmed quantities before the end of the nomination or re-nomination cycle, including as a minimum the data referred to in paragraph 4(b);
- (ii) the data exchange process defined in point (i) above shall enable the adjacent transmission system operators to perform all calculation and communication steps in an accurate and timely manner.

3. When processing nominations for an interconnection point, the adjacent transmission system operators shall ensure that the gas flow at both sides of the interconnection point is calculated on a consistent basis taking into account any temporary reduction of capacity due to any of the conditions referred to in Article 6(4) on one or both sides of the interconnection point.

4. Each interconnection agreement shall specify in its provisions on data exchange for the matching process:

(a) the use of data exchange between the adjacent transmission system operators for the matching process;

(b) the harmonised information contained within the data exchange for the matching process which shall contain at least the following:

- (i) interconnection point identification;
- (ii) network user identification or if applicable its portfolio identification;
- (iii) identification of the party delivering to or receiving gas from the network user or if applicable its portfolio identification;
- (iv) start and end time of the gas flow for which the matching is made;
- (v) gas day;
- (vi) processed and confirmed quantities;
- (vii) direction of gas flow.

5. Unless otherwise agreed by the adjacent transmission system operators in their interconnection agreement, the following shall apply:

(a) the transmission system operators shall use the lesser rule. The application of the lesser rule as the default rule may only be restricted in case the conditions of point 2.2.3.1 of Annex I of Regulation (EC) No 715/2009 are fulfilled and its application would prevent the offer of firm capacity from the congestion management procedures;

(b) the transmission system operator in control of the flow control equipment shall be the matching transmission system operator;

(c) the transmission system operators shall perform the matching process in the following sequential steps:

- (i) calculating and sending of processed quantities of gas by the initiating transmission system operator within 45 minutes of the start of the nomination or re-nomination cycle;
- (ii) calculating and sending of confirmed quantities of gas by the matching transmission system operator within 90 minutes from the start of the nomination or re-nomination cycle;
- (iii) sending confirmed quantities of gas to network users and scheduling the gas flow across the interconnection point by the adjacent transmission system operators within two hours from the start of the nomination or re-nomination cycle. These sequential steps shall be without prejudice to the <...> minimum interruption lead times <...> **decided jointly by adjacent transmission system operators** and paragraph 2 (d) of this Article.

**The default minimum interruption lead time for a given gas hour shall be forty five minutes after the start of the re-nomination cycle for that gas hour. Where two transmission system operators wish to shorten the lead time for interruptions, any related agreement entered into between the transmission system operators shall be subject to competent national regulatory authority approval.**

### **Article 9**

#### **Rules for the allocation of gas quantities**

1. In respect of the allocation of gas quantities, the adjacent transmission system operators shall establish rules ensuring consistency between the allocated quantities at both sides of the interconnection point.
2. Unless otherwise agreed in the interconnection agreement, the transmission system operators shall use an operational balancing account. The transmission system operator in control of the measurement equipment shall recalculate the operational balancing account with validated quantities and communicate it to the adjacent transmission system operator(s).
3. Where an operational balancing account applies:
  - (a) the steering difference shall be allocated to an operational balancing account of the adjacent transmission system operators and the allocations to be provided by each adjacent transmission system operator to their respective network users shall be equal to the confirmed quantities;
  - (b) the adjacent transmission system operators shall maintain an operational balancing account balance that is as close to zero as possible; (c) the operational balancing account limits shall take into account specific characteristics of each interconnection point and/or the interconnected transmission networks, in particular:
    - (i) physical characteristics of the interconnection point;
    - (ii) linepack capability of each transmission network;
    - (iii) the total technical capacities at the interconnection point;
    - (iv) gas flow dynamics at the interconnected transmission networks.

Where the defined limits of the operational balancing account are reached, the adjacent transmission system operators may agree to extend those limits in order to provide allocations to network users that are equal to their confirmed quantities or otherwise allocate quantities to network users

proportionally based on the measured quantity.

4. The adjacent transmission system operators may agree to maintain or implement an allocation rule other than the operational balancing account, provided that this rule is published and network users are invited to comment on the proposed allocation rule within at least two months after publication of the allocation rule.

### **Article 10**

#### **Communication procedures in case of exceptional events**

1. The adjacent transmission system operators shall ensure that communication procedures which facilitate fast and simultaneous communication in cases of exceptional events are established. Unless otherwise agreed, the communication between the involved transmission system operators shall be performed by oral communication in English for information, followed by an electronic written confirmation.

2. The transmission system operator affected by an exceptional event shall be required, as a minimum, to inform its network users with respect to point (b) and (c) of this paragraph if there is a potential impact on their confirmed quantities and the adjacent transmission system operator(s) with respect to point (a) and (c) of this paragraph of the occurrence of such exceptional event and to provide all necessary information about:

(a) the possible impact on the quantities and quality of gas that can be transported through the interconnection point;

(b) the possible impact on the confirmed quantities for network users active at the concerned interconnection point(s);

(c) the expected and actual end of the exceptional event.

3. <...>

### **Article 11**

#### **Settlement of disputes arising from Interconnection Agreements**

1. The adjacent transmission system operators shall endeavour to solve amicably any disputes arising out of or in connection with the interconnection agreement and specify therein a dispute settlement mechanism for disputes which could not be amicably settled. The dispute settlement mechanism shall at least specify:

(a) the applicable law; and

(b) the court of jurisdiction or the terms and conditions of the appointment of experts either within the framework of an institutional forum or on an ad hoc basis, which may include arbitration.

<...>

2. <...>

**Article 12****Amendment process**

1. The adjacent transmission system operators shall establish a transparent and detailed amendment process of their interconnection agreement to be triggered by a written notice of one of the transmission system operators.
2. If the adjacent transmission system operators fail to reach an agreement on the amendment process, they may use the dispute settlement mechanisms developed in accordance with Article 11.

**CHAPTER III****UNITS****Article 13****Common set of units**

1. Each transmission system operator shall use the common set of units defined in this Article for any data exchange and data publication related to Regulation (EC) No 715/2009.
2. For the parameters of pressure, temperature, volume, gross calorific value, energy, and Wobbe-index the transmission system operators shall use:
  - (a) pressure: bar
  - (b) temperature: °C (degree Celsius)
  - (c) volume: m<sup>3</sup>
  - (d) gross calorific value (GCV): kWh/m<sup>3</sup>
  - (e) energy: kWh (based on GCV)
  - (f) Wobbe-index: kWh/m<sup>3</sup> (based on GCV)

For pressure, the transmission system operators shall indicate whether it refers to absolute pressure (bar (a)) or gauge pressure (bar (g)).

The reference conditions for volume shall be 0 °C and 1,01325 bar(a). For GCV, energy and Wobbe-index the default combustion reference temperature shall be 25 °C.

Whenever transmission system operators communicate data on the volume, GCV, energy and Wobbe-index, they shall specify under which reference conditions these values were calculated.

3. In cases where one **Contracting Party** is connected to only one other **Contracting Party one Member State of the European Union**, the adjacent transmission system operators and the parties they communicate with may agree to continue to use other reference conditions for data exchange in connection with Regulation (EC) No 715/2009, subject to the approval of their national regulatory authorities.

**Article 14****Additional units**

The transmission system operators and the parties they communicate with in connection with Regulation (EC) No 715/2009 may agree to use, in addition to the common set of units, additional units or reference conditions for data exchange or data publication. In such a situation conversion between reference conditions shall be done on the basis of the actual gas composition. If the relevant gas composition data is not available, the conversion factors used shall be consistent with the Annex based on EN ISO 13443 'Natural gas — Standard reference conditions' in the version applicable at the time.

**CHAPTER IV****GAS QUALITY AND ODOURISATION****Article 15****Managing cross-border trade restrictions due to gas quality differences**

1. Transmission system operators shall cooperate to avoid restrictions to cross-border trade due to gas quality differences. These actions, initiated and carried out by the transmission system operators in their standard operations, may include, among others, swapping and co-mingling.

2. Where a restriction to cross-border trade due to gas quality differences cannot be avoided by the concerned transmission system operators and is recognised by the national regulatory authorities, those authorities may require the transmission system operators to perform, within 12 months, the actions referred to in points (a) to (e) in sequence:

(a) cooperate and develop technically feasible options, without changing the gas quality specifications, which may include flow commitments and gas treatment, in order to remove the recognised restriction;

(b) jointly carry out a cost benefit analysis on the technically feasible options to define economically efficient solutions which shall specify the breakdown of costs and benefits among the categories of affected parties;

(c) produce an estimate of the implementation time for each potential option;

(d) conduct a public consultation on identified feasible solutions and take into consideration the results of the consultation;

(e) submit a joint proposal for removing the recognised restriction, including the timeframe for implementation, based on the cost benefit analysis and results of the public consultation to their respective national regulatory authorities for approval and to the other competent national authorities of each involved Contracting Party for information.

Where the concerned transmission system operators do not reach an agreement on a solution, each transmission system operator shall promptly inform its national regulatory authority.

3. Before adopting a decision pursuant to point (e) of paragraph 2, each national regulatory authority shall consult the national regulatory authorities of the concerned Contracting Parties. In adopting its

decision, each national regulatory authority shall take account of the adjacent national regulatory authorities' opinion with a view to have a coordinated decision based on mutual agreement.

### **Article 16**

#### **Short term monitoring on gas quality — data publication**

Transmission system operators shall publish on their website for each interconnection point, with a frequency of at least once per hour during the gas day, the Wobbe-index and gross calorific value for gas directly entering their transmission networks at all physical interconnection points.

**Exceptionally, for the interconnection points without adequate measurement equipment in place at the moment of adoption of this Regulation, a frequency of publishing the Wobbe-index and gross calorific value shall be once per gas day. In such cases, the transmission system operator is obliged to submit a request for exemption without delay to the relevant regulatory authority. A request for exemption has to include a proposal on installing adequate measurement equipment with exact deadline of putting such equipment in operation, which cannot be longer than 2 years. An exemption has to be confirmed by the regulatory authorities having the jurisdiction over adjacent transmission system operators.**

Entsog shall publish on its <...> central platform established pursuant to point 3.1.1(1)(h) of Annex I of Regulation (EC) No 715/2009 a link to the relevant information on the websites of the transmission system operators.

### **Article 17**

#### **Information provision on short-term gas quality variation**

1. In addition to interconnection points, this Article shall apply to other points on transmission networks where the gas quality is measured.

2. A transmission system operator may select one or several of the following parties to receive information on gas quality variation:

(a) final customers directly connected to the transmission system operator's network, whose operational processes are adversely affected by gas quality changes or a network user acting on behalf of a final customer whose operational processes are adversely affected by gas quality changes, where a direct contractual arrangement between a transmission system operator and its directly connected final customers is not foreseen by the national rules;

(b) distribution system operators directly connected to the transmission system operator's network, with connected final customers whose operational processes are adversely affected by gas quality changes;

(c) storage system operators directly connected to the transmission system operator's network, whose operational processes are adversely affected by gas quality changes.

3. Each transmission system operator shall:

- (a) define and maintain a list of parties entitled to receive indicative gas quality information;
- (b) cooperate with the parties identified in the above list in order to assess:
  - (i) the relevant information on gas quality parameters to be provided;
  - (ii) the frequency for the information to be provided;
  - (iii) the lead time;
  - (iv) the method of communication.

4. Paragraph 3 shall not impose an obligation on transmission system operators to install additional measurement or forecasting equipment, unless otherwise required by the national regulatory authority. The information under paragraph 3(b)(i) of this Article shall be provided as the transmission system operator's best estimate at a point in time and for the internal use of the recipient of the information.

### **Article 18**

#### **Long-term monitoring on gas quality in transmission systems**

1. EntsoG shall publish every two years a long-term gas quality monitoring outlook for transmission systems in order to identify the potential trends of gas quality parameters and respective potential variability within the next 10 years. The first long-term gas quality monitoring outlook shall be published along with the Ten-Year Network Development Plan of 2017.
2. The outlook shall be based on the inputs gathered in the framework of the regional cooperation established within EntsoG in accordance with Article 12(1) of Regulation (EC) No 715/2009.
3. The long-term gas quality monitoring outlook shall cover at least the Wobbe-index and gross calorific value. Additional gas quality parameters may be included after consultation with the stakeholders referred to in paragraph 8.
4. The long-term gas quality monitoring outlook shall identify potential new supply sources from a gas quality perspective.
5. In order to define the reference values of gas quality parameters for the respective supply sources to be used in the outlook, an analysis of the previous years shall be carried out. Such data may be replaced by stakeholders' inputs which result from the stakeholders' engagement process referred to in paragraph 8.
6. For every gas quality parameter considered and every region, the analysis shall result in a range within which the parameter is likely to evolve.
7. The long-term gas quality monitoring outlook shall be consistent and aligned with the EntsoG Union-wide Ten-Year Network Development Plan under preparation at the same time.
8. The stakeholders' consultation process used for the Union-wide Ten-Year Network Development Plan shall be expanded to include gas quality as an item. Through this process, stakeholders shall be invited to provide EntsoG with their views on the evolution of gas quality parameters of supplies.

## **Article 19**

### **Managing cross-border trade restrictions due to differences in odourisation practices**

1. Where a restriction to cross-border trade due to differences in odourisation practices cannot be avoided by the concerned transmission system operators and is recognised by national authorities, the authorities may require the concerned transmission system operators to reach an agreement within six months, which may include swapping and flow commitments, to solve any restriction recognised. The concerned adjacent transmission system operators shall provide their respective national authorities with the agreement for approval.

2. Where no agreement can be reached between the concerned transmission system operators after the six-month period referred to in paragraph 1 or where the national authorities agree that the proposed agreement by the concerned adjacent transmission system operators is not sufficiently effective to remove the restriction, the concerned transmission system operators, in cooperation with national authorities, shall, within the following 12 months, define a detailed plan setting out the most cost effective method to remove a recognised restriction at the specific cross-border interconnection point.

3. For the purpose of fulfilling the obligations under paragraph 2, the concerned transmission system operators shall in sequence:

(a) develop options to remove the restriction by identifying and assessing:

- (i) a conversion towards cross-border physical flow of non-odourised gas;
- (ii) the potential physical flow of odourised gas into the non-odourised transmission network or part thereof and interconnected downstream systems;
- (iii) an acceptable level of odourant for cross-border physical gas flow.

(b) jointly carry out a cost-benefit analysis on the technically feasible options to define economically efficient solutions. That analysis shall:

- (i) take into account the level of safety;
- (ii) include information on projected volumes of gas to be transported and details of costs of necessary infrastructure investments;
- (iii) specify the breakdown of costs and benefits between the categories of affected parties;

(c) produce an estimate of the implementation time for each potential option;

(d) conduct a public consultation and take into consideration the results of such consultation;

(e) submit the feasible solutions including the cost recovery mechanism and implementation timing to the national authorities for approval.

Once a solution is approved by the national authorities, that solution shall be implemented in accordance with the timeframe provided for in point (e).

4. If the national authorities do not approve any solution submitted under point (e) of paragraph 3 within six months from its submission or if the concerned transmission system operators fail to propose a solution within the 12 months' framework of paragraph 2, a shift towards the cross-border physical flow of non-odourised gas shall be implemented within a time-frame approved by the national authorities, but not exceeding four years. After a full technical shift towards non-odourised

gas, transmission system operators shall accept technically unavoidable levels of successively reducing residual amounts of odourants in cross-border flows.

## CHAPTER V DATA EXCHANGE

### *Article 20*

#### **General provisions**

1. For the purposes of this Chapter, 'counterparties' means network users active at:
  - (a) interconnection points; or
  - (b) both interconnection points and virtual trading points.
2. The data exchange requirements foreseen by point 2.2 of Annex I to Regulation (EC) No 715/2009 <...> and this Regulation between transmission system operators and from transmission system operators to their counterparties shall be fulfilled by common data exchange solutions set out in Article 21.

### *Article 21*

#### **Common data exchange solutions**

1. Depending on the data exchange requirements under Article 20(2), one or more of the following types of data exchange may be implemented and used:
  - (a) document-based data exchange: the data is wrapped into a file and automatically exchanged between the respective IT systems;
  - (b) integrated data exchange: the data is exchanged between two applications directly on the respective IT systems;
  - (c) interactive data exchange: the data is exchanged interactively through a web application via a browser.
2. The common data exchange solutions shall comprise the protocol, the data format and the network. The following common data exchange solutions shall be used for each of the types of data exchange listed in paragraph 1:
  - (a) For the document-based data exchange:
    - (i) protocol: AS4;
    - (ii) data format: Edig@s-XML, or an equivalent data format ensuring identical degree of interoperability, **as published by** Entso-g.
  - (b) For the integrated data exchange:
    - (i) protocol: HTTP/S-SOAP;
    - (ii) data format: Edig@s-XML, or an equivalent data format ensuring identical degree of interoperability, **as published by** Entso-g.

(c) For the interactive data exchange, the protocol shall be HTTP/S.

For all data exchange types set out in points (a) to (c), the network shall be internet.

3. <...>

### **Article 22**

#### **Data exchange system security and availability**

1. Each transmission system operator and each counterparty shall be responsible for ensuring that the appropriate security measures are undertaken. In particular, they shall:

(a) secure the communication chain in order to provide secured and reliable communications, including the protection of the confidentiality by encryption, integrity and the authenticity by signature of the sender and non-repudiation by a signed confirmation;

(b) implement appropriate security measures in order to prevent unauthorised access of their IT infrastructure;

(c) notify the other parties it communicates with, without delay, in regard to any unauthorised access which has or may have occurred on his own system.

2. Each transmission system operator shall be responsible for ensuring the availability of its own system and shall:

(a) take appropriate measures to prevent that a single point of failure causes an unavailability of the data exchange system, including up to the network connection(s) with the internet service provider(s);

(b) obtain the appropriate services and support from its internet service provider(s);

(c) keep the downtime, as a consequence of planned IT maintenance, to a minimum and shall inform its counterparties in a timely manner, prior to the planned unavailability.

### **Article 23**

#### **Implementation of the common data exchange solutions**

1. Depending on the data exchange requirements under Article 20(2), transmission system operators shall make available and use the common data exchange solutions defined in Article 21.

2. Where data exchange solutions between a transmission system operator and concerned counterparties are in place on **1 October 2018** and provided that the existing data exchange solutions are compatible with Article 22 and with data exchange requirements under Article 20(2), the existing data exchange solutions may continue to apply after consultation with network users and subject to the approval of the national regulatory authority of the transmission system operator.

**Article 24****Development process for common network operation tools**

1. For each data exchange requirement under Article 20(2), a common network operation tool **developed by Entso-g** in accordance with Article 8(3)(a) of Regulation (EC) No 715/2009 **exists**. A common network operation tool shall specify the common data exchange solution relevant for the respective data exchange requirement **as mentioned in Article 21**. A common network operation tool may also include business requirement specifications, release management and implementation guidelines.

**CHAPTER VI  
FINAL PROVISIONS****Article 25****Implementation monitoring**

1. **Six months after the expiry of the deadline for transposing and implementing this Regulation the Energy Community Secretariat** shall monitor and analyse how transmission system operators have implemented Chapters II to V of this Regulation <...> **and submit its report to the Energy Community Permanent High Level Group**.
2. By at the latest **three months after the expiry of the deadline for transposing and implementing this Regulation** transmission system operators shall communicate to **the Energy Community Secretariat** all necessary information enabling **the Energy Community Secretariat** to comply with its obligations under paragraph 1.

**Article 26****Entry into force<sup>1</sup>**

1. **Each Contracting Party shall transpose and implement Commission Regulation (EU) No 2015/703 by 1 October 2018.**
2. **This Decision [2018/02/PHLG-EnC] shall be made binding on all market participants. Transposition shall be made without changes to the structure and text of Commission Regulation (EU) No 2015/703 other than translation and the adaptations made by the present Decision.**
3. **Each Contracting Party shall notify the Energy Community Secretariat of completed transposition within two weeks following the adoption of such measures.**
4. **In transposing this Decision [2018/02/PHLG-EnC] Contracting Parties shall task national regulatory authorities with the monitoring of and enforcing compliance with this Decision [2018/02/PHLG-EnC].**

## **COMMISSION REGULATION (EU) 2017/459 of 16 March 2017 establishing a network code on capacity allocation mechanisms in gas transmission systems and repealing Regulation (EU) 984/2013<sup>1</sup>**

Incorporated and adapted by Permanent High Level Group Decision 2018/06/PHLG-EnC of 28 November 2018.

*The adaptations made by Permanent High Level Group Decision 2018/06/PHLG-EnC are highlighted in **bold and blue**.*

Whereas:

(1) Regulation (EC) No 715/2009 sets non-discriminatory rules for access conditions to natural gas transmission systems with a view to ensuring the proper functioning of the internal market in gas.

(2) Duplication of gas transmission systems is in most cases neither economic nor efficient. Competition in natural gas markets therefore requires a transparent and non-discriminatory access to gas infrastructure for all network users. However, in large parts of the Union the lack of equal and transparent access to transmission capacity remains a major obstacle for achieving effective competition on the wholesale market. Furthermore, the fact that national rules differ from one Member State to another hampers the creation of a well-functioning internal market for gas.

(3) Inefficient use of and limited access to the Union's high-pressure gas pipelines lead to suboptimal market conditions. A more transparent, efficient and non-discriminatory system of allocation of scarce transmission capacities needs to be implemented for the Union's gas transmission systems, so that cross-border competition can further develop and market integration can progress. Developing such rules has been consistently supported by stakeholders.

(4) Bringing about effective competition between suppliers from inside and outside the Union requires that they are able to flexibly use the existing transmission systems to ship their gas according to price signals. Only a well-functioning network of interconnected transmission grids, offering equal access conditions to all, allows gas to flow freely across the Union. That in turn attracts more suppliers, increasing liquidity at the trading hubs and contributing to efficient price discovery mechanisms and consequently fair gas prices that are based on the principle of demand and supply.

(5) Commission Regulation (EU) No 984/2013 establishing a network code on capacity allocation mechanism in gas transmission systems aimed to achieve the necessary degree of harmonisation across the Union. The effective implementation of that Regulation furthermore relied on the introduction of tariff systems which are consistent with the capacity allocation mechanisms proposed in this Regulation, to ensure the implementation without detrimental effect on the revenues and cash flow positions of transmission system operators.

(6) This Regulation has wider scope than Regulation (EU) No 984/2013 principally in terms of the rules for the offer of incremental capacity and clarifies certain provisions related to the definition and

<sup>1</sup> Commission Regulation (EU) No 984/2013 of 14 October 2013 establishing a Network Code on Capacity Allocation Mechanisms in Gas Transmission Systems and supplementing Regulation (EC) No 715/2009 of the European Parliament and of the Council

offer of firm and interruptible capacities and to improving the alignment of contractual terms and conditions of respective transmission system operators for the offer of bundled capacity. Provisions in this Regulation relative to the coordination of maintenance and the standardisation of communication should be interpreted in the context of Commission Regulation (EU) 2015/703.

(7) In order to allow network users to benefit from capacity allocation mechanisms harmonised to the widest extent in an integrated market, this Regulation should apply to non-exempted capacities in major new infrastructures which have received an exemption from Article 32 of Directive 2009/73/EC of the European Parliament and of the Council, to the extent the application of this Regulation does not undermine such an exemption and taking into account the specific nature of interconnectors when bundling capacity.

(8) This Regulation should be without prejudice to application of Union and national competition rules, in particular the prohibitions of restrictive agreements (Article 101 of the Treaty on the Functioning of the European Union) and of abuse of a dominant position (Article 102 of the Treaty on the Functioning of the European Union). The capacity allocation mechanisms put in place should be designed in such a way as to avoid foreclosure of downstream supply markets.

(9) In order to ensure that the offer of firm capacity is maximised by transmission system operators, a hierarchy of products should be observed by which yearly, quarterly and monthly interruptible capacity is only offered if firm capacity is not available.

(10) Where the respective terms and conditions applicable to the offer of bundled capacity products by transmission system operators on two sides of an interconnection point differ substantially, the value and usefulness for network users of booking bundled capacity may be limited. A process should therefore be launched, guided by the Agency for the Cooperation of Energy Regulators ('the Agency') and the European Network of Transmission System Operators for Gas ('ENTSO-G'), by which such terms and conditions of transmission system operators across the Union for bundled capacity products should be assessed and aligned to the extent possible, with a view to creating a common template of terms and conditions.

(11) A streamlined and harmonised Union-wide process for the offer of incremental capacity is necessary to react to possible market demand for such capacity. Such a process should consist of regular demand assessments followed by a structured phase of design and allocation, based on effective cooperation between transmission system operators and national regulatory authorities across Union borders. Any investment decision to be taken further to the assessment of market demand for capacity should be subject to an economic test to determine the economic viability. This economic test should in turn ensure that network users demanding capacity assume the corresponding risks associated with their demand to avoid captive customers from being exposed to the risk of such investments.

(12) Capacity allocation in the context of standard incremental projects should be undertaken in the form of the standard auction allocation process in order to guarantee the highest level of transparency and non-discrimination. In the case of large and complex projects affecting several Member States, transmission system operators should however be allowed to use alternative allocation mechanisms. Those mechanisms should provide the necessary flexibility to enable the investment in case there is genuine market demand, but they should still be aligned across borders. In case an alternative allocation mechanism is allowed, market foreclosure must be prevented by requiring a higher quota of capacity to be set aside for short-term bookings.

(13) In implementing complex entry-exit regimes, particularly with physical gas flows — destined for other markets — across those zones, transmission system operators have implemented and national regulatory authorities have approved different contractual approaches to firm capacity products the effect of which should be assessed in an Union-wide context.

(14) National regulatory authorities and transmission system operators should have regard to best practices and endeavours to harmonise processes for the implementation of this Regulation. Acting in accordance with Article 7 of Regulation (EC) No 713/2009 of the European Parliament and of the Council, the Agency and the national regulatory authorities should ensure that capacity allocation mechanisms are implemented at the applicable interconnection points across the Union in the most effective way.

(15) The measures provided for in this Regulation are in accordance with the opinion of the Committee established pursuant to Article 51 of Directive 2009/73/EC.

## CHAPTER I GENERAL PROVISIONS

### *Article 1*

#### **Subject matter**

This Regulation establishes a network code setting up capacity allocation mechanisms in gas transmission systems for existing and incremental capacity. This Regulation shall set out how adjacent transmission system operators cooperate in order to facilitate capacity sales, having regard to general commercial as well as technical rules related to capacity allocation mechanisms.

### *Article 2*

#### **Scope**

1. This Regulation shall apply to interconnection points **between Contracting Parties**. It may also apply to entry points from and exit points to third countries, subject to the decision of the relevant national regulatory authority. This Regulation shall not apply to exit points to end consumers and distribution networks, entry points from 'liquefied natural gas' (LNG) terminals and production facilities, and entry points from or exit points to storage facilities.
2. The standardised capacity allocation mechanisms set up in accordance with this Regulation shall include an auction procedure for relevant interconnection points within the **Energy Community** and the standard capacity products to be offered and allocated. Where incremental capacity is offered, alternative allocation mechanisms may also be used, subject to the conditions set out in Article 30(2).
3. This Regulation shall apply to all technical and interruptible capacity at interconnection points as well as to additional capacity in the meaning of point 2.2.1 of Annex I of Regulation (EC) No 715/2009 and to incremental capacity. <...>
4. Where an alternative capacity allocation mechanism according to Article 30 is applied, Article 8(1) to (7), Articles 11 to 18, Article 19(2) and Article 37 shall not be applicable to the offer levels, unless decided otherwise by the relevant national regulatory authorities.
5. Where implicit capacity allocation methods are applied, national regulatory authorities may decide not to apply Articles 8 to 37.
6. In order to prevent foreclosure of downstream supply markets, national regulatory authorities may, after consulting network users, decide to take proportionate measures to limit up-front bidding for capacity by any single network user at interconnection points within a **Contracting Party**.

### **Article 3**

#### **Definitions**

For the purposes of this Regulation, the definitions **and rules** in Article 2 of Regulation (EC) No 715/2009, Article 3 **and Article 24** of Commission Regulation (EU) 2017/460 and Article 2 Directive 2009/73/EC shall apply. In addition, the following definitions shall apply:

1. 'incremental capacity' means a possible future increase via market-based procedures in technical capacity or possible new capacity created where none currently exists that may be offered based on investment in physical infrastructure or long-term capacity optimisation and subsequently allocated subject to the positive outcome of an economic test, in the following cases:
  - (a) at existing interconnection points;
  - (b) by establishing a new interconnection point or points;
  - (c) as physical reverse flow capacity at an interconnection point or points, which has not been offered before;
2. 'interconnection point' means a physical or virtual point connecting adjacent entry-exit systems or connecting an entry-exit system with an interconnector, in so far as these points are subject to booking procedures by network users;
3. 'alternative allocation mechanism' means an allocation mechanism for offer level or incremental capacity designed on a case-by-case basis by the transmission system operators, and approved by the national regulatory authorities, to accommodate conditional demand requests;
4. 'standard capacity product' means a certain amount of transport capacity over a given period of time, at a specified interconnection point;
5. 'offer level' means the sum of the available capacity and the respective level of incremental capacity offered for each of the yearly standard capacity products at an interconnection point;
6. 'implicit allocation method' means a capacity allocation method where, possibly by means of an auction, both transmission capacity and a corresponding quantity of gas are allocated at the same time;
7. 'bidding round' means the period of time during which network users can submit, amend and withdraw bids;
8. 'large price step' means a fixed or variable amount that is defined per interconnection point and standard capacity product;
9. 'incremental capacity project' means a project to increase the amount of technical capacity at an existing interconnection point or to establish a new interconnection point based on capacity allocation in the preceding incremental capacity process;
10. 'economic test' means a test applied to assess the economic viability of incremental capacity projects;
11. 'incremental capacity process' means a process to assess the market demand for incremental capacity that includes a non-binding phase, in which network users express and quantify their demand for incremental capacity, and a binding phase, in which binding commitments for contracting capacity are requested from network users by one or more transmission system operators;

12. 'bundled capacity' means a standard capacity product offered on a firm basis which consists of corresponding entry and exit capacity at both sides of every interconnection point;
13. 'interconnection agreement' means an agreement entered into by adjacent transmission system operators, whose systems are connected at a particular interconnection point, which specifies terms and conditions, operating procedures and provisions, in respect of delivery and/or withdrawal of gas at the interconnection point with the purpose of facilitating efficient interoperability of the interconnected transmission networks, as set out in Chapter II of Regulation (EU) 2015/703;
14. 'competing capacities' means capacities for which the available capacity at one point of the network cannot be allocated without fully or partly reducing the available capacity at another point of the network;
15. 'auction calendar' means a table displaying information relating to specific auctions which is published by ENTSOG <...> every calendar year for auctions taking place during the period of March until February of the following calendar year and consisting of all relevant timings for auctions, including starting dates and standard capacity products to which they apply;
16. 'gas day' means the period from 5.00 to 5.00 UTC the following day for winter time and from 4.00 to 4.00 UTC the following day when daylight saving is applied;
17. 'within-day capacity' means capacity offered and allocated after the closure of the day-ahead capacity auctions with respect to that day;
18. 'ascending clock auction' means an auction in which a network user places requested quantities against defined price steps, which are announced sequentially;
19. 'uniform-price auction' means an auction in which the network user in a single bidding round bids price as well as quantity and all network users, who are successful in gaining capacity, pay the price of the lowest successful bid;
20. 'reserve price' means the eligible floor price in the auction;
21. 'small price step' means a fixed or variable amount that is defined per interconnection point and standard capacity product which is smaller than the large price step;
22. 'first-time undersell' means an occurrence where the aggregate demand across all network users is less than the capacity offered at the end of the second bidding round or a subsequent bidding round;
23. 'virtual interconnection point' means two or more interconnection points which connect the same two adjacent entry-exit systems, integrated together for the purposes of providing a single capacity service;
24. 'f-factor' means the share of the present value of the estimated increase in the allowed or target revenue of the transmission system operator associated with the incremental capacity included in the respective offer level as set out in Article 22(1)(b) to be covered by the present value of binding commitments of network users for contracting capacity calculated as set out in Article 22(1)(a);
25. 'over-nomination' means the entitlement of network users who fulfil minimum requirements for submitting nominations to request interruptible capacity at any time within-day by submitting a nomination which increases the total of their nominations to a level higher than their contracted capacity.
- 26. 'protected customers' means all household customers who is connected to a gas distribution network and, in addition, where the Contracting Party concerned so decides, may also mean one or more of the following, provided that enterprises or services as re-**

ferred to in points (a) and (b) do not, jointly, represent more than 20 % of the total annual final gas consumption in that Contracting Party

(a) small and medium-sized enterprises, provided that they are connected to a gas distribution network;(b) an essential social service, provided that it is connected to a gas distribution or transmission network;

(b) a district heating installation to the extent that it delivers heating to household customers, small or medium-sized enterprises, or essential social services, provided that such installation is not able to switch to other fuels than gas.

## CHAPTER II PRINCIPLES OF COOPERATION

### *Article 4*

#### **Coordination of maintenance**

Where maintenance of a pipeline or part of a transmission network has an impact on the amount of transmission capacity which can be offered at interconnection points, the transmission system operator(s) shall fully cooperate with their adjacent transmission system operator(s) regarding their respective maintenance plans in order to minimise the impact on potential gas flows and capacity at an interconnection point.

### *Article 5*

#### **Standardisation of communication**

1. Transmission system operators shall coordinate the implementation of standard communication procedures, coordinated information systems and compatible electronic on-line communications, such as shared data exchange formats and protocols, as well as agree principles as to how this data is treated.
2. Standard communication procedures shall include, in particular, those relating to network users' access to the transmission system operators' auction system or a relevant booking platform and the review of auction information provided. The timing and content of the data to be exchanged shall be compliant with the provisions set out in Chapter III.
3. The standard communication procedures adopted by transmission systems operators shall include an implementation plan and duration of applicability, which shall be in line with the development of booking platform(s) as set out in Article 37. Transmission systems operators shall ensure confidentiality of commercially sensitive information.

### *Article 6*

#### **Capacity calculation and maximisation**

1. The maximum technical capacity shall be made available to network users, taking into account system

integrity, safety and efficient network operation.

(a) In order to maximise the offer of bundled capacity through the optimisation of the technical capacity transmission system operators shall take the following measures at interconnection points, giving priority to those interconnection points where there is contractual congestion pursuant to point 2.2.3(1) of Annex I to Regulation (EC) No 715/2009: the transmission system operators shall establish and apply a joint method, setting out the specific steps to be taken by the respective transmission system operators to achieve the required optimisation:

(1) the joint method shall include an in-depth analysis of the technical capacities, including any discrepancies therein on both sides of an interconnection point, as well as the specific actions and detailed timetable — including possible implications and containing the regulatory approvals required to recover costs and adjust the regulatory regime — necessary to maximise the offer of bundled capacity. Such specific actions shall not be detrimental to the offer of capacity at other relevant points of the concerned systems and points to distribution networks relevant for security of supply to final customers, such as those to storage facilities, LNG terminals and protected customers <...>;

(2) the calculation methodology and the rules of making available the capacity, adopted by the transmission system operators, shall address specific situations where competing capacities across systems involve interconnection points and exit points to storage facilities;

(3) this in-depth analysis shall take into account assumptions made in the <...> 10-year network development plan **where applicable** <...>, national investment plans, relevant obligations under the applicable national laws and any relevant contractual obligations;

(4) the relevant transmission system operators shall apply a dynamic approach to re-calculating technical capacity, where appropriate in conjunction with the dynamic calculation applied for additional capacity on the basis of point 2.2.2.2 of Annex I to Regulation (EC) No 715/2009, jointly identifying the appropriate frequency for re-calculation per interconnection point and having regard to the particular specificities thereof;

(5) in the joint method, adjacent transmission system operators shall consult other transmission system operators specifically affected by the interconnection point;

(6) transmission system operators shall have regard to information that network users may provide with regard to expected future flows when re-calculating the technical capacity.

(b) the transmission system operators shall jointly assess at least the following parameters and where appropriate adjust them:

(1) pressure commitments;

(2) all relevant demand and supply scenarios, including details on reference climatic conditions and network configurations associated with extreme scenarios;

(3) calorific value.

2. Where the optimisation of technical capacity causes costs to the transmission system operators, particularly costs that unevenly impact transmission system operators on either side of an interconnection point, transmission system operators shall be allowed to recover such efficiently incurred costs via the regulatory framework established by the relevant regulatory authorities in accordance with Article 13 of Regulation (EC) No 715/2009 and Article 42 of Directive 2009/73/EC. <...>

**2a. For cross-border infrastructure, the Energy Community Regulatory Board shall decide upon those regulatory issues that fall within the competence of national regulatory authorities:**

**(a) where the competent national regulatory authorities have not been able to reach an agreement within a period of six months from when the case was referred to the last of those regulatory authorities; or**

**(b) upon a joint request from the competent national regulatory authorities.**

**The competent national regulatory authorities may jointly request that the period referred to in point (a) is extended by a period of up to six months.**

**When preparing its decision, the Energy Community Regulatory Board shall consult the national regulatory authorities and the transmission system operators concerned and shall be informed of the proposals and observations of all the transmission system operators concerned.**

**Where a case has been referred to the Energy Community Regulatory Board under paragraph (2a), the Energy Community Regulatory Board**

**(a) shall provide its decision within a period of 6 months from the day of referral; and**

**(b) may, if necessary, provide an interim decision to ensure that security of supply or operational security of the infrastructure in question is protected.**

3. Where appropriate, national regulatory authorities shall consult network users on the applied calculation method and joint approach.

4. Changes in the amount of bundled capacity offered at interconnection points as a result of the process pursuant to paragraph 1 shall be included in the report of the **Energy Community Regulatory Board** published pursuant to point 2.2.1(2) of Annex I to Regulation (EC) No 715/2009.

## **Article 7**

### **Exchange of information between adjacent transmission system operators**

1. Adjacent transmission system operators shall exchange nomination, re-nomination, matching and confirmation information at relevant interconnection points on a regular basis.

2. Adjacent transmission system operators shall exchange information about the maintenance of their individual transmission network in order to contribute to the decision making process with regard to the technical use of interconnection points. The procedures to exchange data between transmission system operators shall be integrated in their respective interconnection agreement.

## CHAPTER III

### ALLOCATION OF FIRM CAPACITY PRODUCTS

#### *Article 8*

#### **Allocation methodology**

1. Auctions shall be used for the allocation of capacity at interconnection points, except where the alternative allocation methodology pursuant to Article 30 is applied.
2. At all interconnection points the same auction design shall apply. The relevant auction processes shall start simultaneously for all concerned interconnection points. Each auction process, relating to a single standard capacity product, shall allocate capacity independently of every other auction process except where incremental capacity is offered or where, subject to the agreement of the directly involved transmission system operators and the approval of relevant national regulatory authorities, competing capacity is allocated. The national regulatory authority of any adjacent and affected **Contracting Party** or Member State may provide a position which shall be considered by the relevant national regulatory authority. In case incremental capacity is offered, the independent allocation shall not apply to the simultaneous auction processes for the respective offer levels, since these are dependent on each other, as only one offer level can be allocated.
3. The standard capacity products shall follow a logical order by which products covering yearly capacity shall be offered first, followed by the product with the next shortest duration for use during the same period. The timing of the auctions provided for in Articles 11 to 15 shall be consistent with this principle.
4. The rules on standard capacity products as set out in Article 9 and auctions as set out in Articles 11 to 15 shall apply to bundled capacity and unbundled capacity at an interconnection point.
5. For a given auction, the availability of the relevant standard capacity products shall be communicated in accordance with Articles 11 to 15 and according to the auction calendar.
6. An amount at least equal to 20% of the existing technical capacity at each interconnection point shall be set aside and offered in accordance with paragraph 7. If the available capacity is less than the proportion of technical capacity to be set aside, the whole of any available capacity shall be set aside. This capacity shall be offered in accordance with point (b) of paragraph 7, while any remaining capacity set aside shall be offered in accordance with point (a) of paragraph 7.
7. Any capacity set aside pursuant to paragraph 6 shall be offered, subject to the following provisions:
  - (a) an amount at least equal to 10% of the existing technical capacity at each interconnection point shall be offered no earlier than in the annual yearly capacity auction as provided for in Article 11 held in accordance with the auction calendar during the fifth gas year preceding the start of the relevant gas year; and
  - (b) a further amount at least equal to 10% of the existing technical capacity at each interconnection point shall first be offered no earlier than the annual quarterly capacity auction as provided for in Article 12, held in accordance with the auction calendar during the gas year preceding the start of the relevant gas year.
8. In the case of incremental capacity, an amount at least equal to 10% of the incremental technical capacity at the concerned interconnection point shall be set aside and offered no earlier than the

annual quarterly capacity auction as provided for in Article 12, held in accordance with the auction calendar during the gas year preceding the start of the relevant gas year.

9. The exact proportion of capacity to be set aside pursuant to paragraphs 6 and 8 shall be subject to a stakeholder consultation, alignment between transmission system operators and approval by national regulatory authorities at each interconnection point. National regulatory authorities shall in particular consider setting aside higher shares of capacity with a shorter duration to avoid foreclosure of downstream supply markets.

10. Capacity created via non-market based procedures and for which the final investment decision has been taken without prior commitments from network users shall be offered and allocated as available standard capacity products as set out in this Regulation.

### **Article 9**

#### **Standard capacity products**

1. Transmission system operators shall offer yearly, quarterly, monthly, daily and within-day standard capacity products.

2. Yearly standard capacity products shall be the capacity which may be applied for, in a given amount, by a network user for all gas days in a particular gas year (starting on 1 October).

3. Quarterly standard capacity products shall be the capacity which may be applied for, in a given amount, by a network user for all gas days in a particular quarter (starting on 1 October, 1 January, 1 April or 1 July respectively).

4. Monthly standard capacity products shall be the capacity which may be applied for, in a given amount, by a network user for all gas days in a particular calendar month (starting on the first day of each month).

5. Daily standard capacity products shall be the capacity which may be applied for, in a given amount, by a network user for a single gas day.

6. Within-day standard capacity products shall be the capacity which may be applied for, in a given amount, by a network user from a start time within a particular gas day until the end of the same gas day.

### **Article 10**

#### **Applied capacity unit**

The capacity offered shall be expressed in energy units per unit of time. The following units shall be used: kWh/h or kWh/d. In case of kWh/d a flat flow rate over the gas day is assumed.

### **Article 11**

#### **Annual yearly capacity auctions**

1. The yearly capacity auctions shall be held once a year.

2. Capacity for each yearly standard capacity product shall be auctioned through the annual yearly capacity auction using an ascending-clock auction algorithm in accordance with Article 17.

3. The auction process shall offer capacity at least for the upcoming 5 gas years and for no longer than the upcoming 15 gas years for existing capacity. When offering incremental capacity, the offer levels may be offered in yearly capacity auctions for a maximum of 15 years after the start of operational use.

4. As from **2020**, annual yearly capacity auctions shall start on the first Monday of July each year unless otherwise specified in the auction calendar.

5. During the annual yearly capacity auction network users shall be able to participate in one or several concurrent auctions in relation to each interconnection point in order to apply for standard capacity products.

6. The capacity to be offered during the annual yearly capacity auction shall be equal to:

$$\mathbf{A - B - C + D + E - F}$$

*Where:*

**A** is the transmission system operator's technical capacity for each of the standard capacity products;

**B** for annual yearly auctions offering capacity for the next 5 years, is the amount of technical capacity (A) set aside in accordance with Article 8(7); for annual yearly auctions for capacity beyond the first 5 years, is the amount of technical capacity (A) set aside in accordance with Article 8(7);

**C** is the previously sold technical capacity, adjusted by the capacity which is re-offered in accordance with applicable congestion management procedures;

**D** is additional capacity, for such year, if any.

**E** is the incremental capacity for such year included in a respective offer level, if any;

**F** is the amount of incremental capacity (E), if any, set aside in accordance with Article 8(8) and (9).

7. The capacity to be offered may be either bundled capacity or unbundled capacity in accordance with Article 19. This also applies to all other auctions as set out in Articles 12 to 15.

8. At least 1 month before the auction starts, transmission system operators shall notify network users about the amount of firm capacity to be offered for each year for the upcoming annual yearly capacity auction.

9. The bidding rounds of each auction shall take place between 8.00 UTC to 17.00 UTC (winter time) or 7.00 UTC to 16.00 UTC (daylight saving) on all relevant gas days. Bidding rounds shall be opened and closed within each gas day, as specified in Article 17(2).

10. The allocation results of the auction shall be made available, as soon as reasonably possible, and no later than the next business day after the closing of the bidding round, simultaneously to individual network users participating in the respective auction.

In case of incremental capacity, the binding commitments of network users for contracting capacity, including whether the conditions for a repeated auction pursuant to Article 29(3) are met, shall be made available no later than the next business day after the closing of the bidding round, simultaneously to individual network users participating in the respective auction. The results of the economic tests shall be made available no later than 2 business days after the closing of the bidding round, simultaneously to individual network users participating in the respective auction.

11. Aggregated information on auction results shall be published to the market.

**Article 12****Annual quarterly capacity auctions**

1. Four annual quarterly capacity auctions shall be held during each gas year.
2. Capacity for each quarterly standard capacity product shall be auctioned through the annual quarterly capacity auctions using an ascending-clock auction algorithm in accordance with Article 17.
3. Capacity for quarters of the upcoming gas year shall be auctioned via concurrent auctions for each quarter and in relation to each interconnection point as follows:
  - (a) for quarters one (October-December) through four (July-September) in the first annual quarterly capacity auction;
  - (b) for quarters two (January-March) through four (July-September) in the second annual quarterly capacity auction;
  - (c) for quarters three (April-June) through four (July-September) in the third annual quarterly capacity auction;
  - (d) for the last quarter (July-September) in the fourth annual quarterly capacity auction.
 For each annual quarterly auction network users shall be able to participate in all of the concurrent auctions.
4. Each gas year the annual quarterly capacity auctions shall start on the following days, unless otherwise specified in the auction calendar:
  - (a) the first annual quarterly capacity auctions shall start on the first Monday of August;
  - (b) the second annual quarterly capacity auctions shall start on the first Monday of November;
  - (c) the third annual quarterly capacity auctions shall start on the first Monday of February;
  - (d) the fourth annual quarterly capacity auction shall start on the first Monday of May.
5. The capacity to be offered in all annual quarterly capacity auctions shall be equal to:

$$A - C + D$$

*Where:*

- A** is the transmission system operator's technical capacity for each of the standard capacity products;
- C** is the previously sold technical capacity, adjusted by the capacity which is re-offered in accordance with applicable congestion management procedures;
- D** is additional capacity, for such quarter, if any.
6. Two weeks before the auctions start, transmission system operators shall notify network users about the amount of capacity to be offered for each quarter for the upcoming annual quarterly capacity auction.
  7. The bidding rounds of each auction, shall take place between 8.00 UTC to 17.00 UTC (winter time) or 7.00 UTC to 16.00 UTC (daylight saving) on all relevant gas days. Bidding rounds shall be opened and closed within each gas day, as specified in Article 17(2).
  8. The allocation results of the auction shall be published, as soon as reasonably possible, and no later than the next business day after the closing of the bidding round, simultaneously to individual network users participating in the respective auction.
  9. Aggregated information on the auction results shall be published to the market.

### **Article 13**

#### **Rolling monthly capacity auctions**

1. The rolling monthly capacity auction shall be held once a month.
2. Capacity for each monthly standard capacity product shall be auctioned through the rolling monthly capacity auction using an ascending-clock auction algorithm according to Article 17. Each month, the monthly standard capacity product for the following calendar month shall be auctioned.
3. During the rolling monthly capacity auction network users shall be able to apply for one monthly standard capacity product.
4. Rolling monthly capacity auctions shall start on the third Monday of each month for the following monthly standard capacity product unless otherwise specified in the auction calendar.
5. The capacity to be offered in the rolling monthly capacity auction shall be, each month, equal to:

$$\mathbf{A - C + D}$$

*Where:*

- A** is the transmission system operator's technical capacity for each of the standard capacity products;
- C** is the previously sold technical capacity, adjusted by the capacity which is re-offered in accordance with applicable congestion management procedures;
- D** is additional capacity, for such month, if any.
6. One week before the auction starts, transmission system operators shall notify network users about the amount of capacity to be offered for the upcoming rolling monthly capacity auction.
  7. The bidding rounds of each auction shall take place between 8.00 UTC to 17.00 UTC (winter time) or 7.00 UTC to 16.00 UTC (daylight saving) on all relevant gas days. Bidding rounds shall be opened and closed within each gas day, as specified in Article 17(2).
  8. The allocation results of the auction shall be published, as soon as reasonably possible, and no later than the next business day after the closing of the bidding round, simultaneously to individual network users participating in the respective auction.
  9. Aggregated information on the auction results shall be published to the market.

### **Article 14**

#### **Rolling day-ahead capacity auctions**

1. The rolling day-ahead capacity auction shall be held once a day.
2. Every day, a standard capacity product for the following gas day shall be auctioned through the rolling day-ahead capacity auction.
3. Capacity for each daily standard capacity product shall be auctioned through the rolling day-ahead capacity auction using a uniform price auction algorithm according to Article 18. Each day, the daily standard capacity product for the following gas day shall be auctioned.
4. During the rolling day-ahead capacity auction network users shall be able to apply for capacity for

one daily standard capacity product.

5. The bidding round shall open every day at 15.30 UTC (winter time) or 14.30 UTC (daylight saving).
6. A capacity bid for the daily standard capacity product for the rolling day-ahead capacity auction shall be handled as follows: submission, withdrawal or amendment from 15.30 UTC to 16.00 UTC (winter time) or 14.30 UTC to 15.00 UTC (daylight saving).
7. The capacity to be offered in the rolling day-ahead capacity auction shall be, each day, equal to:

$$A - C + D$$

*Where:*

- A** is the transmission system operator's technical capacity for each of the standard capacity products;
  - C** is the previously sold technical capacity, adjusted by the capacity which is re-offered in accordance with applicable congestion management procedures;
  - D** is additional capacity, for such day, if any.
8. At the time the bidding round opens, transmission system operators shall notify network users about the amount of capacity to be offered for the upcoming rolling day-ahead capacity auction.
  9. The allocation results of the auction shall be published, no later than 30 minutes after the closing of the bidding round, simultaneously to individual network users participating in the respective auction.
  10. Aggregated information on the auction results shall be published to the market.

### **Article 15**

#### **Within-day capacity auctions**

1. Subject to capacity being made available, a within-day capacity auction shall be held every hour during gas day using a uniform price auction algorithm in accordance with Article 18.
2. The first bidding round shall open directly on the next hour bar following the publication of results of the last day-ahead auction (including interruptible capacity if offered) in accordance with Article 14. The first bidding round closes at 1.30 UTC (winter time) or 0.30 UTC (daylight saving) before the gas day. The allocation of successful bids shall be effective from 5.00 UTC (winter time) or 4.00 UTC (daylight saving) on the relevant gas day.
3. The last bidding round shall close at 0.30 UTC (winter time) or 23.30 UTC (daylight saving) on the relevant gas day.
4. Network users shall be entitled to place, withdraw or amend bids from the opening of each bidding round until closure of that bidding round.
5. Each hour on the relevant gas day, capacity effective from the hour + 4 shall be auctioned as within-day capacity.
6. Each bidding round shall open at the start of every hour on the relevant gas day.
7. The duration of each bidding round shall be 30 minutes as of the opening of the bidding round.
8. The capacity to be offered in the within-day capacity auction shall be, each hour, equal to:

$$A - C + D$$

*Where:*

- A** is the transmission system operator's technical capacity for each of the standard capacity products;
  - C** is the previously sold technical capacity, adjusted by the capacity which is re-offered in accordance with applicable congestion management procedures;
  - D** is additional capacity, if any.
9. Transmission system operators shall publish the available amount of within-day firm capacity on offer, after closure of the last day-ahead auction and in accordance with Article 32(9).
  10. Transmission system operators shall provide network users who bid in the day-ahead auctions with the option to have valid unsuccessful bids automatically entered into the subsequent within-day auction.
  11. The capacity shall be allocated within 30 minutes of the closure of the bidding round provided that the bids are accepted and the transmission system operator runs the allocation process.
  12. The results of the auction shall be made available simultaneously to individual network users.
  13. Aggregated information on the auction results shall be published at least at the end of each day.

### **Article 16**

#### **Auction algorithms**

1. If several standard capacity products are offered during an auction, the respective allocation algorithm shall be applied separately for each standard capacity product when it is being allocated. Bids for the different standard capacity products shall be considered independently from each other in the application of the auction algorithm.
2. For annual yearly, annual quarterly and rolling monthly capacity auctions, an ascending clock auction algorithm, with multiple bidding rounds, as provided for in Article 17, shall be applied.
3. For rolling day-ahead capacity auctions and within-day capacity auctions, a uniform-price auction algorithm, with a single bidding round, shall be applied in accordance with Article 18.

### **Article 17**

#### **Ascending clock auction algorithm**

1. Ascending clock auctions shall enable network users to place volume bids against escalating prices announced in consecutive bidding rounds, starting at the reserve price  $P_0$ .
2. The first bidding round, with an associated price equal to the reserve price  $P_0$ , shall have a duration of 3 hours. Subsequent bidding rounds shall have a duration of 1 hour. There shall be a period of 1 hour between bidding rounds.
3. A bid shall specify:
  - (a) the identity of the network user applying;
  - (b) the concerned interconnection point and direction of the flow;
  - (c) the standard capacity product for which the capacity is applied for;

- (d) per price step, the amount of capacity for the respective standard capacity product applied for;
- (e) where incremental capacity is offered, the concerned offer level.
4. A bid shall be considered valid if it is submitted by a network user and complies with all provisions of this Article.
5. In order for network users to participate in an auction, it shall be mandatory for network users to place a volume bid in the first bidding round.
6. Transmission system operators shall provide network users with the option to enter bids automatically against any price step.
7. Once the relevant bidding round closes, no modification, withdrawal or variation to valid bids shall be accepted. All valid bids shall become binding commitments of a network user to book capacity to the amount requested per announced price, provided the clearing price of the auction is that which is announced in the relevant bidding round.
8. The volume bid in any bidding round per network user shall be equal or smaller to the capacity offered in a specific auction. The volume bid per network user at a specific price shall be equal to or less than the volume bid placed by this network user in the previous round, except where paragraph 16 applies.
9. Bids may be freely entered, modified and withdrawn during a bidding round, providing all bids comply with paragraph 8. Valid bids shall remain valid until modified or withdrawn.
10. A large price step and a small price step shall be defined per interconnection point and per standard capacity product and shall be published in advance of the relevant auction. The small price step shall be set such that an increase by an integer number of small price steps is equal to an increase by a large price step.
11. The determination of the large price step shall seek to minimise, as far as reasonably possible, the length of the auction process. The determination of the small price step shall seek to minimise, as far as reasonably possible, the level of unsold capacity where the auction closes at a price higher than the reserve price.
12. If the aggregate demand across all network users is less than or equal to the capacity offered at the end of the first bidding round, the auction shall close.
13. If the aggregate demand across all network users is greater than the capacity offered at the end of the first bidding round or a subsequent bidding round, a further bidding round shall be opened with a price equal to the price in the previous bidding round, plus the large price step.
14. If the aggregate demand across all network users is equal to the capacity offered at the end of the second bidding round or a subsequent bidding round, the auction shall close.
15. If a first-time undersell occurs, a price reduction shall take place and a further bidding round shall be opened. The further bidding round will have a price equal to the price applicable in the bidding round preceding the first-time undersell, plus the small price step. Further bidding rounds with increments of the small price step shall then be opened until the aggregate demand across all network users is less than or equal to the capacity offered, at which point the auction shall close.
16. The volume bid per network user in all bidding rounds where small price steps are applied shall be equal to or less than the volume bid placed by this network user in the bidding round which preceded the first-time undersell. The volume bid per network user for a specific small price step shall be equal to or smaller than the volume bid placed by this network user in the previous bidding round of small price

steps. The volume bid per network user in all bidding rounds where small price steps are applied shall be equal to or greater than the volume bid placed by this network user during the bidding round in which the first-time undersell occurred.

17. If the aggregate demand across all network users is greater than the capacity offered in the bidding round with a price equal to that which led to the first-time undersell, minus one small price step, the auction shall close. The clearing price shall be the price that led to the first-time undersell and the successful bids shall be those submitted during the original bidding round in which the first-time undersell occurred.

18. After each bidding round, the demand of all network users in a specific auction shall be published as soon as reasonably possible in an aggregated form.

19. The price announced for the last bidding round in which the auction closes shall be considered as the clearing price of the specific auction, except cases where paragraph 17 applies.

20. All network users who have placed valid volume bids at the clearing price shall be allocated the capacity according to their volume bids at the clearing price. Where incremental capacity is offered, the allocation of incremental capacity shall be subject to the outcome of the economic test according to Article 22. Successful network users shall pay the clearing price of the specific auction, which may be a fixed or a floating payable price approach set out in Article 24 of Regulation (EU) 2017/460, and any other possible charges applicable at the time when the capacity allocated to them can be used.

21. Following every closed auction, the final auction result including the aggregation of allocated capacities and the clearing price shall be published. Successful network users shall be informed about the amount of capacities they are allocated, individual information shall be communicated only to concerned parties. Where incremental capacity is allocated, this paragraph shall only apply to the auction results of the offer level offering the largest amount of capacity that resulted in a positive economic test according to Article 22(3).

22. If an ascending clock auction has not ended by the scheduled starting point (according to the auction calendar) of the next auction for capacity covering the same period, the first auction shall close and no capacity shall be allocated. The capacity shall be offered in the next relevant auction.

### **Article 18**

#### **Uniform-price auction algorithm**

1. In a uniform-price auction, there is a single bidding round in which the network user bids price as well as quantity.

2. During the bidding round of a given auction, network users may submit up to 10 bids. Each bid shall be treated independently from other bids. After the closure of the bidding round, remaining bids may not be modified or withdrawn.

3. A bid shall specify:

(a) the identity of the network user applying;

(b) the concerned interconnection point and direction of the flow;

(c) the standard capacity product for which the capacity is applied for;

(d) the amount of capacity for the respective standard capacity product applied for, which shall be equal

to or smaller than the capacity offered in a specific auction;

(e) the minimum amount of capacity for the respective standard capacity product which the network user is willing to be allocated according to the relevant algorithm in case the network user is not allocated the amount requested in accordance with point (d);

(f) the bid prices, which shall not be less than the reserve price applicable for the relevant standard capacity product, which the network user is willing to pay in respect of the capacity applied for. Bids with a bid price below the reserve price shall not be accepted.

4. The transmission system operator shall rank all bids relating to a given standard capacity product according to their bid price, the highest price ranking first.

5. All remaining bids at bidding round closing time shall be considered as binding on those network users that are allocated at least the minimum amount of capacity requested in accordance with point (e) of paragraph 3.

6. Following the ranking of the bids in accordance with paragraph 4, and subject to paragraphs 7 to 10, capacity shall be allocated to the bids in function of their price ranking. All bids for which capacity is allocated shall be considered as successful. After the allocation of capacity, the remaining unallocated capacity shall be reduced by such quantity.

7. Following the application of paragraph 6 and subject to paragraph 9, where the amount of capacity bid for by a network user exceeds the remaining unallocated capacity (after capacity has been allocated to network users placing higher bids), this network user shall be allocated capacity equal to the remaining unallocated capacity.

8. Following the application of paragraph 7 and subject to paragraph 9, where each of two or more bids specifies the same bid price, and the amount of relevant capacity remaining applied for in aggregate under such bids exceeds the remaining unallocated amount, the remaining unallocated amount shall be allocated pro rata to the amounts applied for in each such bid.

9. Where the amount to be allocated in respect of a bid pursuant to paragraphs 6, 7 or 8 is less than the minimum amount of capacity according to point (e) of paragraph 3, the bid shall be considered unsuccessful, and a revised allocation shall be made between remaining equal price bid(s) under paragraph 8, or an allocation shall be made in respect of the next priced bid, pursuant to paragraph 6.

10. Where the remaining amount to be allocated in respect of any bid pursuant to paragraphs 6, 7, 8 or 9 is equal to zero, no further capacity shall be allocated to the remaining bids. Those bids shall be considered unsuccessful.

11. The clearing price shall be defined as the price of the lowest successful bid, if the demand exceeds the offer at the reserve price. In all other cases, the clearing price shall be equal to the reserve price. Successful network users shall pay the clearing price of the specific auction, which may be a fixed or floating payable price approach as set out in Article 24 of Regulation (EU) 2017/460 and any other possible charges applicable at the time when the capacity allocated to them can be used.

## CHAPTER IV

### BUNDLING OF CAPACITY AT INTERCONNECTION POINTS

#### *Article 19*

#### **Bundled capacity products**

Adjacent transmission system operators shall jointly offer bundled capacity products, according to the following principles:

1. on both sides of an interconnection point all firm capacity shall be offered as bundled capacity, in so far as there is available firm or incremental capacity on both sides of the interconnection point;
2. transmission system operators shall offer capacity for the relevant standard capacity product on a booking platform, in accordance with Article 37 and in accordance with the applicable allocation procedure, as set out in Chapter III;
3. the bundled capacity to be offered by the transmission system operators concerned at an interconnection point shall be contracted through a single allocation procedure;
4. network users shall comply with applicable terms and conditions of the transport contract(s) of the transmission system operators concerned as from the time the transport capacity is contracted;
5. where there is more available firm capacity on one side of an interconnection point than on the other side for any period considered, the transmission system operator with the most available firm capacity may offer such extra capacity to the network users as an unbundled product in accordance with the auction calendar and the following rules:
  - (a) where there is an existing unbundled transport contract at the other side of the interconnection point, capacity may be offered on an unbundled basis not exceeding the amount and duration of the existing transport contract at the other side;
  - (b) where such extra capacity does not fall under point (a) of paragraph 5, it may be offered for a maximum period of 1 year;
6. any unbundled capacity allocated in accordance with paragraph 5 may be used and nominated as such. It may also be traded on the secondary market;
7. adjacent transmission system operators shall establish a joint nomination procedure for bundled capacity, providing network users with the means to nominate the flows of their bundled capacity via a single nomination;
8. the obligations to offer bundled capacity also apply, to the extent that they are relevant, to secondary capacity markets. Without prejudice to paragraph 1, capacity originally allocated as bundled capacity can only be resold as bundled capacity on the secondary market;
9. where two or more interconnection points connect the same two adjacent entry-exit systems, the adjacent transmission system operators concerned shall offer the available capacities at the interconnection points at one virtual interconnection point. In case more than two transmission system operators are involved because capacity in one or both entry-exit systems is marketed by more than one transmission system operator, the virtual interconnection point shall include all of these transmission system operators, to the extent possible. In all cases a virtual interconnection point shall be established only if

the following conditions are met:

(a) the total technical capacity at the virtual interconnection points shall be equal to or higher than the sum of the technical capacities at each of the interconnection points contributing to the virtual interconnection points;

(b) they facilitate the economic and efficient use of the system including but not limited to rules set out in Article 16 of Regulation (EC) No 715/2009.

Adjacent transmission system operators shall start the necessary analysis and shall establish functional virtual interconnection points no later than 1 November **2021**.

### **Article 20**

#### **Alignment of main terms and conditions for bundled capacity products**

<...>

4. <...> Transmission system operators, subject to the approval of national regulatory authority, may apply the terms and conditions set out in the template **published on ENTSOG's website covering contractual provisions which are not affected by fundamental differences in principles of national law or jurisprudence, for the offer of bundled capacity products** in the case of newly contracted bundled capacity products.

### **Article 21**

#### **Bundling in case of existing transport contracts**

1. The network users who are parties to unbundled transport contracts at respective interconnection points, shall aim to reach an agreement on the bundling of the capacity via contractual arrangements ('bundling arrangement'), in compliance with the provisions set out in Article 19. These network users and transmission system operators shall report to the relevant national regulatory authorities of all bundling arrangements reached by all parties to existing transport contracts.

2. The transmission system operators who are parties to the existing transport contracts may participate in the discussions regarding the bundling arrangement at any time, upon invitation of the network users who are parties to the existing transport contracts.

3. **Nine months after the expiry of the deadline for transposition of this Regulation**, transmission system operators shall offer network users holding mismatched unbundled capacity at one side of an interconnection point a free-of-charge capacity conversion service. Such a capacity conversion service shall apply to annual, quarterly or monthly capacity products for bundled firm capacity at that interconnection point which the network user had to acquire because insufficient unbundled capacity on the other side of the interconnection point was offered by an adjacent transmission system operator. This service shall be offered on a non-discriminatory basis and shall prevent additional charges from being applied to network users for capacity they already hold. In particular, payments for the part of the contracted bundled capacity which network users already hold as mismatched unbundled capacity shall be limited to a possible auction premium. This service shall be based on the conversion model **developed** by ENTSOG

<...>. The implementation may be facilitated by the capacity booking platform(s) referred to in Article 37. The use of this service shall be reported annually to the respective national regulatory authorities.

4. Where a bundling arrangement is agreed upon between respective network users, the transmission system operators involved at the interconnection point shall be informed by the parties of such intended bundling arrangement without undue delay and the transfer of the concerned capacity shall be implemented. In any case, the bundling arrangement shall be implemented subject to the applicable terms and conditions of existing related transport contracts. Once the bundling arrangement is implemented, the relevant capacity shall be treated as bundled capacity.

5. In any case, the duration of the bundling arrangements regarding the capacity bundled under the amendment of the existing contracts shall not exceed the duration of the original transport contracts.

6. All capacity shall be bundled at the earliest opportunity. Existing transport contracts for unbundled capacity cannot be renewed, prolonged or rolled over after their expiration date. Such capacity shall become available capacity as of the expiration date of the transport contracts.

## **CHAPTER V**

### **INCREMENTAL CAPACITY PROCESS**

#### ***Article 22***

#### **Economic test**

1. The economic test set out in this Article shall be carried out by the transmission system operator(s) or by the national regulatory authority, as decided by the national regulatory authority, for each offer level of an incremental capacity project after binding commitments of network users for contracting capacity have been obtained by the involved transmission system operators and shall consist of the following parameters:

(a) the present value of binding commitments of network users for contracting capacity, which is calculated as the discounted sum of the following parameters:

(i) the sum of the respective estimated reference prices and a potential auction premium and a potential mandatory minimum premium multiplied by the amount of contracted incremental capacity;

(ii) the sum of a potential auction premium and a potential mandatory minimum premium multiplied by the amount of available capacity that was contracted in combination with the incremental capacity;

(b) the present value of the estimated increase in the allowed or target revenue of the transmission system operator associated with the incremental capacity included in the respective offer level, as approved by the relevant national regulatory authority in accordance with Article 28(2);

(c) the f-factor.

2. The outcome of the economic test application shall be:

(a) positive, where the value of the parameter set out in paragraph 1(a) is at least equal to the share of the parameter set out in paragraph 1(b) as defined by the f-factor;

(b) negative, where the value of the parameter set out in paragraph 1(a) is lower than the share of the

parameter set out in paragraph 1(b) as defined by the f-factor.

3. An incremental capacity project shall be initiated if the economic test has a positive outcome on both sides of an interconnection point for at least one offer level that includes incremental capacity. In case more than one offer level results in a positive outcome of the economic test, the offer level with the largest amount of capacity that resulted in a positive outcome shall be used for proceeding with the incremental capacity project towards commissioning. In case no offer level results in a positive outcome, the specific incremental capacity process shall be terminated.

### **Article 23**

#### **The f-factor**

1. When applying the economic test referred to in Article 22, the national regulatory authority shall set the level of the f-factor for a given offer level, taking into account the following:

- (a) the amount of technical capacity set aside in accordance with Article 8(8) and (9);
- (b) positive externalities of the incremental capacity project on the market or the transmission network, or both;
- (c) the duration of binding commitments of network users for contracting capacity compared to the economic life of the asset;
- (d) the extent to which the demand for the capacity established in the incremental capacity project can be expected to continue after the end of the time horizon used in the economic test.

2. If the economic test has a positive outcome then the investment costs associated with the incremental capacity shall be reflected in an increase in the allowed or target revenue in accordance with the applicable national rules.

### **Article 24**

#### **Combination into single economic test**

1. In order to facilitate the offer of bundled capacity products, individual economic test parameters of the involved transmission system operators for a given offer level shall be combined into a single economic test.

2. The single economic test shall consist of the following parameters:

- (a) the present value of binding commitments of network users for contracting bundled capacity, which is the sum of the values according to Article 22(1)(a) of the involved transmission system operators;
- (b) the sum of the individual present values of the estimated increase in the allowed or target revenue of the involved transmission system operators that is attributable to the incremental capacity of a respective offer level;
- (c) the f-factor that defines the share of the parameter set out in point (b) that needs to be covered by the parameter set out in point (a) and allows all the involved transmission system operators individually to cover their upfront defined respective shares.

3. The outcome of the single economic test application shall be positive where all underlying economic tests result in positive outcomes as set out in Article 22(2)(a) taking into account a possible redistribution of revenues according to paragraphs 4 and 5. Otherwise, the outcome of the single economic test application shall be negative.

4. In case a redistribution of revenues could potentially lead to a decrease in the level of binding commitments of network users for contracting capacity required for a positive single economic test outcome, transmission system operators may submit to the relevant national regulatory authorities for coordinated approvals the mechanisms for a redistribution of revenues from incremental capacity.

5. A redistribution of revenues may be carried out as follows:

- (a) during the process of integrating the individual economic test parameters into a single economic test;
- (b) in case the single economic test has a negative outcome while at the same time the level of binding commitment of network users for contracting capacity exceeds the minimum required to cover the individual present value of the increase in the allowed or target revenue for at least one of the involved transmission system operators.

### **Article 25**

#### **Publication requirements relating to the economic test**

1. For a given incremental capacity project, the transmission system operator(s) shall submit to the relevant national regulatory authority(-ies) for approval the following information for each offer level:

- (a) the reference prices estimated for the time horizon of the initial offer of incremental capacity that are used for the calculation of the parameter set out in Article 22(1)(a) and 24(2)(a), respectively in case separate or a single economic test is applied;
- (b) the parameters set out in Article 22(1)(b) to (c) and 24(2)(b) to (c), respectively in case separate or a single economic test is applied;
- (c) if applicable, the range of the level for the mandatory minimum premium referred to in Article 33(4) of Regulation (EU) 2017/460 for each offer level and interconnection point applied in the first auction and possibly in subsequent auctions in which the incremental capacity is offered as defined in Article 33(3) of Regulation (EU) 2017/460.

2. Following the approval by the relevant national regulatory authority(-ies), the information set out in paragraph 1 shall be published by the involved transmission system operator(s) as set out in Article 28(3).

### **Article 26**

#### **Market demand assessment**

1. Immediately after the start of the annual yearly capacity auction at least in each odd-numbered year, transmission system operators shall cooperate in the processes of assessing market demand for incremental capacity and of conducting technical studies for incremental capacity projects for their joint interconnection points. The first demand assessment shall be conducted in **2021**.

2. No later than 8 weeks after the start of the annual yearly capacity auction at least in each odd-numbered year, the concerned transmission system operators on each side of an entry-exit system border shall produce common market demand assessment reports, each covering all interconnection points of at least one entry-exit system border. The market assessment report shall evaluate the prospective demand for incremental capacity of all network users pursuant to paragraph 8 and shall state whether an incremental capacity project is initiated.
3. The market demand assessment report shall be published in one or more official languages of the **Contracting Party** and to the extent possible in English on the websites of the concerned transmission system operators no later than 16 weeks after the start of the annual yearly capacity auction at least in each odd-numbered year.
4. **Transmission system operators**, shall **complete** the demand assessment reports **based on the** standard template **developed by ENTSOG** and publish the reports on **their** website.
5. If demand for incremental capacity is expressed by network users no later than 8 weeks after the start of the annual yearly auction in even-numbered years, the concerned transmission system operators may agree to conduct a market demand assessment also in an even-numbered year, provided that:
- (a) the process set out in Articles 26-30 can be concluded before the start of the next demand assessment cycle referred to in paragraph 1; and
  - (b) the auction calendar is respected.
6. Transmission system operators shall consider non-binding demand indications submitted no later than 8 weeks after the start of the annual yearly auction in the ongoing market demand assessment.
7. Transmission system operators may consider non-binding demand indications submitted after the deadline set out in paragraph 6 in the ongoing market demand assessment, or introduce them into the next market demand assessment.
8. The non-binding demand indications referred to in paragraphs 6 and 7 shall contain at least the following information:
- (a) the two or more adjacent entry-exit systems between which demand for incremental capacity — on one or both sides of an interconnection point — is expressed and the requested direction;
  - (b) the gas year(s) for which a demand for incremental capacity is expressed;
  - (c) the amount of capacity demanded between the respective entry-exit systems;
  - (d) information on non-binding demand indications which were or will be submitted to other transmission system operators, in case such indications are linked to each other, such as demand for capacities at several related interconnection points;
9. Network users shall indicate whether their demand is subject to any conditions in relation to points (a) to (d) of paragraph 8.
10. Transmission system operators shall respond to non-binding demand indications within 16 weeks after the start of the annual yearly auctions, or within 8 weeks of receipt of demand indications in accordance with paragraph 7. The response shall provide at least the following:
- (a) whether the demand indicated can be considered by the transmission system operator in the ongoing process; or
  - (b) whether, in the case of demand indications in accordance with paragraph 7, they are sufficient to

consider the initiation of an incremental capacity process according to paragraph 5; or

(c) in which market demand assessment report, according to paragraph 3, the indicated demand will be assessed, provided that the demand indicated cannot be considered under points (a) or (b), which is to be justified.

11. A transmission system operator may charge fees for activities resulting from the submission of non-binding demand indications. Such fees shall reflect the administrative costs for submitting demand indications, and shall be subject to approval by the relevant national regulatory authority and published on the transmission system operator's website. Such fees shall be reimbursed to the respective network user if the economic test for at least one offer level that includes incremental capacity at the respective interconnection point is positive.

12. The market demand assessment report shall take into account all of the following criteria:

(a) whether the <...> 10-year network development plan, **where applicable**, identifies a physical capacity gap whereby a specific region is undersupplied in a reasonable peak scenario and where offering incremental capacity at the interconnection point in question could close the gap; or a national network development plan identifies a concrete and sustained physical transport requirement;

(b) whether no yearly standard capacity product linking two adjacent entry-exit systems is available in the annual yearly capacity auction for the year in which incremental capacity could be offered for the first time and in the 3 subsequent years, because all the capacity has been contracted;

(c) whether network users submitted non-binding demand indications requesting incremental capacity for a sustained number of years and all other economically efficient means for maximising the availability of existing capacity are exhausted.

13. The market demand assessment report shall include at least the following:

(a) a conclusion on whether to initiate an incremental capacity project;

(b) the aggregated non-binding demand indications received no later than 8 weeks after the start of the annual yearly capacity auction in the year of the publication of the respective demand assessment report;

(c) the aggregated non-binding demand indications submitted after the deadline referred to in paragraph 6 during the previous incremental capacity process in case these demand indications were not considered for the previous demand assessment;

(d) the aggregated non-binding demand indications submitted in accordance with paragraph 7 where the transmission system operators has decide to consider them in the ongoing market demand assessment;

(e) an assessment of the expected amount, direction and duration of demand for incremental capacity at the interconnection points with each adjacent entry-exit system or interconnectors;

(f) a conclusion on whether technical studies for incremental capacity projects will be conducted, specifying for which interconnection points and for which expected demand level;

(g) provisional timelines for the incremental capacity project, technical studies and the consultation referred to in Article 27(3);

(h) a conclusion on what fees, if any, will be introduced, according to paragraph 10;

(i) the types and, where available the aggregated size of conditional demand indications according to point paragraph 9;

(j) how transmission system operators intend to apply Article 11(3) with regards to limitation of the

number of years being offered in the annual yearly capacity auctions during the incremental process.

14. Transmission system operators and the relevant national regulatory authorities shall publish respective points of contact for incremental capacity projects initiated at the publication of the market demand assessment report and update this information on a regular basis throughout the project.

### **Article 27**

#### **Design phase**

1. The day after the publication of the market demand assessment report, the design phase shall start, if the demand assessment report identifies demand for incremental capacity projects.

2. Transmission system operators active at the respective interconnection point shall conduct technical studies for incremental capacity projects in order to design the incremental capacity project and coordinated offer levels based on technical feasibility and the market demand assessment reports.

3. No later than 12 weeks after the start of the design phase, the concerned transmission system operators shall conduct a joint public consultation on the draft project proposal in one or more official languages of the **Contracting Party** and to the extent possible in English for a minimum of 1 month and no longer than 2 months. These operators shall take all reasonable steps to ensure cross-border coordination.

The consultation shall cover at least the following elements:

- (a) a description of the incremental capacity project, including a cost estimate;
- (b) the offer levels for bundled capacity products at the interconnection point;
- (c) where relevant, based on conditional demand indications received, the transmission system operators' proposed alternative allocation mechanism including its justification;
- (d) provisional timelines of the incremental capacity project;
- (e) general rules and conditions that a network users must accept to participate and access capacity in the binding capacity allocation phase of the incremental capacity process, including any collateral to be provided by network users and how possible delays in the provision of capacity or the event of a disruption to the project are dealt with contractually;
- (f) where a fixed price approach is followed for the incremental capacity project, the elements IND and RP described in Article 24(b) of Regulation (EU) 2017/460.
- (g) the level of user commitments, expressed as an estimate of the f-factor as applied in accordance with Article 23, which, after having consulted with the transmission system operators, is proposed and subsequently approved by the concerned national regulatory authorities;
- (h) any additional demand indications received in accordance with Article 26(7);
- (i) whether the incremental capacity is likely to result in a sustained, significant decrease in the utilisation of other non-depreciated gas infrastructure in the same and adjacent entry-exit systems or along the same gas transport route.

4. In the process of designing coordinated offer levels, the transmission system operators shall closely cooperate with the involved national regulatory authorities and coordinate across borders in order to enable offers of incremental capacity as bundled products. The project proposal and design of coor-

minated offer levels shall take into account the results of the consultation provided for in paragraph 3.

## **Article 28**

### **Approval and publication**

1. Following the consultation and finalisation of the design phase for an incremental capacity project in accordance with Article 27, the involved transmission system operators shall submit the project proposal for an incremental capacity project to the relevant national regulatory authorities for coordinated approvals. The project proposal shall also be published by the involved transmission system operators in one or more official languages of the **Contracting Party** and to the extent possible in English and shall include at least the following information:

- (a) all offer levels, reflecting the range of expected demand for incremental capacity at the relevant interconnection points as a result of the processes provided for in paragraph 3 of Article 27 and Article 26;
- (b) the general rules and conditions that a network user must accept to participate and access capacity in the binding capacity allocation phase of the incremental capacity process, including any collaterals to be provided by network users and how possible delays in the provision of capacity or the event of a disruption to the project are dealt with contractually;
- (c) timelines of the incremental capacity project, including any changes since the consultation described in paragraph 3 of Article 27, and measures to prevent delays and minimise the impact of delays;
- (d) the parameters defined in Article 22(1);
- (e) whether an exceptionally extended time horizon for contracting capacity for an additional period of up to 5 years beyond the allocation of up to 15 years after the start of the operational use may be required, in accordance with Article 30;
- (f) where applicable, the proposed alternative allocation mechanism including its justification pursuant to Article 30(2) as well as the conditions approved by the transmission system operator for the binding phase pursuant to Article 30(3);
- (g) where a fixed price approach is followed for the incremental capacity project, the elements described in Article 24(b) of Regulation (EU) 2017/460 .

2. Within 6 months of receipt of the complete project proposal by the last of the relevant regulatory authorities, those national regulatory authorities shall publish coordinated decisions on the project proposal defined in paragraph 1 in one or more official languages of the **Contracting Party** and to the extent possible in English. The decisions shall include justifications. National regulatory authorities shall inform each other of the receipt of the project proposal and its completeness in order to determine the start of the 6 months period.

When preparing the national regulatory authority's decision, each national regulatory authority shall consider the views of the other national regulatory authorities involved. In any case national regulatory authorities shall take into account any detrimental effects on competition or the effective functioning of the internal gas market associated with the incremental capacity projects concerned.

If a relevant national regulatory authority objects to the submitted project proposal, it shall inform the other involved national regulatory authorities as soon as possible. In such a situation, all the national

regulatory authorities involved shall take all reasonable steps to work together and reach a common agreement.

Where the relevant national regulatory authorities cannot reach an agreement on the proposed alternative allocation mechanism within the 6 months period referred to in the first subparagraph, the **Energy Community Regulatory Board** shall decide on the alternative allocation mechanism to be implemented, following the process set out in Article **6(2a) of this Regulation**.

3. Upon the publication of the decisions of the relevant national regulatory authorities pursuant to paragraph 2 and no later than 2 months before the offer of incremental capacity in the annual yearly capacity auction, the transmission system operators shall publish jointly a notice in one or more official languages of the **Contracting Party** and to the extent possible in English including the following minimum information

- (a) the information defined in paragraph 1 as approved by the national regulatory authorities;
- (b) a template of the contract(s) related to the capacity offered.

### **Article 29**

#### **Auctioning of incremental capacity**

1. Subject to the completion of the steps provided for in Article 27, the involved transmission system operators shall offer the incremental capacity together with the respective available capacity in the annual yearly capacity auction as standard bundled products in ascending clock auctions according to Article 17 as a default and in accordance with Article 8(8) and (9) and Article 19.

2. The auctions for the respective offer levels shall be conducted in parallel and independently from each other in accordance with Article 17 and subject to Article 8(2). Only coordinated offer levels shall be auctioned.

3. In order to minimise potential auction premia and to achieve a positive economic test outcome for the highest possible offer level, a new auction may be initiated once and only if:

- (a) there were at least two offer levels set by the transmission system operators before the start of the auctions described in paragraph 2; and
- (b) at least one offer level was unsuccessful and resulted in a negative economic test; and
- (c) the next smaller offer level of the lowest unsuccessful offer level resulted in a positive economic test, and cleared with an auction premium for at least one yearly standard capacity product.

If these conditions are met, the new auction may be initiated for the lowest unsuccessful offer level referred in point (b).

4. If the new auction does not result in a positive economic test outcome, the allocation results of the original auction referred to in point (c) shall prevail in accordance with Articles 17(20) and (21).

### **Article 30**

#### **Principles for alternative allocation mechanisms**

1. An alternative allocation mechanism covers a maximum of 15 years after the start of operational use.

If the economic test could not be passed based on the 15 years' bookings, national regulatory authorities may exceptionally extend the time horizon by up to 5 additional years.

2. An alternative capacity allocation mechanism can be used, subject to national regulatory authorities' approval, where it is reasonable to conclude from the market demand assessment pursuant to Article 26 or the consultation defined in Article 27(3) that the ascending clock auction is not suitable and that the incremental capacity project fulfils both of the following conditions:

(a) it involves more than two entry-exit systems and bids are requested along several interconnection points during the allocation procedure;

(b) bids with a duration of more than 1 year are requested. 3. In an alternative allocation mechanism network users may submit binding conditional bids for contracting capacity subject to one or more of the following conditions specified by the transmission system operators in the approved project proposal pursuant to Article 28(1):

(a) commitments linking or excluding commitments at other interconnection points;

(b) commitments across a number of different yearly standard capacity products at an interconnection point;

(c) commitments conditional on the allocation of a specific or minimum amount of capacity.

4. The alternative allocation mechanism is subject to approvals by the concerned national regulatory authorities according to Article 28(2). The mechanism shall be transparent and non-discriminatory but may allow for the prioritisation of booking duration or bids for higher amounts of capacity for a yearly standard capacity product.

5. If either booking duration or bids for higher amounts of capacity are prioritised, national regulatory authorities shall decide on setting aside an amount of at least 10 % and up to 20 % of the technical capacity at each interconnection point when applying Article 8(8). Capacity set aside in this manner shall be offered in accordance with Article 8(7).

### **Article 31**

#### **Transitional arrangements**

In the case of incremental capacity projects initiated before the **expiry of the deadline for transposition of this Regulation in the Energy Community**, Articles 26 to 30 shall apply unless such projects have been granted the applicable approvals for capacity allocation by the respective national regulatory authorities before **4 month after expiry of the deadline for transposition of this Regulation in the Energy Community**.

## CHAPTER VI

### INTERRUPTIBLE CAPACITY

#### *Article 32*

#### **Allocation of interruptible services**

1. As from **9 months after the expiry of the deadline for transposition of this Regulation in the Energy Community**, transmission system operators may only offer standard capacity products for interruptible capacity of a duration longer than one day if the corresponding monthly, quarterly or yearly standard capacity product for firm capacity was sold at an auction premium, was sold out, or was not offered.
2. Transmission system operators shall offer a daily capacity product for interruptible capacity in both directions at interconnection points where the respective standard capacity product for firm capacity was sold out day-ahead or was not offered. At unidirectional interconnection points where firm capacity is offered only in one direction, transmission system operators shall offer at least a daily product for interruptible capacity in the other direction.
3. If interruptible capacity is offered, this shall not be detrimental to the amount of firm capacity on offer. Transmission system operators shall not set aside capacity that can be offered as firm capacity in order to offer it as interruptible capacity.
4. To the extent interruptible capacity products other than daily products are offered, the same standard capacity products for firm capacity shall also apply for interruptible capacity, in terms of duration of the products.
5. To the extent interruptible capacity is offered, it shall be allocated via an auction process with the exception of within-day interruptible capacity.
6. Within-day interruptible capacity shall be allocated by means of an over-nomination procedure.
7. Within-day interruptible capacity shall only be allocated when firm capacity, whether technical capacity or additional capacity, is sold out.
8. Where auctions are held for any interruptible products longer than within-day transmission system operators shall, if known, publish the amounts of interruptible capacity on offer before the start of the auction process.
9. If offered, interruptible capacity shall be allocated by means of a separate auction after firm capacity of equal duration has been allocated, but before the auction of firm capacity with a shorter duration starts, with the exception of within-day interruptible capacity.
10. If offered, interruptible capacity auctions shall be conducted in accordance with the same design principles and timescales as applied for firm capacity. The exact auction dates to be used for the interruptible capacity auctions shall be detailed within the auction calendar with the exception of within-day interruptible capacity. For the annual yearly, all annual quarterly and all rolling monthly capacity auctions, the transmission system operators shall notify network users about the amount of interruptible capacity to be offered one week before the auction starts. Where an auction of firm capacity has not closed on the scheduled start day for the interruptible auctions, the interruptible auctions shall open no later

than the next business day after the closing of the respective auctions of firm capacity. In such cases, any change in the offered amounts shall be notified at least 12 hours before the start of the respective interruptible capacity auction.

### **Article 33**

#### **Minimum interruption lead times**

1. Interruptible capacities shall have minimum interruption lead times, which shall be decided jointly by adjacent transmission system operators.
2. The default minimum interruption lead time for a given gas hour shall be 45 minutes after the start of the re-nomination cycle for that gas hour. Where two transmission system operators wish to shorten the lead time for interruptions, any related agreement entered into between the transmission system operators shall be subject to competent national regulatory authority approval.

### **Article 34**

#### **Coordination of interruption process**

The transmission system operator that initiates the interruption shall notify the relevant adjacent transmission system operator. Adjacent transmission system operators shall notify their respective affected network users as soon as possible, but with due regard to the reliability of the information.

### **Article 35**

#### **Defined sequence of interruptions**

1. The order in which interruptions shall be performed, if the total of nominations exceeds the quantity of gas that can flow at a certain interconnection point, shall be determined based on the contractual time stamp of the respective transport contracts on an interruptible basis. In case of an interruption, transport contract coming into force earlier shall prevail over transport contract coming into force later.
2. If, after applying the procedure provided for in paragraph 1, two or more nominations are ranked at the same position within the interruption order and the transmission system operator does not interrupt all of them, a pro rata reduction of these specific nominations shall apply.
3. To accommodate the differences between the various interruptible capacity services within the **Energy Community**, the adjacent transmission system operators shall implement and coordinate the joint procedures provided for in this Article on an interconnection point by interconnection point basis.

**Article 36****Reasons for interruptions**

Transmission system operators shall include reasons for interruptions either directly in their interruptible transport contracts or in the general terms and conditions that govern these contracts. Reasons for interruptions can include but are not limited to gas quality, pressure, temperature, flow patterns, use of firm contracts, maintenance, up- or downstream constraints, public service obligations and capacity management deriving from congestion management procedures.

**CHAPTER VII****CAPACITY BOOKING PLATFORMS****Article 37****Capacity booking platforms**

1. Transmission system operators shall apply this Regulation by offering capacity by means of one or a limited number of joint web-based booking platforms. Transmission system operators can operate such platforms themselves or via an agreed party that, where necessary, acts on behalf of them towards the network users.

2. Joint booking platforms shall apply the following rules:

(a) the rules and procedures for the offer and allocation of all capacity in accordance with Chapter III shall apply;

(b) the establishment of a process to offer firm bundled capacity in accordance with Chapter IV shall have priority;

(c) functionalities for network users to offer and obtain secondary capacity shall be provided;

(d) in order to use the services of the booking platforms network users shall accede to and be compliant with all applicable legal and contractual requirements that enable them to book and use capacity on the relevant transmission system operators' network under a transport contract;

(e) capacity at any single interconnection point or virtual interconnection point shall be offered at not more than one booking platform but a transmission system operator may offer capacity at different interconnection or virtual interconnection points through different booking platforms.

3. Within 6 months from **expiry of the deadline for transposition of this Regulation in the Energy Community** all transmission system operators shall reach a contractual agreement to use a single booking platform to offer capacity on the two sides of their respective interconnection points or virtual interconnection points. If no agreement is reached by the transmission system operators within that period, the matter shall be referred immediately by the transmission system operators to the respective national regulatory authorities. The national regulatory authorities shall then, within a period of a further 6 months from the date of referral, jointly select the single booking platform for a period not longer than 3 years. If the national regulatory authorities are not able to jointly select a single booking platform within

6 months from the date of referral, Article **(2a) of this Regulation** shall apply. The **Energy Community Regulatory Board** shall decide on the booking platform to be used, for a period not longer than 3 years, at the specific interconnection point or virtual interconnection point.

4. In case the selection of the booking platform at an interconnection point or virtual interconnection point was made either by the national regulatory authorities or by the **Energy Community Regulatory Board**, the transmission system operators shall reach a contractual agreement on the use of a booking platform at the latest by the end of the period referred to in the last sentence of paragraph 3, for which the selection was made by the national regulatory authorities or the **Energy Community Regulatory Board**. If no contractual agreement is reached, the procedure set out in paragraph 3 shall be resumed.

5. The establishment of one or a limited number of joint booking platforms shall facilitate and simplify capacity booking at interconnection points across the **Energy Community** for the benefit of network users. <...>

6. For increases in technical capacity, the allocation results shall be published on the booking platform which is used for auctioning existing capacity, and for new capacity created where none currently exists, on a joint booking platform agreed by the relevant transmission system operators.

## CHAPTER VIII FINAL PROVISIONS

### *Article 38*

#### Implementation monitoring

1. <...> **In context of its implementation monitoring responsibilities, the Secretariat** shall monitor and analyse how transmission system operators have implemented this Regulation <...>.

2. Transmission system operators shall submit to **the Secretariat** all information required by **the Secretariat** to comply with its obligations pursuant to paragraph 1 by **no later than 9 months after the expiry of the deadline for transposition of this Regulation**.

3. The confidentiality of commercially sensitive information shall be preserved by **the Secretariat**.

4. **Not later than two years after the expiry of the deadline for transposition of this Regulation**, the **Energy Community Regulatory Board** shall <...> report on the conditionalities stipulated in contracts for standard capacity products for firm capacity, having regard to their effect on efficient network use and the integration of the **Energy Community** gas markets. The **Energy Community Regulatory Board** shall be supported in its assessment by the relevant national regulatory authorities and transmission system operators.

### *Article 39*

### *Article 40*

<...>

## COMMISSION REGULATION (EU) 2017/460 of 16 March 2017 establishing a network code on harmonised transmission tariff structures for gas

Incorporated and adapted by Permanent High Level Group Decision 2018/07/PHLG-EnC of 28 November 2018.

*The adaptations made by Permanent High Level Group Decision 2018/07/PHLG-EnC are highlighted in **bold and blue**.*

Whereas:

(1) In line with Regulation (EC) No 715/2009, it is necessary to establish a network code on harmonised transmission tariff structures for gas, and set out the Union-wide rules which have the objectives of contributing to market integration, enhancing security of supply and promoting the interconnection between gas networks.

(2) A crucial step in reaching these objectives is to increase the transparency of transmission tariff structures and procedures towards setting them. Therefore, it is necessary to set out the requirements for publishing the information related to the determination of the revenues of transmission system operators and to the derivation of different transmission and non-transmission tariffs. These requirements should enable network users to understand better the tariffs set for both transmission services and non-transmission services, as well as how such tariffs have changed, are set and may change. Additionally, network users should be able to understand the costs underlying transmission tariffs and to forecast transmission tariffs to a reasonable extent. The transparency requirements set out in this Regulation further harmonise the rule laid down in point 3.1.2(a) of Annex I to Regulation (EC) No 715/2009.

(3) After the introduction of the concept of the entry-exit system by Regulation (EC) No 715/2009, transmission costs are no longer directly associated to one specific route as entry and exit capacity can be contracted separately, and network users can have gas transported from any entry to any exit point. Under this framework, the transmission system operator decides the most efficient way of flowing gas through the system.

Hence, in order to achieve and ensure a reasonable level of cost reflectivity and predictability in such a system, transmission tariffs need to be based on a reference price methodology using specific cost drivers. The guiding principles in order to apply a consistent and transparent reference price methodology should be set out. The obligation to consult on the proposed reference price methodology should be laid down. Where the proposed reference price methodology is other than the capacity weighted distance reference price methodology, the latter should serve as a counterfactual for comparison with the proposed reference price methodology.

(4) In order to avoid double charging for transmission to and from storage facilities, this Regulation should set a minimum discount acknowledging the general contribution to system flexibility and security of supply of such infrastructure. Storage facilities with direct access to the transmission systems of two or more transmission system operators in directly connected entry-exit systems, or simultaneously to a transmission system and a distribution system allow for transporting gas between directly connected systems. Applying a discount at entry points from or exit points to storage facilities

in cases where storage facilities are used to transport gas between directly connected systems would benefit these network users compared to other network users booking capacity products without a discount at interconnection points or using storage facilities to transport gas within the same system. This Regulation should introduce mechanisms to avoid such discrimination.

(5) In order to promote security of supply, the granting of discounts should be considered for entry points from LNG facilities, and at entry points from and exit points to infrastructure developed with the purpose of ending the isolation of Member States in respect of their gas transmission systems.

(6) Transmission system operators in certain entry-exit systems transport significantly more gas into other systems than for consumption into their own entry-exit system. Consequently, reference price methodologies should include safeguards required to shelter such captive customers from risks related to large transit flows.

(7) In order to promote stability of transmission tariffs for network users, to foster financial stability and to avoid detrimental effects on the revenue and cash flow positions of transmission system operators, principles for revenue reconciliation should be set out.

(8) In addition, rules should be set out on tariff principles for incremental capacity realised in a market-based manner according to the process set out in Articles 26 to 30 of Commission Regulation (EU) 2017/459. In case realisation of incremental capacity leads to a level of cross-subsidisation that cannot be justified, as captive customers would be exposed to a large share of the volume risk, this Regulation should introduce mechanisms to alleviate such risks.

(9) This Regulation should be applicable to the non-exempted part of major new infrastructures which have received an exemption pursuant to Article 36 of Directive 2009/73/EC of the European Parliament and of the Council from Article 41(6), (8) and (10) of that Directive. In cases where the specific nature of interconnectors has been acknowledged at European level by an exemption in accordance with Article 36 of Directive 2009/73/EC or by other means, national regulatory authorities should have the power to grant a derogation from requirements of this Regulation which would jeopardise the efficient operation of such interconnectors.

(10) This Regulation should be without prejudice to application of Union and national competition rules, in particular the prohibitions of restrictive agreements (Article 101 of the Treaty on the Functioning of the European Union) and of abuse of a dominant position (Article 102 of the Treaty on the Functioning of the European Union). The harmonised transmission tariff structures put in place should be designed in such a way as to avoid foreclosure of downstream supply markets.

(11) National regulatory authorities and transmission system operators should have regard to best practices and endeavours to harmonise processes for the implementation of this Regulation. Acting in accordance with Article 7 of Regulation (EC) No 713/2009 of the European Parliament and of the Council, the Agency for the Cooperation of Energy Regulators and the national regulatory authorities should ensure that rules on harmonised transmission tariff structures for gas are implemented across the Union in the most effective way.

(12) The measures provided for in this Regulation are in accordance with the opinion of the Committee established in accordance with Article 51 of Directive 2009/73/EC.

## CHAPTER I GENERAL PROVISIONS

### *Article 1*

#### **Subject matter**

This Regulation establishes a network code setting out the rules on harmonised transmission tariff structures for gas, including rules on the application of a reference price methodology, the associated consultation and publication requirements as well as the calculation of reserve prices for standard capacity products.

### *Article 2*

#### **Scope**

1. This Regulation shall apply to all entry points and all exit points of gas transmission networks with the exception of Chapters III, V, VI, Article 28, Article 31(2) and (3) and Chapter IX which shall apply only to interconnection points. Chapters III, V, VI, Article 28 and Chapter IX shall apply to entry points from third countries or exit points to third countries, or both, where the national regulatory authority takes a decision to apply Regulation (EU) 2017/459 at those points.

2. <...>

### *Article 3*

#### **Definitions**

For the purposes of this Regulation, the definitions in Article 2 of Regulation (EC) No 715/2009, Article 3 of **Commission** Regulation (EU) 2017/459, <...> , Article 2 of Commission Regulation (EU) 2015/703 as well as Article 2 of Directive 2009/73/EC shall apply. In addition, the following definitions shall apply:

- (1) 'reference price' means the price for a capacity product for firm capacity with a duration of one year, which is applicable at entry and exit points and which is used to set capacity-based transmission tariffs;
- (2) 'reference price methodology' means the methodology applied to the part of the transmission services revenue to be recovered from capacity-based transmission tariffs with the aim of deriving reference prices;
- (3) 'non-price cap regime' means a regulatory regime, such as the revenue cap, rate of return and cost plus regime, under which the allowed revenue for the transmission system operator is set in accordance with Article 41(6)(a) of Directive 2009/73/EC;
- (4) 'non-transmission services revenue' means the part of the allowed or target revenue which is recovered by non-transmission tariffs;

- (5) 'regulatory period' means the time period for which the general rules for the allowed or target revenue are set in accordance with Article 41(6)(a) of Directive 2009/73/EC;
- (6) 'transmission services revenue' means the part of the allowed or target revenue which is recovered by transmission tariffs;
- (7) 'transmission tariffs' means the charges payable by network users for transmission services provided to them;
- (8) 'intra-system network use' means transporting gas within an entry-exit system to customers connected to that same entry-exit system;
- (9) 'cross-system network use' means transporting gas within an entry-exit system to customers connected to another entry-exit system;
- (10) 'homogeneous group of points' means a group of one of the following types of points: entry interconnection points, exit interconnection points, domestic entry points, domestic exit points, entry points from storage facilities, exit points to storage facilities, entry points from liquefied natural gas facilities (hereinafter, referred to as 'LNG facilities'), exit points to LNG facilities and entry points from production facilities;
- (11) 'allowed revenue' means the sum of transmission services revenue and non-transmission services revenue for the provision of services by the transmission system operator for a specific time period within a given regulatory period which such transmission system operator is entitled to obtain under a non-price cap regime and which is set in accordance with Article 41(6)(a) of Directive 2009/73/EC;
- (12) 'transmission services' means the regulated services that are provided by the transmission system operator within the entry-exit system for the purpose of transmission;
- (13) 'non-transmission tariffs' means the charges payable by network users for non-transmission services provided to them;
- (14) 'target revenue' means the sum of expected transmission services revenue calculated in accordance with the principles set out in Article 13(1) of Regulation (EC) No 715/2009 and expected non-transmission services revenue for the provision of services by the transmission system operator for a specific time period within a given regulatory period under a price cap regime;
- (15) 'non-transmission services' means the regulated services other than transmission services and other than services **related to the balancing of the transmission network** that are provided by the transmission system operator;
- (16) 'multiplier' means the factor applied to the respective proportion of the reference price in order to calculate the reserve price for a non-yearly standard capacity product;
- (17) 'price cap regime' means a regulatory regime under which a maximum transmission tariff based on the target revenue is set in accordance with Article 41(6)(a) of Directive 2009/73/EC;
- (18) 'cost driver' means a key determinant of the transmission system operator's activity which is correlated to the costs of that transmission system operator, such as distance or technical capacity;
- (19) 'cluster of entry or exit points' means a homogeneous group of points or group of entry points or of exit points located within the vicinity of each other and which are considered as, respectively, one entry point or one exit point for the application of the reference price methodology;
- (20) 'flow scenario' means a combination of an entry point and an exit point which reflects the use of

the transmission system according to likely supply and demand patterns and for which there is at least one pipeline route allowing to flow gas into the transmission network at that entry point and out of the transmission network at that exit point, irrespective of whether the capacity is contracted at that entry point and that exit point;

(21) 'seasonal factor' means the factor reflecting the variation of demand within the year which may be applied in combination with the relevant multiplier;

(22) 'fixed payable price' means a price calculated in accordance with Article 24(b) where the reserve price is not subject to any adjustments;

(23) 'tariff period' means the time period during which a particular level of reference price is applicable, which minimum duration is one year and maximum duration is the duration of the regulatory period;

(24) 'regulatory account' means the account aggregating at least under- and over-recovery of the transmission services revenue under a non-price cap regime;

(25) 'auction premium' means the difference between the clearing price and the reserve price in an auction;

(26) 'floating payable price' means a price calculated in accordance with Article 24(a) where the reserve price is subject to adjustments such as revenue reconciliation, adjustment of the allowed revenue or adjustment of the forecasted contracted capacity.

#### **Article 4**

#### **Transmission and non-transmission services and tariffs**

1. A given service shall be considered a transmission services where both of the following criteria are met:

(a) the costs of such service are caused by the cost drivers of both technical or forecasted contracted capacity and distance;

(b) the costs of such service are related to the investment in and operation of the infrastructure which is part of the regulated asset base for the provision of transmission services.

Where any of the criteria set out in points (a) and (b) are not complied with, a given service may be attributed to either transmission or non-transmission services subject to the findings of the periodic consultation by the transmission system operator(s) or the national regulatory authority and decision by the national regulatory authority, as set out in Articles 26 and 27.

2. Transmission tariffs may be set in a manner as to take into account the conditions for firm capacity products.

3. The transmission services revenue shall be recovered by capacity-based transmission tariffs.

As an exception, subject to the approval of the national regulatory authority, a part of the transmission services revenue may be recovered only by the following commodity-based transmission tariffs which are set separately from each other:

(a) a flow-based charge, which shall comply with all of the following criteria:

(i) levied for the purpose of covering the costs mainly driven by the quantity of the gas flow;

(ii) calculated on the basis of forecasted or historical flows, or both, and set in such a way that it

is the same at all entry points and the same at all exit points;

(iii) expressed in monetary terms or in kind.

(b) a complementary revenue recovery charge, which shall comply with all of the following criteria:

(i) evied for the purpose of managing revenue under- and over-recovery;

(ii) calculated on the basis of forecasted or historical capacity allocations and flows, or both;

(iii) applied at points other than interconnection points;

(iv) applied after the national regulatory authority has made an assessment of its cost-reflectivity and its impact on cross-subsidisation between interconnection points and points other than interconnection points.

4. The non-transmission services revenue shall be recovered by non-transmission tariffs applicable for a given non-transmission service. Such tariffs shall be as follows:

(a) cost-reflective, non-discriminatory, objective and transparent;

(b) charged to the beneficiaries of a given non-transmission service with the aim of minimising cross-subsidisation between network users within or outside a **Contracting Party**, or both.

Where according to the national regulatory authority a given non-transmission service benefits all network users, the costs for such service shall be recovered from all network users.

## **Article 5**

### **Cost allocation assessments**

1. The national regulatory authority or the transmission system operator, as decided by the national regulatory authority, shall perform the following assessments and shall publish them as part of the final consultation referred to in Article 26:

(a) a cost allocation assessment relating to the transmission services revenue to be recovered by capacity-based transmission tariffs and based exclusively on the cost drivers of

(i) technical capacity; or

(ii) forecasted contracted capacity; or

(iii) technical capacity and distance; or

(iv) forecasted contracted capacity and distance;

(b) a cost allocation assessment relating to the transmission services revenue to be recovered by commodity-based transmission tariffs, if any, and based exclusively on the cost drivers of:

(i) the amount of gas flows; or

(ii) the amount of gas flows and distance. 2. The cost allocation assessments shall indicate the degree of cross-subsidisation between intra-system and cross-system network use based on the proposed reference price methodology.

3. The cost allocation assessment referred to in paragraph 1(a) shall be carried out as follows:

(a) the transmission services capacity revenue to be obtained from intra-system network use at both all entry points and all exit points shall be divided by the value of the relevant capacity cost driver(s) for

intra-system network use in order to calculate the intra-system capacity ratio, which is defined as a monetary unit per measurement unit, such as in euro per MWh/day, in accordance with the following formula:

$$\text{Ratio}_{\text{cap}}^{\text{intra}} = \frac{\text{Revenue}_{\text{cap}}^{\text{intra}}}{\text{Driver}_{\text{cap}}^{\text{intra}}}$$

Where:

**Revenue<sub>cap</sub><sup>intra</sup>** is the revenue, defined in a monetary unit such as the euro, which is obtained from capacity tariffs and charged for intra-system network use;

**Driver<sub>cap</sub><sup>intra</sup>** is the value of capacity-related cost driver(s) for intra-system network use, such as the sum of the average daily forecasted capacities contracted at each intra-system entry point and intra-system exit point, or cluster of points, and is defined in a measurement unit such as MWh/day.

(b) the transmission services capacity revenue to be obtained from cross-system network use at both all entry points and all exit points shall be divided by the value of the relevant capacity cost driver(s) for cross-system network use in order to calculate the cross-system capacity ratio, which is defined as a monetary unit per measurement unit, such as in euro per MWh/day, in accordance with the following formula:

$$\text{Ratio}_{\text{cap}}^{\text{cross}} = \frac{\text{Revenue}_{\text{cap}}^{\text{cross}}}{\text{Driver}_{\text{cap}}^{\text{cross}}}$$

Where:

**Revenue<sub>cap</sub><sup>cross</sup>** is the revenue, defined in a monetary unit such as the euro, which is obtained from capacity tariffs and charged for cross-system network use;

**Driver<sub>cap</sub><sup>cross</sup>** is the value of capacity-related cost driver(s) for cross-system network use, such as the sum of the average daily forecasted capacities contracted at each cross-system entry and exit point, or cluster of points, and is defined in a measurement unit such as MWh/day.

(c) the capacity cost allocation comparison index between the ratios referred to in points (a) and (b), which is defined in percentage, shall be calculated in accordance with the following formula:

$$\text{Comp}_{\text{cap}} = \frac{2 \times \left| \text{Ratio}_{\text{cap}}^{\text{intra}} - \text{Ratio}_{\text{cap}}^{\text{cross}} \right|}{\text{Ratio}_{\text{cap}}^{\text{intra}} + \text{Ratio}_{\text{cap}}^{\text{cross}}} \times 100 \%$$

4. The cost allocation assessment referred to in paragraph 1(b) shall be carried out as follows:

(a) the transmission services commodity revenue to be obtained from intra-system network use at both all entry points and all exit points shall be divided by the value of the relevant commodity cost driver(s) for intra-system network use in order to calculate the intra-system commodity ratio, which is defined as a monetary unit per measurement unit, such as in euro per MWh, in accordance with the following formula:

$$\text{Ratio}_{\text{comm}}^{\text{intra}} = \frac{\text{Revenue}_{\text{comm}}^{\text{intra}}}{\text{Driver}_{\text{comm}}^{\text{intra}}}$$

Where:

$\text{Revenue}_{\text{comm}}^{\text{intra}}$  is the revenue, defined in a monetary unit such as the euro, which is obtained from commodity tariffs and charged for intra-system network use;

$\text{Driver}_{\text{comm}}^{\text{intra}}$  is the value of commodity-related cost driver(s) for intra-system network use, such as the sum of the average daily forecasted flows at each intra-system entry and exit point, or cluster of points, and is defined in a measurement unit such as MWh.

(b) the transmission services commodity revenue to be obtained from cross-system network use at both all entry points and all exit points shall be divided by the value of the relevant commodity cost driver(s) for cross-system network use in order to calculate the cross-system commodity ratio, which is defined as a monetary unit per measurement unit, such as in euro per MWh, in accordance with the following formula:

$$\text{Ratio}_{\text{comm}}^{\text{cross}} = \frac{\text{Revenue}_{\text{comm}}^{\text{cross}}}{\text{Driver}_{\text{comm}}^{\text{cross}}}$$

Where:

$\text{Revenue}_{\text{comm}}^{\text{cross}}$  is the revenue, defined in a monetary unit such as the euro, which is obtained from commodity tariffs and charged on cross-system network use;

$\text{Driver}_{\text{comm}}^{\text{cross}}$  is the value of commodity-related cost driver(s) for cross-system network use, such as the sum of the average daily forecasted flows at each cross-system entry and exit point, or cluster of points, and is defined in a measurement unit such as MWh.

(c) the commodity cost allocation comparison index between the ratios referred to in points (a) and (b), which is defined in percentage, shall be calculated in accordance with the following formula:

$$\text{Comp}_{\text{comm}} = \frac{2 \times |\text{Ratio}_{\text{comm}}^{\text{intra}} - \text{Ratio}_{\text{comm}}^{\text{cross}}|}{\text{Ratio}_{\text{comm}}^{\text{intra}} + \text{Ratio}_{\text{comm}}^{\text{cross}}} \times 100 \%$$

5. The transmission services revenue to be obtained from intra-system network use at entry points referred to in paragraphs 3(a) and 4(a) shall be calculated as follows:

(a) the amount of allocated capacity or, respectively, flows attributed to the provision of transmission services for cross-system network use at all entry points shall be deemed equal to the amount of capacity

or, respectively, flows attributed to the provision of transmission services for cross-system network use at all exit points;

(b) the capacity and, respectively, flows, determined as set out in point (a) of this paragraph shall be used to calculate the transmission services revenue to be obtained from cross-system network use at entry points;

(c) the difference between the overall transmission services revenue to be obtained at entry points and the resulting value referred to in point (b) of this paragraph shall be equal to the transmission services revenue to be obtained from intra-system network use at entry points.

6. Where distance is used as a cost driver in combination with technical or forecasted contracted capacity or flows, the capacity weighted average distance or, respectively, commodity weighted average distance shall be used. Where the results of the capacity, or respectively commodity cost allocation comparison indexes referred to in paragraph 3(c) or, respectively paragraph 4(c), exceed 10 percent, the national regulatory authority shall provide the justification for such results in the decision referred to in Article 27(4).

## **CHAPTER II**

### **REFERENCE PRICE METHODOLOGIES**

#### **Article 6**

#### **Reference price methodology application**

1. The reference price methodology shall be set or approved by the national regulatory authority as set out in Article 27. The reference price methodology to be applied shall be subject to the findings of the periodic consultations carried out in accordance with Article 26 by the transmission system operator(s) or the national regulatory authority, as decided by the national regulatory authority.

2. The application of the reference price methodology shall provide a reference price.

3. The same reference price methodology shall be applied to all entry and exit points in a given entry-exit system subject to the exceptions set out in Articles 10 and 11.

4. Adjustments to the application of the reference price methodology to all entry and exit points may only be made in accordance with Article 9 or as a result of one or more of the following:

(a) benchmarking by the national regulatory authority, whereby reference prices at a given entry or exit point are adjusted so that the resulting values meet the competitive level of reference prices;

(b) equalisation by the transmission system operator(s) or the national regulatory authority, as decided by the national regulatory authority, whereby the same reference price is applied to some or all points within a homogeneous group of points;

(c) rescaling by the transmission system operator(s) or the national regulatory authority, as decided by the national regulatory authority, whereby the reference prices at all entry or all exit points, or both, are adjusted either by multiplying their values by a constant or by adding to or subtracting from their values a constant.

### **Article 7**

#### **Choice of a reference price methodology**

The reference price methodology shall comply with Article 13 of Regulation (EC) No 715/2009 and with the following requirements. It shall aim at:

- (a) enabling network users to reproduce the calculation of reference prices and their accurate forecast;
- (b) taking into account the actual costs incurred for the provision of transmission services considering the level of complexity of the transmission network;
- (c) ensuring non-discrimination and prevent undue cross-subsidisation including by taking into account the cost allocation assessments set out in Article 5;
- (d) ensuring that significant volume risk related particularly to transports across an entry-exit system is not assigned to final customers within that entry-exit system;
- (e) ensuring that the resulting reference prices do not distort cross-border trade.

### **Article 8**

#### **Capacity weighted distance reference price methodology**

1. The parameters for the capacity weighted distance reference price methodology shall be as follows:

- (a) the part of the transmission services revenue to be recovered from capacity-based transmission tariffs;
- (b) the forecasted contracted capacity at each entry point or a cluster of entry points and at each exit point or a cluster of exit points;
- (c) where entry points and exit points can be combined in a relevant flow scenario, the shortest distance of the pipeline routes between an entry point or a cluster of entry points and an exit point or a cluster of exit points;
- (d) the combinations of entry points and exit points, where some entry points and some exit points can be combined in a relevant flow scenario;
- (e) the entry-exit split referred to in Article 30(1)(b)(v)(2) shall be 50/50.

Where entry points and exit points cannot be combined in a flow scenario, this combination of entry and exit points shall not be taken into account.

2. The reference prices shall be derived in the following sequential steps:

- (a) the weighted average distance for each entry point or each cluster of entry points and for each exit point or each cluster of exit points shall be calculated, taking into account, where relevant, the combinations referred to in paragraph 1(d), in accordance with the following respective formulas:
  - (i) for an entry point or cluster of entry points, as the sum of the products of capacity at each exit point or cluster of exit points and the distance from this entry point or cluster of entry points to each exit point or cluster of exit points, divided by the sum of capacities at each exit point or cluster of exit points:

$$AD_{En} = \frac{\sum_{\text{all Ex}} CAP_{Ex} \times D_{En,Ex}}{\sum_{\text{all Ex}} CAP_{Ex}}$$

Where:

$AD_{En}$  is the weighted average distance for an entry point or a cluster of entry points;

$CAP_{Ex}$  is the forecasted contracted capacity at an exit point or a cluster of exit points;

$D_{En,Ex}$  is the distance between a given entry point or a cluster of entry points and a given exit point or a cluster of exit points referred to in paragraph 1(c).

(ii) for an exit point or cluster of exit points, as the sum of the products of capacity at each entry point or cluster of entry points and the distance to this exit point or cluster of exit points from each entry point or cluster of entry points, divided by the sum of capacities at each entry point or cluster of entry points:

$$AD_{Ex} = \frac{\sum_{\text{all En}} CAP_{En} \times D_{En,Ex}}{\sum_{\text{all En}} CAP_{En}}$$

Where:

$AD_{Ex}$  is the weighted average distance for an exit point or a cluster of exit points;

$CAP_{En}$  is the forecasted contracted capacity at an entry point or a cluster of entry points;

$D_{En,Ex}$  is the distance between a given entry point or a cluster of entry points and a given exit point or a cluster of exit points referred to in paragraph 1(c).

(b) the weight of cost for each entry point or each cluster of entry points and for each exit point or each cluster of exit points shall be calculated in accordance with the following respective formulas:

$$W_{c,En} = \frac{CAP_{En} \times AD_{En}}{\sum_{\text{all En}} CAP_{En} \times AD_{En}}$$

$$W_{c,Ex} = \frac{CAP_{Ex} \times AD_{Ex}}{\sum_{\text{all Ex}} CAP_{Ex} \times AD_{Ex}}$$

Where:

$W_{c,En}$  is the weight of cost for a given entry point or a cluster of entry points;

$W_{c,Ex}$  is the weight of cost for a given exit point or a cluster of exit points;

$AD_{En}$  is the weighted average distance for an entry point or a cluster of entry points;

$AD_{Ex}$  is the weighted average distance for an exit point or a cluster of exit points;

$CAP_{En}$  is the forecasted contracted capacity at an entry point or a cluster of entry points;

$CAP_{Ex}$  is the forecasted contracted capacity at an exit point or a cluster of exit points.

(c) the part of the transmission services revenue to be recovered from capacity-based transmission tariffs at all entry points and the part of the transmission services revenue to be recovered from capacity-based transmission tariffs at all exit points shall be identified by applying the entry-exit split;

(d) the part of the transmission services revenue to be recovered from capacity-based transmission tariffs

at each entry point or each cluster of entry points and for each exit point or each cluster of exit points shall be calculated in accordance with the following respective formulas:

$$R_{En} = W_{c,En} \times R_{\Sigma En}$$

$$R_{Ex} = W_{c,Ex} \times R_{\Sigma Ex}$$

Where:

$W_{c,En}$  is the weight of cost for a given entry point or a cluster of entry points;

$W_{c,Ex}$  is the weight of cost for a given exit point or a cluster of exit points;

$R_{En}$  is the part of the transmission services revenue to be recovered from capacity-based transmission tariffs at an entry point or a cluster of entry points;

$R_{Ex}$  is the part of the transmission services revenue to be recovered from capacity-based transmission tariffs at an exit point or a cluster of exit points;

$R_{\Sigma En}$  is the part of the transmission services revenue to be recovered from capacity-based transmission tariffs at all entry points;

$R_{\Sigma Ex}$  is the part of the transmission services revenue to be recovered from capacity-based transmission tariffs at all exit points.”

(e) the resulting values referred to in point (d) shall be divided by the forecasted contracted capacity at each entry point or each cluster of entry points and at each exit point or each cluster of exit points in accordance with the following respective formulas:

$$T_{En} = \frac{R_{En}}{CAP_{En}}$$

$$T_{Ex} = \frac{R_{Ex}}{CAP_{Ex}}$$

Where:

$T_{En}$  is the reference price at an entry point or each entry point within a cluster of entry points;

$T_{Ex}$  is the reference price at an exit point or each exit point within a cluster of exit points;

$CAP_{En}$  is the forecasted contracted capacity at an entry point or a cluster of entry points;

$CAP_{Ex}$  is the forecasted contracted capacity at an exit point or a cluster of exit points.

## Article 9

### Adjustments of tariffs at entry points from and exit points to storage facilities and at entry points from LNG facilities and infrastructure ending isolation

1. A discount of at least 50% shall be applied to capacity-based transmission tariffs at entry points from and exit points to storage facilities, unless and to the extent a storage facility which is connected to more than one transmission or distribution network is used to compete with an interconnection point.
2. At entry points from LNG facilities, and at entry points from and exit points to infrastructure developed

with the purpose of ending the isolation of **Contracting Parties** in respect of their gas transmission systems, a discount may be applied to the respective capacity-based transmission tariffs for the purposes of increasing security of supply.

### **Article 10**

#### **Rules for entry-exit systems within a Contracting Party where more than one transmission system operator is active**

1. In accordance with Article 6(3), the same reference price methodology shall be applied jointly by all transmission system operators within an entry-exit system within a **Contracting Party**.

2. As an exception to paragraph 1 and subject to paragraph 3, the national regulatory authority may decide:

(a) that the same reference price methodology is applied separately by each transmission system operator within an entry-exit system;

(b) as an exception to Article 6(3), when planning entry-exit system mergers, on intermediate steps allowing for different reference price methodologies to be applied separately by each transmission system operator within the entry-exit systems concerned. Such a decision shall set out the time period for the application of the intermediate steps. The national regulatory authority or the transmission system operators, as decided by the national regulatory authority, shall carry out an impact assessment and a cost benefit analysis prior to implementing such intermediate steps.

As a result of applying different reference price methodologies separately, the transmission services revenue of the transmission system operators involved shall be adjusted accordingly.

3. In order to allow for the proper application of the same reference price methodology jointly, an effective inter-transmission system operator compensation mechanism shall be established.

The decision referred to in paragraph 2(a) or, respectively, paragraph 2(b) may be taken where the following conditions are complied with:

(a) an effective inter-transmission system operator compensation mechanism is established with the aim to:

(i) prevent detrimental effects on the transmission services revenue of the transmission system operators involved;

(ii) avoid cross-subsidisation between intra-system and cross-system network use;

(b) such separate application ensures that the costs correspond to those of an efficient transmission system operator.

4. The maximum time period set out in the decision referred to in paragraph 2(a) or, respectively, paragraph 2(b) shall be no later than five years as from the date referred to in Article 38(2). Sufficiently in advance of the date set out in that decision, the national regulatory authority may decide to postpone this date.

5. At the same time as the final consultation in accordance with Article 26, the national regulatory authority shall conduct a consultation on the principles of an effective inter-transmission system operator compensation mechanism referred to in paragraph 3 and its consequences on the tariff levels. The inter-transmission system operator compensation mechanism shall be applied in accordance with Article

41(6)(a) of Directive 2009/73/EC and published together with the consultation responses received.

6. The reserve price referred to in Article 22(1) shall be calculated as set out therein. Where paragraph 2 is applied, the following two calculations shall be carried out:

(a) the calculation set out in Article 22(1) shall be carried out by each transmission system operator involved;

(b) the weighted average of the resulting values referred to in point (a) shall be calculated in accordance with the formula set out in Article 22(1)(b), *mutatis mutandis*.

7. The final consultation referred to in Article 26 shall be conducted by all transmission system operators jointly or by the national regulatory authority. Where paragraph 2 is applied, such consultation shall be conducted by each transmission system operator separately or by the national regulatory authority, as decided by the national regulatory authority.

8. The information referred to in Articles 29 and 30 shall be published on an aggregated level for all transmission system operators involved. Where paragraph 2 is applied, the following two actions shall be carried out:

(a) such information shall be published individually for each transmission system operator involved;

(b) the information on the entry-exit split referred to in Article 30(1)(b)(v)(2) for the entry-exit system shall be published by the national regulatory authority.

### **Article 11**

#### **Rules for entry-exit systems covering more than one Contracting Party or covering Contracting Party(-ies) and Member State(s) where more than one transmission system operator is active**

The same reference price methodology may be applied jointly or separately or different reference price methodologies may be applied separately where more than one transmission system operator is active in an entry-exit system covering more than one **Contracting Party or** Member State.

## **CHAPTER III RESERVE PRICES**

### **Article 12**

#### **General provisions**

1. For yearly standard capacity products for firm capacity, the reference prices shall be used as reserve prices. For non-yearly standard capacity products for firm capacity, the reserve prices shall be calculated as set out in this Chapter. For both yearly and non-yearly standard capacity products for interruptible capacity, the reserve prices shall be calculated as set out in this Chapter. The level of multipliers and of seasonal factors, set out in accordance with Article 13, and the level of discounts for the standard capacity products for interruptible capacity, set out in accordance with Article 16, may be different at

interconnection points.

2. Where the tariff period and gas year do not coincide, separate reserve prices may be applied respectively:

- (a) for the time period from 1 October to the end of the prevailing tariff period; and
- (b) for the time period from the beginning of the tariff period following the prevailing tariff period to 30 September.

3. The respective reserve prices published according to Article 29 shall be binding for the subsequent gas year or beyond the subsequent gas year in case of fixed payable price, beginning after the annual yearly capacity auction, unless:

- (a) the discounts for monthly and daily standard capacity products for interruptible capacity are recalculated within the tariff period if the probability of interruption referred to in Article 16 changes by more than twenty percent;
- (b) the reference price is recalculated within the tariff period due to exceptional circumstances under which the non-adjustment of tariff levels would jeopardise the operation of the transmission system operator.

### **Article 13**

#### **Level of multipliers and seasonal factors**

1. The level of multipliers shall fall within the following ranges:

- (a) for quarterly standard capacity products and for monthly standard capacity products, the level of the respective multiplier shall be no less than 1 and no more than 1,5;
- (b) for daily standard capacity products and for within-day standard capacity products, the level of the respective multiplier shall be no less than 1 and no more than 3. In duly justified cases, the level of the respective multipliers may be less than 1, but higher than 0, or higher than 3.

2. Where seasonal factors are applied, the arithmetic mean over the gas year of the product of the multiplier applicable for the respective standard capacity product and the relevant seasonal factors shall be within the same range as for the level of the respective multipliers set out in paragraph 1.

3. By 1 **October 2025**, the maximum level of multipliers for daily standard capacity products and for within-day standard capacity products shall be no more than 1,5, if by 1 **October 2023** the **Energy Community Regulatory Board** issues a recommendation <...> that the maximum level of multipliers should be reduced to this level. This recommendation shall take into account the following aspects related to the use of multipliers and seasonal factors before and as from 31 May **2021**:

- (a) changes in booking behaviour;
- (b) impact on the transmission services revenue and its recovery;
- (c) differences between the level of transmission tariffs applicable for two consecutive tariff periods;
- (d) cross-subsidisation between network users having contracted yearly and non-yearly standard capacity products;
- (e) impact on cross-border flows.

**Article 14****Calculation of reserve prices for non-yearly standard capacity products for firm capacity in absence of seasonal factors**

The reserve prices for non-yearly standard capacity products for firm capacity shall be calculated as follows:

(a) for quarterly standard capacity products, for monthly standard capacity products and for daily standard capacity products, in accordance with the following formula:

$$P_{st} = (M \times T / 365) \times D$$

Where:

$P_{st}$  is the reserve price for the respective standard capacity product;

$M$  is the level of the multiplier corresponding to the respective standard capacity product;

$T$  is the reference price;

$D$  is the duration of the respective standard capacity product expressed in gas days. For leap years, the formula shall be adjusted so that the figure 365 is substituted with the figure 366.

(b) for within-day standard capacity products, in accordance with the following formula:

$$P_{st} = (M \times T / 8760) \times H$$

Where:

$P_{st}$  is the reserve price for the within-day standard capacity product;

$M$  is the level of the corresponding multiplier;

$T$  is the reference price;

$H$  is the duration of the within-day standard capacity product expressed in hours. For leap years, the formula shall be adjusted so that the figure 8760 is substituted with the figure 8784.

**Article 15****Calculation of reserve prices for non-yearly standard capacity products for firm capacity with seasonal factors**

1. Where seasonal factors are applied, the reserve prices for non-yearly standard capacity products for firm capacity shall be calculated in accordance with the relevant formulas set out in Article 14 which shall be then multiplied by the respective seasonal factor calculated as set out in paragraphs 2 to 6.

2. The methodology set out in paragraph 3 shall be based on the forecasted flows, unless the quantity of the gas flow at least for one month is equal to 0. In such case, the methodology shall be based on the forecasted contracted capacity.

3. For monthly standard capacity products for firm capacity, the seasonal factors shall be calculated in the following sequential steps:

(a) for each month within a given gas year the usage of the transmission system shall be calculated on the basis of forecasted flows or forecasted contracted capacity using:

- (i) the data for the individual interconnection point, where the seasonal factors are calculated for each interconnection point;
  - (ii) the average data on the forecasted flows or the forecasted contracted capacity, where the seasonal factors are calculated for some or all of the interconnection points.
- (b) the resulting values referred to in point (a) shall be summed up;
- (c) the usage rate shall be calculated by dividing each of the resulting values referred to in point (a) by the resulting value referred to in point (b);
- (d) each of the resulting values referred to in point (c) shall be multiplied by 12. Where the resulting values are equal to 0, these values shall be adjusted to whichever of the following is the lower: 0,1 or the lowest of the resulting values other than 0;
- (e) the initial level of the respective seasonal factors shall be calculated by raising each of the resulting values referred to in point (d) to the same power which is no less than 0 and no more than 2;
- (f) the arithmetic mean of the products of the resulting values referred to in point (e) and the multiplier for monthly standard capacity products shall be calculated;
- (g) the resulting value referred to in point (f) shall be compared with the range referred to in Article 13(1), as follows:
- (i) if this value falls within this range then the level of seasonal factors shall be equal to with the respective resulting values referred to in point (e);
  - (ii) if this value falls outside of this range then point (h) shall apply.
- (h) the level of seasonal factors shall be calculated as the product of the respective resulting values referred to in point (e) and the correction factor calculated as follows:
- (i) where the resulting value referred to in point (f) is more than 1,5, the correction factor shall be calculated as 1,5 divided by this value;
  - (ii) where the resulting value referred to in point (f) is less than 1, the correction factor shall be calculated as 1 divided by this value.
4. For daily standard capacity products for firm capacity and within-day standard capacity products for firm capacity, the seasonal factors shall be calculated by carrying out the steps set out in paragraph 3(f) to (h), *mutatis mutandis*.
5. For quarterly standard capacity products for firm capacity, the seasonal factors shall be calculated in sequential steps as follows:
- (a) the initial level of the respective seasonal factors shall be calculated as either of the following:
- (i) equal to the arithmetic mean of the respective seasonal factors applicable for the three relevant months;
  - (ii) no less than the lowest and no more than the highest level of the respective seasonal factors applicable for the three relevant months.
- (b) the steps set out in paragraph 3(f) to (h) shall be carried out, using the resulting values referred to in point (a), *mutatis mutandis*.
6. For all non-yearly standard capacity products for firm capacity, the values resulting from the calculation referred to in paragraphs 3 to 5 may be rounded up or down.

## Article 16

### Calculation of reserve prices for standard capacity products for interruptible capacity

1. The reserve prices for standard capacity products for interruptible capacity shall be calculated by multiplying the reserve prices for the respective standard capacity products for firm capacity calculated as set out in Articles 14 or 15, as relevant, by the difference between 100% and the level of an *ex-ante* discount calculated as set out in paragraphs 2 and 3.

2. An *ex-ante* discount shall be calculated in accordance with the following formula:

$$D_{i_{\text{ex-ante}}} = \text{Pro} \times A \times 100 \%$$

Where:

$D_{i_{\text{ex-ante}}}$  is the level of an *ex-ante* discount;

**Pro factor** is the probability of interruption which is set or approved in accordance with Article 41(6) (a) of Directive 2009/73/EC pursuant to Article 28, and which refers to the type of standard capacity product for interruptible capacity;

**A** is the adjustment factor which is set or approved in accordance with Article 41(6)(a) of Directive 2009/73/EC pursuant to Article 28, applied to reflect the estimated economic value of the type of standard capacity product for interruptible capacity, calculated for each, some or all interconnection points, which shall be no less than 1.

3. The Pro factor referred to in paragraph 2 shall be calculated for each, some or all interconnection points per type of standard capacity product for interruptible capacity offered in accordance with the following formula on the basis of forecasted information related to the components of this formula:

$$\text{Pro} = \frac{N \times D_{\text{int}}}{D} \times \frac{\text{CAP}_{\text{av. int}}}{\text{CAP}}$$

Where:

**N** is the expectation of the number of interruptions over D;

$D_{\text{int}}$  is the average duration of the expected interruptions expressed in hours;

**D** is the total duration of the respective type of standard capacity product for interruptible capacity expressed in hours;

$\text{CAP}_{\text{av. int}}$  is the expected average amount of interrupted capacity for each interruption where such amount is related to the respective type of standard capacity product for interruptible capacity;

**CAP** is the total amount of interruptible capacity for the respective type of standard capacity product for interruptible capacity.

4. As an alternative to applying *ex-ante* discounts in accordance with paragraph 1, the national regulatory authority may decide to apply an *ex-post* discount, whereby network users are compensated after the actual interruptions incurred. Such *ex-post* discount may only be used at interconnection points where there was no interruption of capacity due to physical congestion in the preceding gas year.

The *ex-post* compensation paid for each day on which an interruption occurred shall be equal to three times the reserve price for daily standard capacity products for firm capacity.

## CHAPTER IV RECONCILIATION OF REVENUE

### *Article 17*

#### General provisions

1. Where and to the extent that the transmission system operator functions under a non-price cap regime, the following principles shall apply:

(a) the under- or over-recovery of the transmission services revenue shall be minimised having due regard to necessary investments;

(b) the level of transmission tariffs shall ensure that the transmission services revenue is recovered by the transmission system operator in a timely manner;

(c) significant differences between the levels of transmission tariffs applicable for two consecutive tariff periods shall be avoided to the extent possible.

2. Where and to the extent that the transmission system operator functions under a price cap regime or applies a fixed payable price approach set out in Article 24(b), no revenue reconciliation shall occur and all risks related to under- or over-recovery shall be covered exclusively by the risk premium. In such case Articles 18, 19(1) to (4) and 20 shall not apply.

3. Subject to the requirements of periodic consultations pursuant to Article 26 and subject to approval in accordance with Article 41(6)(a) of Directive 2009/73/EC, non-transmission services revenue may be reconciled as set out in this Chapter, *mutatis mutandis*.

### *Article 18*

#### Under- and over-recovery

The under- or over-recovery of the transmission services revenue shall be equal to:

$$R_A - R$$

Where:

$R_A$  is the actually obtained revenue related to the provision of transmission services;

$R$  is the transmission services revenue. The values of  $R_A$  and  $R$  shall be attributed to the same tariff period and, where an effective inter-transmission system operator compensation mechanism referred to in Article 10(3) is established, shall take such mechanism into account.

Where the difference calculated in accordance with paragraph 1 is positive, it shall indicate an over-recovery of the transmission services revenue. Where such difference is negative, it shall indicate an under-recovery of the transmission services revenue.

**Article 19****Regulatory account**

1. The regulatory account shall indicate the information referred to in Article 18(1) for a given tariff period and may include other information, such as the difference between the anticipated and the actual cost components.
2. The transmission system operator's under- or over-recovered transmission services revenue shall be attributed to the regulatory account, unless other rules have been enacted in accordance with Article 41(6)(a) of Directive 2009/73/EC.
3. Where incentive mechanisms for capacity sales are implemented, subject to a decision in accordance with Article 41(6)(a) of Directive 2009/73/EC, only a part of the transmission system operator's under- or over-recovery shall be attributed to the regulatory account. In such case, the residual part thereof shall be kept or paid, as relevant, by the transmission system operator.
4. Each transmission system operator shall use one regulatory account.
5. Subject to a decision in accordance with Article 41(6)(a) of Directive 2009/73/EC, the earned auction premium, if any, may be attributed to a specific account separate from the regulatory account referred to in paragraph 4. The national regulatory authority may decide to use this auction premium for reducing physical congestion or, where the transmission system operator functions only under a non-price cap regime, to decrease the transmission tariffs for the next tariff period(s) as set out in Article 20.

**Article 20****Reconciliation of regulatory account**

1. The full or partial reconciliation of the regulatory account shall be carried out in accordance with the applied reference price methodology and, in addition, by using the charge referred to in Article 4(3)(b), if applied.
2. The reconciliation of the regulatory account shall be carried out pursuant to the rules enacted in accordance with Article 41(6)(a) of Directive 2009/73/EC over a given reconciliation period, meaning the time period over which the regulatory account referred to in Article 19 shall be reconciled.
3. The regulatory account shall be reconciled with the aim of reimbursing to the transmission system operator the under-recovery and of returning to the network users the over-recovery.

## CHAPTER V

### PRICING OF BUNDLED CAPACITY AND CAPACITY AT VIRTUAL INTERCONNECTION POINTS

#### *Article 21*

#### **Pricing of bundled capacity**

1. The reserve price for a bundled capacity product shall be equal to the sum of the reserve prices for the capacities contributing to such product. The reserve prices for corresponding entry and exit capacities shall be made available when the bundled capacity product is offered and allocated by means of a joint booking platform referred to in Article 37 of Regulation (EU) 2017/459.
2. The revenue originating from the bundled capacity product sales corresponding to the reserve price for such product shall be attributed to the respective transmission system operators as follows:
  - (a) after each transaction for a bundled capacity product;
  - (b) in proportion to the reserve prices for the capacities contributing to such product.
3. The auction premium originating from the bundled capacity product sales shall be attributed in accordance with the agreement between the respective transmission system operators which is subject to the approval by the national regulatory authority or authorities to be granted no later than three months before the start of the annual yearly capacity auctions. In absence of such approval by all national regulatory authorities involved, the auction premium shall be attributed to the respective transmission system operators equally.
4. Where the interconnection point concerned connects adjacent entry-exit systems of two **Contracting Parties**, the respective national regulatory authorities shall submit the agreement referred to in paragraph 3 to the **Energy Community Regulatory Board** for information.

#### *Article 22*

#### **Pricing of capacity at a virtual interconnection point**

1. The reserve price for an unbundled standard capacity product offered at a virtual interconnection point shall be calculated in accordance with either of the following approaches:
  - (a) calculated on the basis of the reference price, where the applied reference price methodology allows for taking into account the established virtual interconnection point;
  - (b) equal to the weighted average of the reserve prices, where such average is calculated on the basis of the reference prices for each interconnection point contributing to such virtual interconnection point, where the applied reference price methodology does not allow for taking into account the established virtual interconnection point, in accordance with the following formula:

$$P_{st, VIP} = \frac{\sum_i^n (P_{st, i} \times CAP_i)}{\sum_i^n CAP_i}$$

Where:

$P_{st, VIP}$  is the reserve price for a given unbundled standard capacity product at the virtual interconnection point;

$i$  is an interconnection point contributing to the virtual interconnection point;

$n$  is the number of interconnection points contributing to the virtual interconnection point;

$P_{st, i}$  is the reserve price for a given unbundled standard capacity product at interconnection point  $i$ ;

$CAP_i$  is technical capacity or forecasted contracted capacity, as relevant, at interconnection point  $i$ .

2. The reserve price for a bundled standard capacity product offered at a virtual interconnection point shall be calculated as set out in Article 21(1).

## CHAPTER VI CLEARING PRICE AND PAYABLE PRICE

### Article 23

#### Calculation of clearing price at interconnection points

The clearing price for a given standard capacity product at an interconnection point shall be calculated in accordance with the following formula:

$$P_{cl} = P_{R, au} + AP$$

Where:

$P_{cl}$  is the clearing price;

$P_{R, au}$  is the applicable reserve price for a standard capacity product which is published at the time when this product is auctioned;

$AP$  is the auction premium, if any.

### Article 24

#### Calculation of payable price at interconnection points

The payable price for a given standard capacity product at an interconnection point shall be calculated in accordance with either of the following formulas:

(a) where the floating payable price approach is applied:

$$P_{flo} = P_{R, flo} + AP$$

Where:

$P_{flo}$  is the floating payable price;

$P_{R, flo}$  is the reserve price for a standard capacity product applicable at the time when this product may be used;

$AP$  is the auction premium, if any.

(b) where the fixed payable price approach is applied:

$$P_{\text{fix}} = (P_{R,y} \times \text{IND}) + \text{RP} + \text{AP}$$

Where:

$P_{\text{fix}}$  is the fixed payable price;

$P_{R,y}$  is the applicable reserve price for a yearly standard capacity product which is published at the time when this product is auctioned;

**IND** is the ratio between the chosen index at the time of use and the same index at the time the product was auctioned;

**RP** is the risk premium reflecting the benefits of certainty regarding the level of transmission tariff, where such premium shall be no less than 0;

**AP** is the auction premium, if any.

### Article 25

#### Conditions for offering payable price approaches

1. Where and to the extent that the transmission system operator functions under a non-price cap regime, the conditions for offering payable price approaches shall be as follows:

(a) for cases where only existing capacity is offered:

- (i) the floating payable price approach shall be offered;
- (ii) the fixed payable price approach shall not be allowed.

(b) for incremental capacity and existing capacity offered in the same auction or same alternative allocation mechanism:

- (i) the floating payable price approach may be offered;
- (ii) the fixed payable price approach may be offered where one of the following conditions is met:

(1) an alternative allocation mechanism set out in Article 30 of Regulation (EU) 2017/459 is used;

(2) a project is included in the **list of Projects of Energy Community Interest or Projects of Mutual Interest** as set out in Article 3 of Regulation (EU) No 347/2013 **as adopted and adapted by Ministerial Council Decision 2015/09/MC-Enc.**

2. Where and to the extent that the transmission system operator functions under a price cap regime, the floating payable price approach or the fixed payable price approach, or both, may be offered.

## CHAPTER VII

### CONSULTATION REQUIREMENTS

#### *Article 26*

#### **Periodic consultation**

1. One or more consultations shall be carried out by the national regulatory authority or the transmission system operator(s), as decided by the national regulatory authority. To the extent possible and in order to render more effective the consultation process, the consultation document should be published in the English language. The final consultation prior to the decision referred to in Article 27(4) shall comply with the requirements set out in this Article and Article 27, and shall include the following information:

(a) the description of the proposed reference price methodology as well as the following items:

(i) the indicative information set out in Article 30(1)(a), including:

(1) the justification of the parameters used that are related to the technical characteristics of the system;

(2) the corresponding information on the respective values of such parameters and the assumptions applied.

(ii) the value of the proposed adjustments for capacity-based transmission tariffs pursuant to Article 9;

(iii) the indicative reference prices subject to consultation;

(iv) the results, the components and the details of these components for the cost allocation assessments set out in Article 5;

(v) the assessment of the proposed reference price methodology in accordance with Article 7;

(vi) where the proposed reference price methodology is other than the capacity weighted distance reference price methodology detailed in Article 8, its comparison against the latter accompanied by the information set out in point (iii);

(b) the indicative information set out in Article 30(1)(b)(i), (iv), (v);

(c) the following information on transmission and non-transmission tariffs:

(i) where commodity-based transmission tariffs referred to in Article 4(3) are proposed:

(1) the manner in which they are set;

(2) the share of the allowed or target revenue forecasted to be recovered from such tariffs;

(3) the indicative commodity-based transmission tariffs;

(ii) where non-transmission services provided to network users are proposed:

(1) the non-transmission service tariff methodology therefor;

(2) the share of the allowed or target revenue forecasted to be recovered from such tariffs;

(3) the manner in which the associated non-transmission services revenue is reconciled as referred to in Article 17(3);

- (4) the indicative non-transmission tariffs for non-transmission services provided to network users;
- (d) the indicative information set out in Article 30(2);
- (e) where the fixed payable price approach referred to in Article 24(b) is considered to be offered under a price cap regime for existing capacity:
- (i) the proposed index;
  - (ii) the proposed calculation and how the revenue derived from the risk premium is used;
  - (iii) at which interconnection point(s) and for which tariff period(s) such approach is proposed;
  - (iv) the process of offering capacity at an interconnection point where both fixed and floating payable price approaches referred to in Article 24 are proposed.
2. The final consultation prior to the decision referred to in Article 27(4) shall be open for at least two months. Consultation documents for any of the consultations referred to in paragraph 1 may require that replies submitted in response to the consultation shall include a non-confidential version suitable for publication.
3. Within one month following the end of the consultation, the transmission system operator(s) or the national regulatory authority, depending on the entity that publishes the consultation document referred to in paragraph 1, shall publish the consultation responses received and their summary. To the extent possible and in order to render more effective the consultation process, the summary should be provided in the English language.
4. The subsequent periodic consultations shall be conducted in accordance with Article 27(5).
5. <...> **For the consultation document referred to in paragraph 1, the template developed by Agency for Cooperation of European Regulators may be used. <...>**

### **Article 27**

#### **Periodic national regulatory authority decision-making**

1. Upon launching the final consultation pursuant to Article 26 prior to the decision referred to in Article 27(4), the national regulatory authority or the transmission system operator(s), as decided by the national regulatory authority, shall forward the consultation documents to the **Energy Community Regulatory Board**.
2. The **Energy Community Regulatory Board** shall analyse the following aspects of the consultation document:
- (a) whether all the information referred to in Article 26(1) has been published;
  - (b) whether the elements consulted on in accordance with Article 26 comply with the following requirements:
    - (i) whether the proposed reference price methodology complies with the requirements set out in Article 7;
    - (ii) whether the criteria for setting commodity-based transmission tariffs as set out in Article 4(3) are met;

(iii) whether the criteria for setting non-transmission tariffs as set out in Article 4(4) are met. 3. Within two months following the end of the consultation referred to in paragraph 1, the **Energy Community Regulatory Board** shall publish and send to the national regulatory authority or transmission system operator, depending on which entity published the consultation document, and the **Energy Community Secretariat** the conclusion of its analysis in accordance with paragraph 2 in English.

The **Energy Community Regulatory Board** shall preserve the confidentiality of any commercially sensitive information.

4. Within five months following the end of the final consultation, the national regulatory authority, acting in accordance with Article 41(6)(a) of Directive 2009/73/EC, shall take and publish a motivated decision on all items set out in Article 26(1). Upon publication, the national regulatory authority shall send to the **Energy Community Regulatory Board** and the **Energy Community Secretariat** its decision.

5. The procedure consisting of the final consultation on the reference price methodology in accordance with Article 26, the decision by the national regulatory authority in accordance with paragraph 4, the calculation of tariffs on the basis of this decision, and the publication of the tariffs in accordance with Chapter VIII may be initiated as from the entry into force of this Regulation and shall be concluded no later than 31 May 2021. The requirements set out in Chapters II, III and IV shall be taken into account in this procedure. The tariffs applicable for the prevailing tariff period at 31 May 2021 will be applicable until the end thereof. This procedure shall be repeated at least every five years starting from 31 May 2021.

## *Article 28*

### **Consultation on discounts, multipliers and seasonal factors**

1. At the same time as the final consultation carried out in accordance with Article 26(1), the national regulatory authority shall conduct a consultation with the national regulatory authorities of all directly connected Member States **and Contracting Parties** and the relevant stakeholders on the following:

- (a) the level of multipliers;
- (b) if applicable, the level of seasonal factors and the calculations set out in Article 15;
- (c) the levels of discounts set out in Articles 9(2) and 16.

After the end of the consultation a motivated decision shall be taken in accordance with Article 41(6)(a) of Directive 2009/73/EC on the aspects referred to in points (a) to (c) of this paragraph. Each national regulatory authority shall consider the positions of national regulatory authorities of directly connected Member States **and Contracting Parties**.

2. The subsequent consultations shall be conducted every tariff period as from the date of the decision referred to in paragraph 1. After each consultation and as set out in Article 32(a), the national regulatory authority shall take and publish a motivated decision on the aspects referred to in paragraph 1(a), (b) and (c).

3. When adopting the decision referred to in paragraphs 1 and 2, the national regulatory authority shall take into account the consultation responses received and the following aspects:

- (a) for multipliers:
  - (i) the balance between facilitating short-term gas trade and providing long-term signals for efficient

- investment in the transmission system;
- (ii) the impact on the transmission services revenue and its recovery;
- (iii) the need to avoid cross-subsidisation between network users and to enhance cost-reflectivity of reserve prices;
- (iv) situations of physical and contractual congestion;
- (v) the impact on cross-border flows;
- (b) for seasonal factors:
  - (i) the impact on facilitating the economic and efficient utilisation of the infrastructure;
  - (ii) the need to improve the cost-reflectivity of reserve prices.

## CHAPTER VIII PUBLICATION REQUIREMENTS

### *Article 29*

#### **Information to be published before the annual yearly capacity auction**

For interconnection points and, where the national regulatory authority takes a decision to apply Regulation (EU) 2017/459, points other than interconnection points, the following information shall be published before the annual yearly capacity auction in accordance with the requirements set out in Articles 31 and 32 by the national regulatory authority or the transmission system operator(s), as decided by the national regulatory authority:

- (a) for standard capacity products for firm capacity:
  - (i) the reserve prices applicable until at least the end of the gas year beginning after the annual yearly capacity auction;
  - (ii) the multipliers and seasonal factors applied to reserve prices for non-yearly standard capacity products;
  - (iii) the justification of the national regulatory authority for the level of multipliers;
  - (iv) where seasonal factors are applied, the justification for their application.
- (b) for standard capacity products for interruptible capacity:
  - (i) the reserve prices applicable until at least the end of the gas year beginning after the annual yearly capacity auction;
  - (ii) an assessment of the probability of interruption including:
    - (1) the list of all types of standard capacity products for interruptible capacity offered including the respective probability of interruption and the level of discount applied;
    - (2) the explanation of how the probability of interruption is calculated for each type of product referred to in point (1);
    - (3) the historical or forecasted data, or both, used for the estimation of the probability of interruption referred to in point (2).

**Article 30****Information to be published before the tariff period**

1. The following information shall be published before the tariff period in accordance with the requirements set out in Articles 31 and 32 by the national regulatory authority or the transmission system operator(s), as decided by the national regulatory authority:

(a) information on parameters used in the applied reference price methodology that are related to the technical characteristics of the transmission system, such as:

- (i) technical capacity at entry and exit points and associated assumptions;
- (ii) forecasted contracted capacity at entry and exit points and associated assumptions;
- (iii) the quantity and the direction of the gas flow for entry and exit points and associated assumptions, such as demand and supply scenarios for the gas flow under peak conditions;
- (iv) the structural representation of the transmission network with an appropriate level of detail;
- (v) additional technical information about the transmission network, such as the length and the diameter of pipelines and the power of compressor stations.

(b) the following information:

- (i) the allowed or target revenue, or both, of the transmission system operator;
- (ii) the information related to changes in the revenue referred to in point (i) from one year to the next year;
- (iii) the following parameters:
  - (1) types of assets included in the regulated asset base and their aggregated value;
  - (2) cost of capital and its calculation methodology;
  - (3) capital expenditures, including:
    - (a) methodologies to determine the initial value of the assets;
    - (b) methodologies to re-evaluate the assets;
    - (c) explanations of the evolution of the value of the assets;
    - (d) depreciation periods and amounts per asset type.
  - (4) operational expenditures;
  - (5) incentive mechanisms and efficiency targets;
  - (6) inflation indices.
- (iv) the transmission services revenue;
- (v) the following ratios for the revenue referred to in point (iv):
  - (1) capacity-commodity split, meaning the breakdown between the revenue from capacity-based transmission tariffs and the revenue from commodity-based transmission tariffs;
  - (2) entry-exit split, meaning the breakdown between the revenue from capacity-based transmission tariffs at all entry points and the revenue from capacity-based transmission tariffs at all exit points;

(3) intra-system/cross-system split, meaning the breakdown between the revenue from intra-system network use at both entry points and exit points and the revenue from cross-system network use at both entry points and exit points calculated as set out in Article 5.

(vi) where and to the extent that the transmission system operator functions under a non-price cap regime, the following information related to the previous tariff period on regarding the reconciliation of the regulatory account:

(1) the actually obtained revenue, the under- or over-recovery of the allowed revenue and the part thereof attributed to the regulatory account and, if applicable, sub-accounts within such regulatory account;

(2) the reconciliation period and the incentive mechanisms implemented.

(vii) the intended use of the auction premium.

(c) the following information on transmission and non-transmission tariffs, accompanied by the relevant information related to their derivation:

(i) where applied, commodity-based transmission tariffs referred to in Article 4(3);

(ii) where applied, non-transmission tariffs for non-transmission services referred to in Article 4(4);

(iii) the reference prices and other prices applicable at points other than those referred to in Article 29.

2. In addition, the following information shall be published with regard to transmission tariffs:

(a) explanation of the following:

(i) the difference in the level of transmission tariffs for the same type of transmission service applicable for the prevailing tariff period and for the tariff period for which the information is published;

(ii) the estimated difference in the level of transmission tariffs for the same type of transmission service applicable for the tariff period for which the information is published and for each tariff period within the remainder of the regulatory period.

(b) at least a simplified tariff model, updated regularly, accompanied by the explanation of how to use it, enabling network users to calculate the transmission tariffs applicable for the prevailing tariff period and to estimate their possible evolution beyond such tariff period.

3. For the points excluded from the definition of relevant points referred to in point 3.2(1)(a) of Annex I to Regulation (EC) No 715/2009, the information on the amount of forecasted contracted capacity and the forecasted quantity of the gas flow shall be published as set out in point 3.2(2) of Annex I to Regulation (EC) No 715/2009.

### **Article 31**

#### **Form of publication**

1. **For the Contracting Parties whose TSOs are members or observers of ENTSO for Gas** the information referred to in Articles 29 and 30 shall be published as set out in Article 32 via a link on the platform referred to in point 3.1.1(1)(h) of Annex I to Regulation (EC) No 715/2009 to the website of the respective entity.

Such information shall be accessible to the public, free of charge and of any limitations as to its use. It shall be published:

- (a) in a user-friendly manner;
- (b) in a clear, easily accessible way and on a non-discriminatory basis;
- (c) in a downloadable format;
- (d) in one or more of the official languages of the **Contracting Party** and, <...> to the extent possible, in English.

**2. For the Contracting Parties whose TSOs are members or observers of ENTSO for Gas** the following information shall be published for interconnection points on the platform referred to in point 3.1.1(1)(h) of Annex I to Regulation (EC) No 715/2009:

- (a) at the same time as set out in Article 29, the reserve prices for standard capacity products for firm capacity and for standard capacity products for interruptible capacity;
- (b) at the same time as set out in Article 30, a flow-based charge referred to in Article 4(3)(a), where applied.

**For other Contracting Parties such information shall be published on the website of the national transmission system operator(s) for gas.**

3. The information referred to in paragraph 2 shall be published in the following manner:

- (a) as set out in paragraph 1(a) to (c);
- (b) in English;
- (c) in a standardised table which shall include at least the following information:
  - (i) the interconnection point;
  - (ii) the direction of the gas flow;
  - (iii) the names of the relevant transmission system operators;
  - (iv) the start and the end time of the product;
  - (v) whether the capacity is firm or interruptible;
  - (vi) the indication of the standard capacity product;
  - (vii) the applicable tariff per kWh/h and per kWh/d in the local currency and in the euro taking into account the following:
    - (1) where the applied capacity unit is kWh/h, the information on the applicable tariff per kWh/d shall be non-binding, and vice versa;
    - (2) where the local currency is other than the euro, the information on the applicable tariff in euro shall be non-binding.

In addition, at the same time as set out in Article 30, such standardised table shall include the simulation of all the costs for flowing 1 GWh/day/year for each interconnection point in the local currency and in the euro subject to point vii(2).

4. Where the information referred to in paragraph 2 is different from the respective information referred to in paragraph 1, the respective information referred to in paragraph 1 shall prevail.

**Article 32****Publication notice period**

The deadline for the publication of the information set out in Articles 29 and 30 shall be as follows:

- (a) for the information set out in Article 29, no later than thirty days before the annual yearly capacity auction;
- (b) for the information set out in Article 30, no later than thirty days before the respective tariff period;
- (c) for the respective transmission tariffs updated within the tariff period as set out in Article 12(3), immediately after the approval in accordance with Article 41(6)(a) of Directive 2009/73/EC.

Each update of the transmission tariffs shall be accompanied by information indicating the reasons for the changes in their level. Where Article 12(3)(b) is applied, it shall also be accompanied by the updated report referred to in Article 29(b) for the respective types of standard capacity products for interruptible capacity.

## **CHAPTER IX INCREMENTAL CAPACITY**

**Article 33****Tariff principles for incremental capacity**

1. The minimum price at which transmission system operators shall accept a request for incremental capacity is the reference price. For the calculation of the economic test, reference prices shall be derived by including into the reference price methodology the relevant assumptions related to the offer of incremental capacity.
2. Where the fixed payable price approach set out in Article 24(b) is considered to be offered for incremental capacity, the reserve price referred to in Article 24(b) shall be based on projected investment and operating costs. Once the incremental capacity is commissioned, such reserve price shall be adjusted proportionally to the difference, irrespective whether positive or negative, between the projected investment costs and the actual investment costs.
3. In case the allocation of all incremental capacity at the reference price would not generate sufficient revenues for a positive economic test outcome, a mandatory minimum premium may be applied in the first auction or alternative allocation mechanism in which the incremental capacity is offered. The mandatory minimum premium may also be applied in subsequent auctions when the capacity is offered that initially remained unsold or when capacity is offered that was initially set aside according to Article 8(8) and (9) of Regulation (EU) 2017/459. The decision on whether and in which auctions to apply a mandatory minimum premium shall be taken in accordance with Article 41(6)(a) of Directive 2009/73/EC.
4. The level of the mandatory minimum premium shall enable a positive economic test outcome with the revenues generated by the offered capacity in the first auction or alternative allocation mechanism in which the incremental capacity is on offer. The range of the level for the mandatory minimum premium, depending on the expected allocated capacity, shall be submitted to the relevant national regulatory

authorities for approval in accordance with Article 25(1)(c) of Regulation (EU) 2017/459.

5. A mandatory minimum premium approved by the national regulatory authority shall be added to the reference price for the bundled capacity products at the respective interconnection point and shall exclusively be attributed to the transmission system operators for which the mandatory minimum premium was approved by the respective national regulatory authority. This default principle for the attribution of a mandatory minimum premium is without prejudice to the split of a possible additional auction premium according to Article 21(3) or an alternative agreement between the involved national regulatory authorities.

## CHAPTER X FINAL AND TRANSITIONAL PROVISIONS

### *Article 34*

#### **Methodologies and parameters used to determine the allowed or target revenue of transmission system operators**

1. Before **1 October 2021**, the **Energy Community Regulatory Board** shall publish a report on the methodologies and parameters used to determine the allowed or target revenue of transmission system operators. The report shall be based on at least the parameters referred to in Article 30(1)(b)(iii).
2. National regulatory authorities shall submit to the **Energy Community Regulatory Board**, in accordance with the process defined by the **Energy Community Regulatory Board**, all necessary information related to the methodologies and parameters used to determine the allowed or target revenue of transmission system operators.

### *Article 35*

#### **Existing contracts**

1. This Regulation shall not affect the levels of transmission tariffs resulting from contracts or capacity bookings concluded before **1 October 2019** where such contracts or capacity bookings foresee no change in the levels of the capacity- and/or commodity-based transmission tariffs except for indexation, if any.
2. The contract provisions related to transmission tariffs and capacity bookings referred to in paragraph 1 shall not be renewed, prolonged or rolled over after their expiration date.
3. Before **1 November 2019**, a transmission system operator shall send the contracts or the information on capacity bookings, if any, referred to in paragraph 1 to the national regulatory authority for information.

**Article 36****Implementation monitoring**

1. <...> **In context of its implementation monitoring responsibilities, the Energy Community Secretariat** shall monitor and analyse <...> how transmission system operators have implemented this Regulation. <...>
2. Transmission system operators shall submit to **the Energy Community Secretariat** all information required by **the Energy Community Secretariat** to comply with its obligations pursuant to paragraph 1, in accordance with the following deadlines:
  - (a) **1 July 2020** as regards the requirements under Chapter VIII;
  - (b) 31 December **2021** as regards all other provisions of this Regulation.
3. <...>
4. The confidentiality of commercially sensitive information shall be preserved by **the Energy Community Secretariat**.
5. Within three years as from the **deadline for transposition** of this Regulation **in the Energy Community**, the **Energy Community Regulatory Board** shall publish a report on the application of reference price methodologies in **Contracting Parties**.

**Article 37****Power to grant derogations**

1. National regulatory authorities may, at the request of an entity which operates an interconnector that has benefited from an exemption from Article 41(6), (8) and (10) of Directive 2009/73/EC in accordance with Article 36 of that Directive or a similar exemption, jointly grant such entity a derogation from the application of one or more Articles of this Regulation in accordance with paragraphs 2 to 6 of this Article where the application of those Articles to such entity would have one or several of the following negative consequences. It would:
  - (a) not facilitate efficient gas trade and competition;
  - (b) not provide incentives for investment for new capacity or to maintain existing levels of capacity;
  - (c) unreasonably distort cross-border trade;
  - (d) distort competition with other infrastructure operators that offer services of a similar nature to those of the interconnector;
  - (e) not be implementable when taking into account the specific nature of interconnectors.
2. The entity requesting a derogation under paragraph 1 shall include in its request a detailed reasoning, with all supporting documents, including, where appropriate, a cost-benefit analysis, demonstrating that one or more of the conditions in paragraph 1(a) to (e) are complied with.
3. The national regulatory authorities concerned shall jointly assess the request for a derogation and deal with it in close cooperation. Where the relevant national regulatory authorities grant a derogation, they shall specify its duration in their decisions.

4. The national regulatory authorities shall notify their decisions granting such derogations to the **Energy Community Regulatory Board** and the **Energy Community Secretariat**.

5. The national regulatory authorities may revoke a derogation if the circumstances or underlying reasons, or both, no longer apply or upon a reasoned recommendation of the **Energy Community Regulatory Board** or the **Energy Community Secretariat** to revoke a derogation due to a lack of justification.

**Article 38**

<...>

## REGULATION (EU) 312/2014 of 26 March 2014 establishing a network code on gas balancing of transmission networks

Incorporated and adapted by Permanent High Level Group Decision 2019/01/PHLG-EnC of 12 December 2019.

*The adaptations made by Permanent High Level Group Decision 2019/01/PHLG-EnC are highlighted in **bold and blue***

Whereas:

(1) The urgent completion of a fully functioning and interconnected internal energy market which contributes to ensuring the supply of affordable and sustainable energy to the Union's economy is crucial to the objective of increasing competitiveness and ensuring that all consumers can purchase energy at the keenest prices.

(2) In order to move towards greater market integration, it is important that rules on gas balancing of transmission networks facilitate gas trading across balancing zones thus contributing towards the development of market liquidity. This Regulation therefore sets out harmonized Union-wide rules on balancing which have the objective to give network users the certainty that they can manage their balance positions in different balancing zones throughout the Union in an economically efficient and non-discriminative manner.

(3) This Regulation supports the development of a competitive short term wholesale gas market in the European Union that enables the provision of gas flexibility, from whatever source, to offer it for purchase and sale via market mechanisms so that network users can balance their balancing portfolios efficiently or the transmission system operator can use the gas flexibility when balancing the transmission network.

(4) Regulation (EC) No 715/2009 sets non-discriminatory rules for access conditions to the natural gas transmission networks with a view to ensuring the proper functioning of the internal market in gas. Market-based balancing rules financially incentivise network users to balance their balancing portfolios via cost-reflective imbalance charges.

(5) Network users are to bear the responsibility of balancing their inputs against their off-takes, with the balancing rules designed to promote a short- term wholesale gas market, with trading platforms established to better facilitate gas trade between network users and the transmission system operator. The transmission system operators carry out any residual balancing of the transmission networks that might be necessary. In doing so, the transmission system operators should follow the merit order. The merit order is constructed so that transmission system operators will procure gas taking account of both economical and operational considerations, using products that can be delivered from the widest range of sources, including products sourced from LNG and storage facilities. The transmission system operators should aim to maximise the amount of their gas balancing needs through the purchase and sale of short- term standardised products on the short term wholesale gas market.

(6) In order to enable network users to balance their balancing portfolios, this Regulation also sets out minimum requirements for information provision to implement a market-based balancing regime. The information flows provided under this Regulation therefore aim to support the daily balancing

regime and seek to be a set of information to support the network user in managing its risks and opportunities in a cost efficient way.

(7) In addition to the protection of commercially sensitive information, under this Regulation the transmission system operators should preserve the confidentiality of information and data submitted to them for the purpose of implementation of this Regulation and should not disclose to third parties any of this information and data or part of it except and to the extent legally entitled to.

(8) This Regulation has been adopted on the basis of Regulation (EC) No 715/2009 which it supplements and of which it forms an integral part. References to Regulation (EC) No 715/2009 in other legal acts shall be understood as also referring to this Regulation. This Regulation does apply to non-exempted capacities in major new infrastructures which have received an exemption from Article 32 of Directive 2009/73/EC of the European Parliament and of the Council or from the former Article 18 of Directive 2003/55/EC of the European Parliament and of the Council to the extent the application of this Regulation does not undermine such an exemption. This Regulation shall be applied taking into account the specific nature of interconnectors.

(9) This Regulation was established according to the procedure as set out in Article 6 of Regulation (EC) No 715/2009. It further harmonises the balancing rules laid down in Article 21 Regulation (EC) No 715/2009 in order to facilitate gas trade.

(10) This Regulation includes provisions that apply to distribution system operators and that aim to harmonise their roles only where and to the extent necessary for the due implementation of these provisions.

(11) National regulatory authorities and transmission system operators should have regard to best practices and endeavours to harmonise processes for the implementation of this Regulation. Acting in accordance with Article 7 of Regulation (EC) No 713/2009 of the European Parliament and of the Council of 13 July 2009 establishing an Agency for the Cooperation of Energy Regulators, the Agency and the national regulatory authorities should ensure that balancing rules are implemented across the Union in the most effective way.

(12) The measures provided for in this Regulation are in accordance with the opinion of the Committee established pursuant to Article 51 of Directive 2009/73/EC.

## **CHAPTER I GENERAL PROVISIONS**

### ***Article 1***

#### **Subject matter**

This Regulation establishes a Network Code setting out gas balancing rules, including network-related rules on nomination procedures, imbalance charges, settlement processes associated with the daily imbalance charge and operational balancing between transmission system operators' networks.

## **Article 2**

### **Scope**

1. This Regulation shall apply to balancing zones within the borders of the **Energy Community Contracting Parties**.

2. <...>

3. This Regulation shall not apply to reconciliation that would be necessary between the allocations and actual consumption subsequently derived from final customer meter readings when obtained.

4. This Regulation shall not apply in emergency situations where the transmission system operator shall implement specific measures defined under the applicable national rules and on the basis of **the applicable Energy Community security of supply rules**, as appropriate.

5. The respective rights and obligations originating from this Regulation with regard to network users shall only apply to those network users which have concluded a legally binding agreement, being a transport contract or another contract, which enables them to submit trade notifications in accordance with Article 5.

## **Article 3**

### **Definitions**

For the purposes of this Regulation, the definitions in Article 2 of Regulation (EC) No 715/2009, Article 3 Commission Regulation (EU) No **459/2017** establishing a Network Code on Capacity Allocation Mechanisms in Gas Transmission Systems and **repealing Regulation (EU) 984/2013** as well as Article 2 of Directive 2009/73/EC shall apply. In addition, the following definitions shall apply:

(1) 'balancing zone' means an entry-exit system to which a specific balancing regime is applicable and which may include distribution systems or part of them;

(2) 'balancing action' means an action undertaken by the transmission system operator to change the gas flows onto or off the transmission network, excluding those actions related to gas unaccounted for as off-taken from the system and gas used by the transmission system operator for the operation of the system;

(3) 'neutrality charge for balancing' means a charge amounting to the difference between the amounts received or receivable and the amounts paid or payable by the transmission system operator due to performance of its balancing activities which is payable to or recoverable from the relevant network users;

(4) 'trading platform' means an electronic platform provided and operated by a trading platform operator by means of which trading participants may post and accept, including the right to revise and withdraw, bids and offers for gas required to meet short term fluctuations in gas demand or supply, in accordance with the terms and conditions applicable on the trading platform and at which the transmission system operator trades for the purpose of undertaking balancing actions;

(5) 'trading participant' means a network user or a transmission system operator holding a contract with the trading platform operator and satisfying the conditions necessary to transact on the trading

platform.

(6) 'balancing platform' means a trading platform where a transmission system operator is a trading participant to all trades;

(7) 'balancing service' means a service provided to a transmission system operator via a contract for gas required to meet short term fluctuations in gas demand or supply, which is not a short term standardised product;

(8) 'confirmed quantity' means the quantity of gas confirmed by a transmission system operator to be scheduled or re-scheduled to flow on gas day D;

(9) 'daily imbalance charge' means the amount of money a network user pays or receives in respect of a daily imbalance quantity;

(10) 'daily metered' means that the gas quantity is measured and collected once per gas day;

(11) 'intraday metered' means that the gas quantity is measured and collected a minimum of two times within the gas day;

(12) 'non daily metered' means that the gas quantity is measured and collected less frequently than once per gas day;

(13) 'balancing portfolio' means a grouping of a network user's inputs and off-takes;

(14) 'notification quantity' means the quantity of gas transferred between a transmission system operator and a network user or network users or balancing portfolios, as appropriate;

(15) 'allocation' means the quantity of gas attributed to a network user by a transmission system operator as an input or an off-take expressed in kWh for the purpose of determining the daily imbalance quantity;

(16) 're-nomination cycle' means the process carried out by the transmission system operator in order to provide a network user with the message regarding the confirmed quantities following the receipt of a re-nomination;

(17) 'within day charge' means a charge levied or a payment made by a transmission system operator on or to a network user as a result of a within day obligation;

(18) 'within day obligation' means a set of rules regarding network users' inputs and off-takes within the gas day imposed by a transmission system operator on network users;

(19) 'base case' means the model for information provision where the information on non- daily metered off-takes consists of a day ahead and within day forecasts;

(20) 'variant 1' means the model for information provision where the information on non- daily metered and daily metered off-takes is based on apportionment of measured flows during the gas day;

(21) 'variant 2' means the model for information provision where the information on non- daily metered off-takes is a day ahead forecast

## CHAPTER II

### BALANCING SYSTEM

#### *Article 4*

##### **General principles**

1. The network users shall be responsible to balance their balancing portfolios in order to minimise the need for transmission system operators to undertake balancing actions set out under this Regulation.
2. Balancing rules established in accordance with this Regulation shall reflect genuine system needs, taking into account the resources available to transmission system operators and shall provide incentives for network users to balance their balancing portfolios efficiently.
3. Network users shall have the possibility to enter into a legally binding agreement with a transmission system operator which enables them to submit trade notifications irrespective of whether they have contracted transport capacity or not.
4. In a balancing zone where more than one transmission system operator is active, this Regulation shall apply to all the transmission system operators within that balancing zone. In case the responsibility of keeping their transmission networks in balance has been transferred to an entity, this Regulation shall apply to that entity to the extent defined under the applicable national rules.

#### *Article 5*

##### **Trade notifications and allocations**

1. Gas transfer between two balancing portfolios within one balancing zone shall be made through disposing and acquiring trade notifications submitted to the transmission system operator in respect of the gas day.
2. The timing for submitting, withdrawing and amending trade notifications shall be defined by the transmission system operator in the transport contract or other legally binding agreement with network users taking into account the time, if any, for processing the trade notifications. The transmission system operator shall enable the network users to submit trade notifications close to the time when the trade notification becomes effective.
3. The transmission system operator shall minimise the time for processing trade notifications. The time for processing shall not take more than thirty minutes except where the time when the trade notification becomes effective permits to extend the time for processing up to two hours.
4. A trade notification shall provide at least the following information:
  - (a) the gas day for which gas is transferred;
  - (b) the identification of the balancing portfolios concerned;
  - (c) whether it is a disposing or an acquiring trade notification;
  - (d) the notification quantity expressed in kWh/d for daily notification quantity or in kWh/h for hourly notification quantity, as required by the transmission system operator.

5. If the transmission system operator receives a corresponding set of a disposing and an acquiring trade notifications and the notification quantities are equal then the transmission system operator shall allocate the notification quantity to the balancing portfolios concerned:
- (a) as an off-take to the balancing portfolio of the network user making the disposing trade notification; and
  - (b) as an input to the balancing portfolio of the network user making the acquiring trade notification.
6. Where the notification quantities referred to in paragraph 5 are not equal, the transmission system operator shall either allocate the lower notification quantity specified in the relevant trade notification or shall reject both trade notifications. The applicable rule shall be defined by the transmission system operator in the applicable transport contract or other legally binding agreement.
7. A service provider shall not be prevented to act on behalf of a network user for the purpose of paragraph 5, subject to the prior approval of the transmission system operator.
8. A network user may make a trade notification on a gas day irrespective of whether any nomination was made by this network user for that gas day.
9. Paragraphs 1 to 8 shall apply, *mutatis mutandis*, to the transmission system operators trading in accordance with Article 6(3)(a).

## **CHAPTER III OPERATIONAL BALANCING**

### ***Article 6* General provisions**

1. The transmission system operator shall undertake balancing actions in order to:
- (a) maintain the transmission network within its operational limits;
  - (b) achieve an end of day linepack position in the transmission network different from the one anticipated on the basis of expected inputs and off-takes for that gas day, consistent with economic and efficient operation of the transmission network.
2. While undertaking balancing actions the transmission system operator shall consider at least the following in respect of the balancing zone:
- (a) the transmission system operator's own estimates of demand of gas over and within the gas day for which the balancing action(s) is (are) considered;
  - (b) nomination and allocation information and measured gas flows;
  - (c) gas pressures throughout the transmission network(s).
3. The transmission system operator shall undertake balancing actions through:
- (a) purchase and sale of short term standardised products on a trading platform; and/or
  - (b) the use of balancing services.
4. While undertaking balancing actions the transmission system operator shall take into account the

following principles:

- (a) the balancing actions shall be undertaken on a non-discriminatory basis;
- (b) the balancing actions shall have regard to any obligation upon transmission system operators to operate an economic and efficient transmission network.

### **Article 7**

#### **Short term standardised products**

1. The short term standardised products shall be traded for delivery on a within day or day ahead basis seven days a week in accordance with the applicable rules of the trading platform as defined between the trading platform operator and the transmission system operator.
2. The originating trading participant is the trading participant that posts a bid or an offer to trade on the trading platform and the accepting trading participant is the trading participant that accepts it.
3. Where a title product is traded:
  - (a) one trading participant makes an acquiring trade notification and the other makes a disposing trade notification;
  - (b) both trade notifications shall specify the gas quantity transferred from the trading participant who makes a disposing trade notification to the trading participant who makes an acquiring trade notification;
  - (c) where an hourly notification quantity is used, it shall be applied flat to all the remaining hours of the gas day from a specified start time and shall be equal to zero for all the hours before this start time.
4. Where a locational product is traded:
  - (a) the transmission system operator shall determine the relevant entry and exit points or groups thereof that can be used;
  - (b) all the conditions specified in paragraph 3 shall be fulfilled;
  - (c) the originating trading participant shall modify the quantity of gas to be delivered to or off-taken from the transmission network at the specified entry or exit point by an amount equal to the notification quantity and provide evidence to the transmission system operator that the quantity was modified accordingly;
5. Where a temporal product is traded:
  - (a) the conditions specified in paragraph 3(a) and (b) shall be fulfilled;
  - (b) an hourly notification quantity shall be applied to the hours of the gas day from a specified start time up to a specified end time and shall be equal to zero for all the hours before the start time and zero for all the hours after the end time.
6. Where a temporal locational product is traded, the conditions specified in paragraph 4(a), and (c) and paragraph 5 shall be fulfilled.
7. When establishing the short term standardised products, the transmission system operators from adjacent balancing zones shall cooperate in order to determine the relevant products. Each transmission system operator shall inform the relevant trading platform operators of the result of such

cooperation without undue delay.

## **Article 8**

### **Balancing services**

1. The transmission system operator is entitled to procure balancing services for those situations in which short- term standardised products will not or are not likely to provide the response necessary to keep the transmission network within its operational limits or in the absence of liquidity of trade in short term standardised products.

2. For the purpose of undertaking balancing actions through the use of balancing services, the transmission system operator when procuring these balancing services shall consider at least the following:

- (a) how balancing services will keep the transmission network within its operational limits;
- (b) the response time of the balancing services compared to the response times of any available short term standardised products;
- (c) the estimated cost of the procurement and use of balancing services compared to the estimated cost of use of any available short term standardised products;
- (d) the area at which the gas needs to be delivered;
- (e) the transmission system operator's gas quality requirements;
- (f) to what extent the procurement and use of balancing services may affect the liquidity of the short term wholesale gas market.

3. Balancing services shall be procured in a market-based manner, through a transparent and non-discriminatory public tender procedure in accordance with the applicable national rules, in particular:

- (a) prior to any commitment to contract for a balancing service, the transmission system operator shall publish a non-restrictive call for tender indicating the purpose, scope and related instructions to tenderers, to enable them to participate in the tender process;
- (b) the results shall be published without prejudice to the protection of commercially sensitive information and individual results shall be disclosed to each tenderer.

4. Under specific circumstances a transparent and non-discriminatory procedure other than a public tender may be approved by the national regulatory authority.

5. Unless a decision by the national regulatory authority allows for a longer duration of a balancing service, the duration of a balancing service shall not exceed one year and the starting date shall occur within a twelve month period from the related binding commitment of the contracting parties.

6. The transmission system operator shall review the use of its balancing services annually in order to assess whether available short term standardised products would better meet the transmission system operator's operational requirements and whether the use of balancing services could be reduced for the next year.

7. The transmission system operator shall publish annually the information with regard to the balancing services procured and the related costs incurred.

## **Article 9**

### **Merit order**

1. Subject to the principles set out in Article 6(4), when deciding upon the appropriate balancing actions, the transmission system operator, shall:

(a) prioritise the use of title products where and to the extent appropriate over any other available short term standardised products.

(b) use the other short term standardised products when the following circumstances are met:

(1) locational products when, in order to keep the transmission network within its operational limits, gas flow changes are needed at specific entry and/or exit points and/or to start from a specific period of time within the gas day.

(2) temporal products when, in order to keep the transmission network within its operational limits, gas flow changes are needed within a specific period of time within the gas day. The transmission system operator shall only use a temporal product when it would be more economic and efficient than the purchase and sale of a combination of title products or locational products.

(3) temporal locational products when, in order to keep the transmission network within its operational limits, gas flow changes are needed at specific entry and/or exit points and within a specific period of time within the gas day. The transmission system operator shall only use a temporal locational product when it would be more economic and efficient than the purchase and sale of a combination of locational products.

(c) only use balancing services where short term standardised products will not or are not likely to provide, upon assessment of the transmission system operator concerned, the response necessary to keep the transmission network within its operational limits.

The transmission system operator shall take into account cost-efficiency within the respective levels of the merit order referred to under (a)-(c).

2. While trading in short- term standardised products, the transmission system operator shall prioritise the use of within day products over day ahead products where and to the extent appropriate.

3. The transmission system operator may seek approval from the national regulatory authority to trade within an adjacent balancing zone, and have the gas transported to and from this balancing zone, as an alternative to trading title products and/or locational products in its own balancing zone(s). When deciding on granting the approval, the national regulatory authority may consider alternative solutions to improve the functioning of the domestic market. The applicable terms and conditions shall be reconsidered on an annual basis by the transmission system operator and the national regulatory authority. The use of this balancing action shall not limit the access to and use by the network users of capacity at the interconnection point concerned.

4. The transmission system operator shall publish on a yearly basis the information with regard to the costs, frequency and quantity of the balancing actions undertaken in accordance with each of the requirements set out in paragraph 1 and of the balancing actions undertaken in accordance with paragraph 3.

**Article 10****Trading platform**

1. For the purpose of procurement of short- term standardised products, the transmission system operator shall trade on a trading platform that meets all of the following criteria:

(a) provides sufficient support throughout the gas day to both the network users to trade in and the transmission system operators to undertake appropriate balancing actions through trade in the relevant short term standardised products;

(b) provides transparent and non-discriminatory access;

(c) provides services on an equal treatment basis;

(d) ensures anonymous trading at least until a transaction is concluded;

(e) provides a detailed overview of the current bids and offers to all trading participants;

(f) ensures that all trades are duly notified to the transmission system operator.

2. The transmission system operator shall endeavour to ensure that the criteria set out in paragraph 1 are met on at least one trading platform. Where the transmission system operator has been unable to ensure that these criteria are met on at least one trading platform it shall take the necessary measures towards the establishment of a balancing platform or a joint balancing platform as set out in Article 47.

3. After each trade is concluded, the trading platform operator shall make available to the trading participants sufficient details to confirm the trade.

4. The trading participant shall be responsible for submitting trade notification to the transmission system operator as defined in Article 5 unless the responsibility is assigned to the trading platform operator or a third party in accordance with the applicable rules of the trading platform.

5. The trading platform operator shall:

(a) publish the evolution of the marginal buy price and the marginal sell price after each trade without undue delay; or

(b) provide the transmission system operator with the information where the transmission system operator elects to publish the evolution of the marginal buy price and the marginal sell price. The transmission system operator shall publish this information without undue delay.

Where there is more than one trading platform operator in the same balancing zone point (b) shall apply.

6. The trading platform operator shall only allow network users to trade on its trading platform if they are entitled to make trade notifications.

7. The transmission system operator shall without undue delay inform the trading platform operator of network user's losing the right to make trade notifications pursuant to the applicable contractual arrangement in force which shall result in the suspension of the network user's right to trade on the trading platform, without prejudice to the other remedies that could be available in such case to the trading platform operator under the applicable rules of the trading platform.

**Article 11****Incentives**

1. With the view to foster the liquidity of the short term wholesale gas market, the national regulatory authority can incentivise the transmission system operator to undertake balancing actions efficiently or to maximise the undertaking of balancing actions through the trade in short term standardised products.
2. The transmission system operator may submit for approval to the national regulatory authority an incentive mechanism that shall be consistent with the general principles set out in this Regulation.
3. Prior to submitting the proposal referred to in paragraph 2, the transmission system operator may consult stakeholders upon the transmission system operator's own initiative or upon the national regulatory authority's request.
4. The incentive mechanism shall:
  - (a) be based on the transmission system operator's performance via capped payments to the transmission system operator for outperformance and by the transmission system operator for underperformance, that are measured against predetermined performance targets which may include, *inter alia*, costs targets;
  - (b) take into account the means available to the transmission system operator to control the performance;
  - (c) ensure that its application accurately reflects the allocation of responsibilities between the parties involved;
  - (d) be adapted to the state of development of the relevant gas market where it is to be implemented;
  - (e) be subject to a regular review by the national regulatory authority in close cooperation with the transmission system operator to evaluate where and to what extent changes thereto may be needed.

## **CHAPTER IV NOMINATIONS**

**Article 12****General provisions**

1. The gas quantity to be specified in the nomination and re-nomination shall be expressed either in kWh/d for daily nominations and re-nominations or in kWh/h for hourly nominations and re-nominations.
2. The transmission system operator may require network users to provide further information on nominations and re-nominations in addition to the requirements set out in this Regulation, including, *inter alia*, an accurate, updated and sufficiently detailed forecast of the expected inputs and off-takes, this in accordance with the specific need(s) of the transmission system operator.
3. Articles 13 to 16 regarding nominations and re-nominations for unbundled capacity products shall

apply *mutatis mutandis* to single nominations and re-nominations for bundled capacity products. Transmission system operators shall cooperate for the purpose of implementing nomination and re-nomination rules for bundled capacity products at interconnection points.

4. Article 15(3) and Article 17(1) shall be without prejudice to the rule for minimum interruption lead times referred to in Article 33 of Commission Regulation (EU) No 459/2017 of 16 March 2017 establishing a Network Code on Capacity Allocation Mechanisms in Gas Transmission Systems and repealing Regulation (EU) 984/2013.

### **Article 13**

#### **Information regarding nominations and re-nominations at interconnection points**

Nominations and re-nominations provided by network users to the transmission system operators with regard to interconnection points shall contain at least the following information:

- (1) interconnection point identification;
- (2) direction of the gas flow;
- (3) network user identification or, if applicable, its balancing portfolio identification;
- (4) network user's counterparty identification or, if applicable, its balancing portfolio identification;
- (5) start and end time of the gas flow for which the nomination or re-nomination is submitted;
- (6) gas day D;
- (7) the gas quantity requested to be transported.

### **Article 14**

#### **Nomination procedure at interconnection points**

1. A network user shall be entitled to submit to the transmission system operator a nomination for gas day D no later than the nomination deadline on gas day D-1. The nomination deadline shall be 13:00 UTC (winter time) or 12:00 UTC (daylight saving) on gas day D-1.

2. The last nomination received by the transmission system operator from a network user before the nomination deadline shall be taken into account by the transmission system operator.

3. The transmission system operator shall send the message regarding the confirmed quantities to the respective network users no later than the confirmation deadline on gas day D-1. The confirmation deadline shall be 15:00 UTC (winter time) or 14:00 UTC (daylight saving) on gas day D-1.

4. The transmission system operators at either side of the interconnection point may agree to offer a pre-nomination cycle within which:

- (a) network users are not obliged to submit nominations;
- (b) network users may submit to transmission system operators the nominations for gas day D no later than 12:00 UTC (winter time) or 11:00 UTC (daylight saving) on gas day D-1;
- (c) the transmission system operator shall send the message regarding the processed quantities to

the respective network users no later than 12:30 UTC (winter time) or 11:30 UTC (daylight saving) on gas day D-1.

5. In the absence of a valid nomination sent by the network user before the nomination deadline, the respective transmission system operators shall apply the default nomination rule agreed between these transmission system operators. The default nomination rule in force at an interconnection point shall be made available to the network users of the transmission system operators.

### **Article 15**

#### **Re-nomination procedure at interconnection points**

1. A network user shall be entitled to submit re-nominations within the re-nomination period which starts immediately after the confirmation deadline and ends no earlier than three hours before the end of gas day D. The transmission system operator shall start a re-nomination cycle at the start of every hour within the re-nomination period.

2. The last re-nomination received by the transmission system operator from a network user before the re-nomination cycle starts shall be taken into account by the transmission system operator in the re-nomination cycle.

3. The transmission system operator shall send the message regarding the confirmed quantities to the respective network users within two hours from the start of each re-nomination cycle. The start time of the effective gas flow change shall be two hours from the start of the re-nomination cycle, unless:

- (a) a later time is requested by the network user; or
- (b) an earlier time is allowed by the transmission system operator.

4. It shall be assumed that any change to the gas flow occurs at the start of each hour.

### **Article 16**

#### **Specific provisions at interconnection points**

1. Where daily and hourly nominations and re-nominations co-exist at an interconnection point, the transmission system operators or national regulatory authorities (as appropriate) may consult the stakeholders for the purpose of identifying whether harmonised nominations and re-nominations should be submitted at both sides of this interconnection point. This consultation shall consider at least the following:

- (a) financial impact on transmission system operators and network users;
- (b) impact on cross-border trade;
- (c) impact on the daily balancing regime at the interconnection point(s).

2. Following this consultation, the proposed changes, if any, shall be approved by the national regulatory authorities. Once the proposed changes are approved the transmission system operators shall amend accordingly the existing interconnection agreements and the transport contracts or other legally binding agreements and publish those changes.

### **Article 17**

#### **Rejection of nominations and re-nominations or amendment of the requested gas quantity at interconnection points**

1. The transmission system operator may reject:

(a) a nomination or re-nomination no later than two hours after the nomination deadline or the beginning of the re-nomination cycle in the following cases:

- (i) it does not comply with the requirements as to its content;
- (ii) it is submitted by an entity other than a network user;
- (iii) the acceptance of the daily nomination or re-nomination would result in a negative implied nomination flow rate;
- (iv) it exceeds the network user's allocated capacity;

(b) a re-nomination no later than two hours after the beginning of the re-nomination cycle in the following additional cases:

- (i) it exceeds the network user's allocated capacity for the remaining hours, unless this re-nomination is submitted in order to request interruptible capacity, where offered by the transmission system operator;
- (ii) the acceptance of the hourly re-nomination would result in an expected gas flow change before the end of the re-nomination cycle.

2. The transmission system operator shall not reject a network user's nomination and re-nomination on the sole ground that this network user's intended inputs are not equal to its intended off-takes.

3. In case a re-nomination is rejected, the transmission system operator shall use the network user's last confirmed quantity, if any.

4. Without prejudice to the specific terms and conditions applicable to interruptible capacity and capacity subject to congestion management rules, the transmission system operator may in principle only amend the gas quantity requested under a nomination and re-nomination in exceptional events, and emergency situations when there is an evident danger to system security and stability. Transmission system operators shall notify to the national regulatory authority any such action taken.

### **Article 18**

#### **Nomination and re-nomination procedure at points other than interconnection points**

1. The national regulatory authority shall, if not determined already, after consultation of the transmission system operator, determine at which points other than interconnection points nominations and re-nominations are required.

2. Where nominations and re-nominations are required at points other than interconnection points the following principles shall apply:

- (a) network users shall be entitled to submit re-nominations for the gas day;
- (b) the transmission system operator shall confirm or reject the submitted nominations and re-nominations considering the timelines referred to in Article 17.

## CHAPTER V

### DAILY IMBALANCE CHARGES

#### *Article 19*

##### **General provisions**

1. Network users shall be bound to pay or be entitled to receive (as appropriate) daily imbalance charges in relation to their daily imbalance quantity for each gas day.
2. Daily imbalance charges shall be identified separately on the transmission system operator's invoices to network users.
3. The daily imbalance charge shall be cost reflective and shall take account of the prices associated with transmission system operator's balancing actions, if any, and of the small adjustment referred to in Article 22(6).

#### *Article 20*

##### **Daily imbalance charge calculation methodology**

1. The transmission system operator shall submit the daily imbalance charge calculation methodology to be applied in its balancing zone to the national regulatory authority for approval.
2. Once approved, the daily imbalance charge calculation methodology shall be published on the relevant website. Any update thereof shall be published in a timely manner.
3. The daily imbalance charge calculation methodology shall define:
  - (a) the calculation of the daily imbalance quantity referred to in Article 21;
  - (b) the derivation of the applicable price referred to in Article 22; and
  - (c) any other necessary parameter.

#### *Article 21*

##### **Daily imbalance quantity calculation**

1. The transmission system operator shall calculate a daily imbalance quantity for each network user's balancing portfolio for each gas day in accordance with the following formula:  
daily imbalance quantity = inputs – off-takes
2. The daily imbalance quantity calculation shall be adapted accordingly where:
  - (a) a linepack flexibility service is offered; and/or
  - (b) any arrangement is in place whereby network users provide gas, including gas in kind, to cover:
    - (i) gas unaccounted for as off taken from the system, such as losses, metering errors; and/or
    - (ii) gas used by the transmission system operator for the operation of the system, such as fuel gas

3. Where the sum of a network user's inputs for the gas day is equal to the sum of its off-takes for this gas day, a network user is deemed balanced for this gas day.
4. Where the sum of a network user's inputs for the gas day is not equal to the sum of its off-takes for this gas day, a network user is deemed imbalanced for this gas day and daily imbalance charges shall be applied in accordance with Article 23.
5. The transmission system operator shall provide a network user with its initial and its final daily imbalance quantities in accordance with Article 37.
6. The daily imbalance charge shall be based on the final daily imbalance quantity.

## **Article 22**

### **Applicable price**

1. For the purpose of daily imbalance charge calculation as provided in Article 23 the applicable price shall be determined as follows:
  - (a) marginal sell price where the daily imbalance quantity is positive (i.e. the network user's inputs for that gas day exceed its off-takes for that gas day); or
  - (b) marginal buy price where the daily imbalance quantity is negative (i.e. the network user's off-takes for that gas day exceed its inputs for that gas day).
2. A marginal sell price and a marginal buy price shall be calculated for each gas day pursuant to the following:
  - (a) a marginal sell price is the lower of:
    - (i) the lowest price of any sales of title products in which the transmission system operator is involved in respect of the gas day; or
    - (ii) the weighted average price of gas in respect of that gas day, minus a small adjustment.
  - (b) a marginal buy price is the higher of:
    - (i) the highest price of any purchases of title products in which the transmission system operator is involved in respect of the gas day; or
    - (ii) the weighted average price of gas in respect of that gas day, plus a small adjustment.
3. For the purpose of determining the marginal sell price, the marginal buy price and the weighted average price, the related trades shall be made on trading platforms that are pre-identified by the transmission system operator and approved by the national regulatory authority. The weighted average price shall be the energy weighted average price of trades in title products carried out at the virtual trading point in respect of a gas day.
4. A default rule shall be defined in case paragraph 2(a) and (b) do not allow for the derivation of a marginal sell price and/or a marginal buy price.
5. Subject to the approval of the national regulatory authority, the price of locational products may be taken into account for the purpose of determining the marginal sell price, the marginal buy price and the weighted average price, where proposed by the transmission system operator with corresponding consideration of the extent of the transmission system operator's use of locational products.

6. The small adjustment shall:

- (a) incentivise network users to balance their inputs and off-takes;
- (b) be designed and applied in a non-discriminatory manner in order to:
  - (i) not deter market entry;
  - (ii) not impede the development of competitive markets;
- (c) not have a detrimental impact on cross-border trade;
- (d) not result in network users' excessive financial exposure to daily imbalance charges.

7. The value of the small adjustment may differ for determining the marginal buy price and the marginal sell price. The value of the small adjustment shall not exceed ten percent of the weighted average price unless the transmission system operator concerned can justify otherwise to the national regulatory authority and have it approved pursuant to Article 20.

### **Article 23**

#### **Daily imbalance charge**

1. To calculate daily imbalance charges for each network user, the transmission system operator shall multiply a network user's daily imbalance quantity by the applicable price determined in accordance with Article 22.

2. Daily imbalance charges shall be applied as follows:

- (a) if a network user's daily imbalance quantity for the gas day is positive then this network user shall be deemed to have sold gas to the transmission system operator equivalent to the daily imbalance quantity and therefore shall be entitled to receive a credit in respect of daily imbalance charges from the transmission system operator; and
- (b) if a network user's daily imbalance quantity for the gas day is negative then this network user shall be deemed to have purchased gas from the transmission system operator equivalent to the daily imbalance quantity and therefore shall be obliged to pay daily imbalance charges to the transmission system operator.

## **CHAPTER VI**

### **WITHIN DAY OBLIGATIONS**

#### **Article 24**

##### **General provisions**

1. A transmission system operator is only entitled to apply within day obligations in order to incentivise network users to manage their within day position in view of ensuring the system integrity of its transmission network and minimising its need to undertake balancing actions.

2. Where the transmission system operator is required to provide information to network users to

enable them to manage their exposures associated with within day positions, it shall be provided to them regularly. Where applicable, this information shall be provided upon a request submitted by each network user once.

## **Article 25**

### **Types of within day obligations**

There are three types of within day obligations, each incentivising the network user for a specific objective as set out in this Article:

#### (1) System-wide within day obligation

shall be designed to provide incentives for network users to keep the transmission network within its operational limits and shall set out the following:

- (a) the operational limits of the transmission network within which it has to remain;
- (b) the actions the network users can undertake to keep the transmission network within the operational limits;
- (c) the consequential balancing actions of the transmission system operator when the operational limits of the transmission network are approached or reached;
- (d) the attribution of costs and/or revenues to the network users and/or consequences on the within day position of these network users resulting from balancing actions undertaken by the transmission system operator;
- (e) the related charge which shall be based on the individual within day position of the network user.

#### (2) Balancing portfolio within day obligation

shall be designed to incentivise network users to keep their individual position during the gas day within a pre-defined range and shall set out the following:

- (a) for each balancing portfolio the range within which this balancing portfolio has to stay;
- (b) how the range referred to above is determined;
- (c) the consequences for network users not staying within the defined range and, where appropriate, details of how any corresponding charge is derived;
- (d) the related charge which shall be based on the individual within day position of the network user.

#### (3) Entry-exit point within day obligation

shall be designed to provide incentives for network users to limit the gas flow or the gas flow variation under specific conditions at specific entry-exit points and shall set out the following:

- (a) the limits in the gas flow and/or the gas flow variation;
- (b) the entry and/or exit point or groups of entry and/or exit points to which such limits apply;
- (c) the conditions under which such limits shall apply;
- (d) the consequences of not complying with such limits.

This obligation is additional to any other agreements with final costumers containing, amongst other things, localised specific restrictions and obligations regarding the physical gas flow.

## Article 26

### Requirements for within day obligations

1. The transmission system operator may propose to the national regulatory authority a within day obligation or an amendment thereof. It may combine features of the different types described in Article 25 provided the proposal meets the criteria set out in paragraph 2. The transmission system operator's right of proposal is without prejudice to the right of the national regulatory authority to take a decision on its own initiative.

2. Any within day obligation shall meet the following criteria:

(a) a within day obligation and related within day charge, if any, shall not pose any undue barriers on cross-border trade and new network users entering the relevant market;

(b) a within day obligation shall only be applied where the network users are provided with adequate information before a potential within day charge is applied regarding their inputs and/or off-takes and have reasonable means to respond to manage their exposure;

(c) the main costs to be incurred by the network users in relation to their balancing obligations shall relate to their position at the end of the gas day;

(d) to the extent possible, within day charges shall be reflective of the costs of the transmission system operator for the undertaking of any associated balancing actions;

(e) a within day obligation will not result in network users being financially settled to a position of zero during the gas day;

(f) the benefits of introducing a within day obligation in terms of economic and efficient operation of the transmission network outweigh any potential negative impacts thereof, including on liquidity of trades at the virtual trading point.

3. The transmission system operator may propose different within day obligations for distinct categories of entry or exit points with the aim to provide better incentives for different categories of network users in order to avoid cross subsidies. The transmission system operator's right of proposal is without prejudice to the right of the national regulatory authority to take a decision on its own initiative.

4. The transmission system operator shall consult stakeholders, including the national regulatory authorities, the affected distribution system operators and transmission system operators in adjacent balancing zones, on any within day obligation it intends to introduce, including the methodology and assumptions used in arriving at the conclusion that it meets the criteria set out in paragraph 2.

5. Following the consultation process, the transmission system operator shall produce a recommendation document which shall include the finalised proposal and an analysis of:

(a) the necessity of the within day obligation, taking into account the transmission network's characteristics and the flexibility available to the transmission system operator through purchase and sale of short term standardised products or use of balancing services in accordance with Chapter III;

(b) the information available to enable network users to manage in a timely manner their within day positions;

(c) the expected financial impact on network users;

(d) the effect on new network users entering the relevant market, including any undue negative

impact thereon;

(e) the effect on cross-border trade, including the potential impact on balancing in adjacent balancing zones;

(f) the impact on the short term wholesale gas market, including the liquidity thereof;

(g) the non-discriminatory nature of the within day obligation.

6. The transmission system operator shall submit the recommendation document to the national regulatory authority for the approval of the proposal in accordance with the procedure set out in Article 27. In parallel, the transmission system operator shall publish this recommendation document, subject to any confidentiality obligations that it may be bound by <...>.

### **Article 27**

#### **National regulatory authority decision making**

1. The national regulatory authority shall take and publish a motivated decision within six months following the receipt of the complete recommendation document. In deciding whether to approve the proposed within day obligation, the national regulatory authority shall assess whether this within day obligation meets the criteria set out in Article 26(2).

2. Before taking the motivated decision the national regulatory authority shall consult with the national regulatory authorities of adjacent **Energy Community Contracting Parties and adjacent EU** Member States and take account of their opinions. The adjacent national regulatory authority(-ies) may **consult** the **Energy Community Regulatory Board <...>** on the decision referred to in paragraph 1.

### **Article 28**

#### **Existing within day obligations**

Where the transmission system operator has within day obligation(s) at the date of **expiry of the deadline for transposition** of this Regulation, within six months from such date this transmission system operator shall follow the process set out in Article 26(5) to (7) and shall submit the within day obligation(s) to the national regulatory authority for approval in accordance with Article 27 to continue its (their) use.

## **CHAPTER VII NEUTRALITY ARRANGEMENTS**

### **Article 29**

#### **Principles of neutrality**

1. The transmission system operator shall not gain or lose by the payment and receipt of daily imbal-

ance charges, within day charges, balancing actions charges and other charges related to its balancing activities, which shall be considered as all the activities undertaken by the transmission system operator to fulfil the obligations set out in this Regulation.

2. The transmission system operator shall pass to network users:

- (a) any costs and revenues arising from daily imbalance charges and within day charges;
- (b) any costs and revenues arising from the balancing actions undertaken pursuant to Article 9, unless the national regulatory authority considers those costs and revenues as incurred inefficiently in accordance with the applicable national rules. This consideration shall be based upon an assessment which:
  - (i) shall demonstrate to what extent the transmission system operator could have reasonably mitigated the costs incurred when undertaking the balancing action; and
  - (ii) shall be made with regard to the information, the time and the tools available to the transmission system operator at the moment it decided to undertake the balancing action;
- (c) any other costs and revenues related to the balancing activities undertaken by the transmission system operator, unless the national regulatory authority considers these costs and revenues as incurred inefficiently in accordance with the applicable national rules.

3. Where an incentive to promote efficient undertaking of balancing actions is implemented, the aggregate financial loss shall be limited to the transmission system operator's inefficiently incurred costs and revenues.

4. Transmission system operators shall publish the relevant data regarding the aggregate charges referred to in paragraph 1 and the aggregate neutrality charges for balancing, at least at the same frequency as the respective charges are invoiced to network users, but no less than once per month.

5. Notwithstanding paragraphs 1 and 2, the transmission system operator in its balancing role may be subject to an incentive mechanism as referred to in Article 11.

### **Article 30**

#### **Balancing neutrality cash flows**

1. The neutrality charge for balancing shall be paid by or to the network user concerned.

2. The national regulatory authority shall set or approve and publish the methodology for the calculation of the neutrality charges for balancing, including their apportionment amongst network users and credit risk management rules.

3. The neutrality charge for balancing shall be proportionate to the extent the network user makes use of the relevant entry or exit points concerned or the transmission network.

4. The neutrality charge for balancing shall be identified separately when invoiced to network users and the invoice shall be accompanied by sufficient supporting information defined in the methodology referred to in paragraph 2.

5. Where the information model variant 2 is applied and thus the neutrality charge for balancing may be based on forecasted costs and revenues, the transmission system operator's methodology for the calculation of neutrality charge for balancing shall provide rules for a separate neutrality charge for

balancing in respect of non- daily metered off-takes.

6. Where relevant, the transmission system operator's methodology for the calculation of the neutrality charge for balancing may provide rules for the division of the neutrality charge for balancing components and the subsequent apportionment of the corresponding sums amongst the network users in order to reduce cross subsidies.

### **Article 31**

#### **Credit risk management arrangements**

1. The transmission system operator shall be entitled to take necessary measures and impose relevant contractual requirements, including financial security safeguards, on network users to mitigate their default in payment regarding any payment due for the charges referred to in Article 29 and 30.

2. The contractual requirements shall be on a transparent and equal treatment basis, proportionate to the purpose and defined in the methodology referred to in Article 30(2).

3. In case of a default attributable to a network user, the transmission system operator shall not be liable to bear any loss incurred provided the measures and requirements referred to paragraphs 1 and 2 were duly implemented and such loss shall be recovered in accordance with the methodology referred to in Article 30(2).

## **CHAPTER VIII INFORMATION PROVISION**

### **Article 32**

#### **Information obligations of transmission system operators towards the network users**

The information provided to network users by the transmission system operator shall refer to:

- (1) the overall status of the transmission network in accordance with point 3.4(5) of Annex I to Regulation (EC) No 715/2009;
- (2) the transmission system operator's balancing actions referred to in Chapter III;
- (3) the network user's inputs and off-takes for the gas day referred to in Articles 33 to 42.

### **Article 33**

#### **General provisions**

1. If not already provided by the transmission system operator according to point 3.1.2 of Annex I to Regulation (EC) No 715/2009, the transmission system operator shall provide all information referred to under Article 32 in the following manner:

- (a) on the transmission system operator's website or other system providing the information in elec-

tronic format;

(b) accessible to network users free of charge;

(c) in a user-friendly manner;

(d) clear, quantifiable and easily accessible;

(e) on a non-discriminatory basis;

(f) in consistent units either in kWh or kWh/d and kWh/h;

(g) in the official language(s) of the **Contracting Party** and in English.

2. Where a measured quantity cannot be obtained from a meter, a replacement value may be used. This replacement value shall be used as an alternative reference without any further warranty from the transmission system operator.

3. Providing access to the information shall not be construed as giving any specific warranty other than the availability of this information in a defined format and via a defined tool such as a website or web address and the related access of the network users to this information under normal conditions of use. In no circumstances shall the transmission system operators be liable to provide any further warranty, in particular as to the IT system of the network users.

4. The national regulatory authority shall decide on one information model per balancing zone. For information provision on intraday metered inputs and off-takes, the same rules shall apply to all models.

5. For balancing zones where the information model variant 2 is sought to be applied after the **expiry of the deadline for transposition** of this Regulation, a prior market consultation shall be conducted by the transmission system operator or the national regulatory authority as relevant.

### **Article 34**

#### **Intraday metered inputs and off-takes**

1. For intraday metered inputs to and off-takes from the balancing zone, where a network user's allocation equals its confirmed quantity, the transmission system operator shall not be obliged to provide information other than the confirmed quantity.

2. For intraday metered inputs to and off-takes from the balancing zone, where a network user's allocation does not equal its confirmed quantity, on gas day D the transmission system operator shall provide network users with a minimum of two updates of their measured flows for at least the aggregate intraday metered inputs and off-takes according to either of the following two options, as decided by the transmission system operator:

(a) each update covers gas flows from the beginning of this gas day D; or

(b) each update covers incremental gas flows after that reported in the previous update.

3. The first updates shall cover at least four hours of gas flow within gas day D. These updates shall be provided without undue delay and within four hours after the gas flow and no later than 17:00 UTC (winter time) or 16:00 UTC (daylight saving).

4. The time of the second update provision shall be defined upon approval by the national regulatory authority and published by the transmission system operator.

5. The transmission system operator may request the network users to indicate which of the information referred to in paragraph 2 they have access to. Based on the response received, this transmission system operator shall provide the network user with the part of information it does not have access to, in accordance with paragraphs 2 to 4.

6. Where the transmission system operator is not responsible for apportioning the gas quantities between network users as part of the allocation process, as an exception to paragraph 2, it shall provide at least information on aggregate inputs and off-takes at a minimum of two times per gas day D on that gas day D.

### **Article 35**

#### **Daily metered off-takes**

1. Where the information model variant 1 is applied, on gas day D the transmission system operator shall provide network users with a minimum of two updates of their apportionment of measured flows for at least the aggregate daily metered off-takes according to either of the following two options, as decided by the transmission system operator:

- (a) each update covers gas flows from the beginning of this gas day D; or
- (b) each update covers incremental gas flows after that reported in the previous update.

2. Each update shall be provided within two hours from the end of the final hour of gas flows.

### **Article 36**

#### **Non- daily metered off-takes**

1. Where the information model base case is applied:

(a) on gas day D-1, the transmission system operator shall provide network users with a forecast of their non- daily metered off-takes for gas day D no later than 12:00 UTC (winter time) or 11:00 UTC (daylight saving);

(b) on gas day D, the transmission system operator shall provide network users with a minimum of two updates of the forecast of their non- daily metered off-takes.

2. The first update shall be provided no later than 13:00 UTC (winter time) or 12:00 UTC (daylight saving).

3. The time of the second update provision shall be defined upon approval by the national regulatory authority and published by the transmission system operator. This shall take into consideration the following:

- (a) access to short term standardised products on a trading platform;
- (b) accuracy of the forecast of a network users non- daily off-takes as compared to the time of its provision;
- (c) time when the re-nomination period ends, as provided in Article 15(1);

(d) time of the first update of the forecast for a network user's non- daily metered off-takes.

4. Where the information model variant 1 is applied, on gas day D, the transmission system operator shall provide network users with a minimum of two updates of their apportionment of measured flows for at least the aggregate non- daily metered off-takes as referred to in Article 35.

5. Where the information model variant 2 is applied, on gas day D-1, the transmission system operator shall provide network users with a forecast of their non- daily metered off-takes for gas day D as referred to in paragraph 1(a).

### **Article 37**

#### **Inputs and off-takes after the gas day**

1. No later than the end of gas day D+1, the transmission system operator shall provide each network user with an initial allocation for its inputs and off-takes on day D and an initial daily imbalance quantity.

(a) For the information models base case and variant 1, all gas delivered to the distribution system shall be allocated;

(b) For the information model variant 2, the non- daily metered off-takes shall equal the forecast of a network user's non- daily metered off-takes provided day ahead;

(c) For the information model variant 1, an initial allocation and an initial daily imbalance quantity shall be considered as the final allocation and the final daily imbalance quantity.

2. Where an interim measure referred to in Articles 47 to 51 applies, an initial allocation and an initial daily imbalance quantity can be provided within three gas days after gas day D in case it would not be technically or operationally feasible to comply with paragraph 1.

3. The transmission system operator shall provide each network user with the final allocation for its inputs and off-takes and the final daily imbalance quantity within a period of time defined under the applicable national rules.

### **Article 38**

#### **Cost benefit analysis**

1. Within two years as from the **expiry of the deadline for transposition** of this Regulation, the transmission system operators shall assess the costs and benefits of:

(a) increasing the frequency of information provision to network users;

(b) reducing the related timelines of information provision;

(c) improving the accuracy of the information provided.

This cost benefit analysis shall specify the breakdown of costs and benefits among the categories of affected parties.

2. The transmission system operator shall consult the stakeholders on this assessment, in cooperation

with the distribution system operators where they are affected.

3. On the basis of the consultation results, the national regulatory authority shall decide on any relevant changes of information provision.

### **Article 39**

#### **Information obligations of distribution system operator(s) and forecasting party(-ies) towards the transmission system operator**

1. Each distribution system operator associated to a balancing zone and each forecasting party shall provide the transmission system operator in the respective balancing zone with the information necessary for information provision to the network users under this Regulation. This shall include inputs and off-takes on the distribution system regardless whether that system is a part of the balancing zone or not.

2. The information, its format and the procedure for its provision shall be defined in cooperation between the transmission system operator, the distribution system operator and the forecasting party, as relevant, to ensure the due provision of information by the transmission system operator to the network users under this Chapter and in particular the criteria set out in Article 33(1).

3. This information shall be provided to the transmission system operator in the same format as defined under the applicable national rules and shall be consistent with the format used by the transmission system operator to provide the information to the network users.

4. The national regulatory authority may ask the transmission system operator, the distribution system operator and the forecasting party, to propose an incentive mechanism regarding the provision of an accurate forecast for a network user's non- daily metered off-takes which shall meet the criteria set out for the transmission system operator in Article 11(4).

5. The national regulatory authority shall designate the forecasting party in a balancing zone after prior consultation with the transmission system operators and distribution system operators concerned. The forecasting party shall be responsible for forecasting a network user's non-daily metered off-takes and where appropriate its subsequent allocation. It may be a transmission system operator, distribution system operator or a third party.

### **Article 40**

#### **Information obligations of the distribution system operator(s) towards the transmission system operator**

The distribution system operator shall provide the transmission system operator with information on the intraday and daily metered inputs and off-takes on the distribution system consistent with the information requirements set out in Articles 34(2) to (6), 35 and 37. This information shall be provided to the transmission system operator within the time sufficient for the transmission system operator to provide the information to network users.

**Article 41****Information obligations of the distribution system operator(s) towards the forecasting party**

1. Distribution system operators are responsible for providing the forecasting party with sufficient and updated information for the purpose of the methodology for the forecast of a network user's non-daily metered off-takes application as set out in Article 42(2). This information shall be provided in a timely manner in accordance with the timelines defined by the forecasting party to be consistent with its needs.
2. Paragraph 1 shall apply, *mutatis mutandis*, to variant 1.

**Article 42****Information obligations of the forecasting party towards the transmission system operator**

1. The forecasting party shall provide the transmission system operator with forecasts of network user's non-daily metered off-takes and subsequent allocations consistent with the information requirements set out in Articles 36 and 37. This information shall be provided to the transmission system operator within the time sufficient for the transmission system operator to provide the information to network users and for day ahead and within day forecasts of a network user's non-daily metered off-takes no later than one hour before the deadlines referred to in Article 36(1)(a) and (b), unless a later time sufficient for the transmission system operator to provide this information to the network users is agreed by the transmission system operator and the forecasting party.
2. The methodology for the forecast of a network user's non-daily metered off-takes shall be based on a statistical demand model, with each non-daily metered off-take assigned with a load profile, consisting of a formula of the variation in gas demand versus variables such as temperature, day of week, customer type and holiday seasons. The methodology shall be subject to consultation before its adoption.
3. A report on the accuracy of the forecast of a network user's non-daily metered off-takes shall be published by the forecasting party at least every two years.
4. Where relevant, transmission system operators shall provide the data regarding gas flows within the time sufficient for the forecasting party to comply with its obligations under this Article.
5. Paragraphs 2 to 4 shall, *mutatis mutandis*, apply to variant 1.

## **CHAPTER IX**

### **LINEPACK FLEXIBILITY SERVICE**

#### ***Article 43***

##### **General provisions**

1. A transmission system operator may offer the provision of a linepack flexibility service to network users after the approval of the related terms and conditions by the national regulatory authority.
2. The terms and conditions applicable to a linepack flexibility service shall be consistent with the responsibility of a network user to balance its inputs and off-takes over the gas day.
3. The linepack flexibility service shall be limited to the level of linepack flexibility available in the transmission network and deemed not required for carrying out its function of transmission according to the concerned transmission system operator's evaluation.
4. Gas delivered to and off-taken from the transmission network by network users under this service shall be taken into account for the purpose of calculation of their daily imbalance quantity.
5. The neutrality mechanism set out in Chapter VII shall not apply to the linepack flexibility service unless otherwise decided by the national regulatory authority.
6. Network users shall notify the transmission system operator concerned of the use of the linepack flexibility service by submitting nominations and re-nominations.
7. The transmission system operator may refrain from requiring the network users to submit nominations and re-nominations referred to in paragraph 6, where the absence of such a notification does not undermine the development of the short term wholesale gas market and the transmission system operator has sufficient information to provide an accurate allocation of the use of a linepack flexibility service the following gas day.

#### ***Article 44***

##### **Conditions for provision of linepack flexibility service**

1. Linepack flexibility service can only be provided once all the following criteria are met:
  - (a) the transmission system operator shall not need to enter into any contracts with any other infrastructure provider, such as storage system operator or LNG system operator, for the purpose of provision of a linepack flexibility service;
  - (b) the revenues generated by the transmission system operator from the provision of a linepack flexibility service shall at least be equal to the costs incurred or to be incurred in providing this service;
  - (c) the linepack flexibility service shall be offered on a transparent and non-discriminatory basis and can be offered using competitive mechanisms;
  - (d) the transmission system operator shall not charge, either directly or indirectly, a network user for any costs incurred by the provision of a linepack flexibility service, should this network user not contract for it; and

(e) the provision of a linepack flexibility service shall not have a detrimental impact on cross-border trade.

2. The transmission system operator shall prioritise the reduction of within day obligations over the provision of a linepack flexibility service.

## CHAPTER X INTERIM MEASURES

### *Article 45*

#### **Interim measures: general provisions**

1. In the absence of sufficient liquidity of the short-term wholesale gas market, suitable interim measures referred to in Articles 47 to 50 shall be implemented by the transmission system operators. Balancing actions undertaken by the transmission system operator in case of interim measures shall foster the liquidity of the short-term wholesale gas market to the extent possible.

2. The resort to an interim measure is without prejudice to the implementation of any other interim measure(s) as an alternative or additionally, provided that such measures aim at promoting competition and liquidity of the short term wholesale gas market and are consistent with the general principles set out in this Regulation.

3. The interim measures referred to in paragraph 1 and 2 shall be developed and implemented by each transmission system operator, in accordance with the report, referred to in Article 46(1), approved by the national regulatory authority in accordance with the procedure set out in Article 46.

4. The report shall foresee the termination of the interim measures no later than five years as from the **expiry of the deadline for transposition** of this Regulation.

### *Article 46*

#### **Interim measures: annual report**

1. Where the transmission system operator foresees implementing or continuing to implement interim measures, it shall prepare a report which shall specify:

(a) a description of the state of development and the liquidity of the short term wholesale gas market at the time of preparing the report, including, where available to the transmission system operator, *inter alia*:

- (i) the number of transactions concluded at the virtual trading point and the number of transactions in general;
- (ii) the bid/offer spreads and the volumes of bids and offers;
- (iii) the number of participants having access to the short term wholesale gas market;
- (iv) the number of participants having been active on the short term wholesale gas market during

- a given period of time;
- (b) the interim measures to be applied
- (c) the reasons for the application of the interim measures:
- (i) an explanation why they are needed due to the state of development of the short term wholesale gas market referred to in point (b);
  - (ii) an assessment of how they will increase the liquidity of the short term wholesale gas market.
- (d) an identification of the steps that will be taken to remove the interim measures, including the criteria for making these steps and an assessment of the related timing.
2. The transmission system operator shall consult stakeholders on the proposed report.
3. Following the consultation process, the transmission system operator shall submit the report to the national regulatory authority for the approval. The first report shall be submitted within six months as from the **expiry of the deadline for transposition** of this Regulation and the subsequent reports updating it <...> shall be submitted annually.
4. The national regulatory authority shall take and publish a motivated decision within six months following the receipt of the complete report. Such a decision shall be notified, without delay, to the **Energy Community Regulatory Board and the Energy Community Secretariat**. In deciding whether to approve the report, the national regulatory authority shall assess its effect on balancing regimes' harmonisation, facilitation of market integration, ensuring non-discrimination, effective competition and the efficient functioning of the gas market.
5. The procedure as set out in Article 27(2) applies.

### **Article 47**

#### **Balancing platform**

1. Where the short term wholesale gas market has or is anticipated to have insufficient liquidity or where temporal products and locational products required by the transmission system operator cannot reasonably be procured on this market, a balancing platform shall be established for the purpose of transmission system operator balancing.
2. The transmission system operators shall consider whether a joint balancing platform may be implemented for adjacent balancing zones in the framework of cooperation between the transmission system operators or where there is sufficient interconnection capacity and such joint balancing platform is deemed efficient to be implemented. If a joint balancing platform is established, it shall be operated by the transmission system operators concerned.
3. In case the situation described under paragraph 1 has not fundamentally changed after five years the national regulatory authority may, without prejudice to Article 45(4) and after submitting the appropriate amendment of the report, decide to continue the operation of the balancing platform for another period of no more than five years.

**Article 48****Alternative to a balancing platform**

Where the transmission system operator can demonstrate that as a result of insufficient interconnection capacity between balancing zones a balancing platform cannot increase the liquidity of the short term wholesale gas market and cannot enable the transmission system operator to undertake efficient balancing actions, it may use an alternative, such as balancing services, subject to the approval by the national regulatory authority. Where such an alternative is used, the terms and conditions of the subsequent contractual arrangements as well as the applicable prices and duration shall be specified

**Article 49****Interim imbalance charge**

1. Where interim measures referred to in Article 45 are necessary, the price derivation may be calculated in accordance with the report referred to in Article 46 which shall substitute the daily imbalance charge calculation methodology.
2. In that case, the price derivation may be based upon an administered price, a proxy for a market price or a price derived from balancing platform trades.
3. The proxy for a market price shall seek to satisfy the conditions provided for in Article 22(6). The design of this proxy shall consider the potential risk for market manipulation.

**Article 50****Tolerance**

1. Tolerances may only be applied in case network users do not have access:
  - (a) to a short term wholesale gas market that has sufficient liquidity;
  - (b) to gas required to meet short term fluctuations in gas demand or supply; or
  - (c) to sufficient information regarding their inputs and off-takes.
2. Tolerances shall be applied:
  - (a) with regard to network users' daily imbalance quantity;
  - (b) on a transparent and non-discriminatory basis;
  - (c) only to the extent necessary and for the minimum duration required.
3. The application of tolerances may reduce a network user's financial exposure to the marginal sell price or the marginal buy price in respect of a part of or the network user's entire daily imbalance quantity for the gas day.
4. The tolerance level shall be the maximum quantity of gas to be bought or sold by each network user at a weighted average price. If there is a remaining quantity of gas that constitutes each network user's daily imbalance quantity which exceeds the tolerance level, it shall be sold or bought at marginal

sell price or marginal buy price.

5. The design of the tolerance level shall:

- (a) reflect the transmission network's flexibility and network user's needs;
- (b) reflect the level of risk to the network user in managing the balance of its inputs and off-takes;
- (c) not undermine the development of the short term wholesale gas market;
- (d) not result in an unduly excessive increase of the transmission system operator's balancing actions' costs.

6. The tolerance level shall be calculated on the basis of each network user's inputs and off-takes, excluding trades at the virtual trading point, for each gas day. The subcategories shall be defined under the applicable national rules.

7. The tolerance level applicable for a non- daily metered off-take defined under the applicable national rules shall be based upon the difference between the relevant forecast of a network user's non- daily metered off-takes and the allocation for non- daily metered off-take.

8. The tolerance level may include a component calculated taking into account the application of the deviation of the forecast of a network user's non- daily metered off-takes which is the amount by which the relevant forecast:

- (a) exceeds the allocation for non- daily metered off-take in case the daily imbalance quantity is positive;
- (b) is less than the allocation for non- daily metered off-take in case the daily imbalance quantity is negative.

## CHAPTER XI FINAL AND TRANSITIONAL PROVISIONS

### *Article 51*

#### **Release of surplus transmission system operator's flexibility**

1. Where long- term contracts for the procurement of flexibility in force at the date of **expiry of the deadline for transposition** of this Regulation provide the transmission system operator with a right to off-take or input specified volumes of gas, the transmission system operator shall aim to reduce these amounts of flexibility.

2. While determining the amount of surplus flexibility available for input or off-take under a long- term contract in force, the transmission system operator shall take into account the use of the short- term standardised products.

3. The surplus flexibility may be released either:

- (a) pursuant to the terms and conditions of the existing contract where it contains provisions permitting to reduce the gas quantity committed and/or to terminate the existing contract; or
- (b) as follows in the absence of such contractual rights:

(i) the contract remains in force until its termination pursuant to the applicable terms and conditions;

(ii) the contracting parties shall consider additional arrangements in order to release back to the market any surplus gas not required for balancing purposes to give access to the other network users to greater amounts of flexibility.

4. Where the contract in force provides for reducing the flexibility by amounts consistent with the surplus availability, the transmission system operator shall reduce such flexibility as soon as reasonably possible as from the **expiry of the deadline for transposition** of this Regulation or as soon as the existence of the surplus can be established.

5. The transmission system operator shall consult stakeholders on specific proposals to be implemented as interim measures for release of any surplus flexibility under a long- term contract in force.

6. The transmission system operator shall publish information on its balancing actions undertaken pursuant to the long- term contract in force.

7. The national regulatory authority may set targets for the proportion by which the long- term contracts should be reduced in order to increase the liquidity of the short term wholesale gas market.

### **Article 52**

#### **Transitional provisions**

1. The national regulatory authority may allow the transmission system operator, based on its justified request, to comply with the provisions of this Regulation within a twenty four-month period as from **12 December 2020**, provided no interim measure referred to in Chapter X is implemented by the transmission system operator. In case the national regulatory authority makes use of this possibility, this Regulation shall not apply in the balancing zone of that transmission system operator to the extent and for the duration of the transitional period laid down in the decision of the national regulatory authority.

2. The national regulatory authority shall take and publish a motivated decision in accordance with paragraph 1 within three months following the receipt of such a request. Such a decision shall be notified, without delay, to the **Energy Community Regulatory Board and the Energy Community Secretariat**.

### **Article 53**

#### **Entry into force**

<...><sup>1</sup>

<sup>1</sup> Replaced by deadlines set by PHLG Decision 2019/01/PHLG-EnC.

## **PART II**

ACQUIS COMMUNAUTAIRE

SECURITY OF SUPPLY

## DIRECTIVE 2005/89/EC of 18 January 2006 concerning measures to safeguard security of electricity supply and infrastructure investment

Incorporated and adapted by Ministerial Council Decision 2007/06/MC-EnC of 18 December 2007 on the Implementation of Directive 2005/89/EC, Directive 2004/67/EC and Regulation 1775/2005.

*The adaptations made by Ministerial Council Decision 2007/06/MC-EnC are highlighted in **bold and blue**.*

Whereas:

(1) Directive 2003/54/EC of the European Parliament and of the Council of 26 June 2003 concerning common rules for the internal market in electricity, has made a very important contribution towards the creation of the internal market for electricity. The guarantee of a high level of security of electricity supply is a key objective for the successful operation of the internal market and that Directive gives the Member States the possibility of imposing public service obligations on electricity undertakings, *inter alia*, in relation to security of supply. Those public service obligations should be defined as precisely and strictly as possible, and should not result in the creation of generation capacity that goes beyond what is necessary to prevent undue interruption of distribution of electricity to final customers.

(2) Demand for electricity is usually forecast over a medium-term period on the basis of scenarios elaborated by transmission system operators or by other organisations capable of constructing them at the request of a Member State.

(3) A competitive single EU electricity market necessitates transparent and non-discriminatory policies on security of electricity supply compatible with the requirements of such a market. The absence of such policies in individual Member States, or significant differences between the policies of the Member States would lead to distortions of competition. The definition of clear roles and responsibilities of the competent authorities, as well as of Member States themselves and all relevant market actors, is therefore crucial in safeguarding security of electricity supply and the proper functioning of the internal market while at the same time avoiding creating obstacles to market entrants, such as companies generating or supplying electricity in a Member State that have recently started their operations in that Member State, and avoiding creating distortions of the internal market for electricity or significant difficulties for market actors, including companies with small market shares, such as generators or suppliers with a very small share in the relevant Community market.

(4) Decision No 1229/2003/EC of the European Parliament and of the Council, sets out a series of guidelines for Community policy on trans-European energy networks. Regulation (EC) No 1228/2003 of the European Parliament and of the Council of 26 June 2003 on conditions for access to the network for cross-border exchanges in electricity sets out, *inter alia*, the general principles and detailed rules relating to congestion management.

(5) When promoting electricity from renewable energy sources, it is necessary to ensure the availability of associated back-up capacity, where technically necessary, in order to maintain the reliability and security of the network.

(6) In order to meet the Community's environmental commitments and to reduce its dependence on imported energy, it is important to take account of the long-term effects of growth of electricity demand.

(7) Cooperation between national transmission system operators in issues relating to network security including definition of transfer capacity, information provision and network modelling is vital to the development of a well-functioning internal market and could be further improved. A lack of coordination regarding network security is detrimental to the development of equal conditions for competition.

(8) The main intention of the relevant technical rules and recommendations, such as those contained in the Union for the Coordination of Transmission of Electricity (UCTE) Operation handbook, similar rules and recommendations developed by Nordel, the Baltic Grid Code and those for the United Kingdom and Irish systems, is to provide support for the technical operation of the interconnected network, thus contributing to meeting the need for continued operation of the network in the event of system failure at an individual point or points in the network and minimising the costs related to mitigating such supply disruption.

(9) Transmission and distribution system operators should be required to deliver a high level of service to final customers in terms of the frequency and duration of interruptions.

(10) Measures which may be used to ensure that appropriate levels of generation reserve capacity are maintained should be market-based and non-discriminatory and could include measures such as contractual guarantees and arrangements, capacity options or capacity obligations. These measures could also be supplemented by other non-discriminatory instruments such as capacity payments.

(11) In order to ensure that appropriate prior information is available, Member States should publish measures taken to maintain the balance between supply and demand among actual and potential investors in generation and among electricity consumers.

(12) Without prejudice to Articles 86, 87 and 88 of the Treaty, it is important for Member States to lay down an unambiguous, appropriate and stable framework which will facilitate security of electricity supply and is conducive to investments in generation capacity and demand management techniques. It is also important that appropriate measures are taken to ensure a regulatory framework that encourages investment in new transmission interconnection, especially between Member States.

(13) The European Council in Barcelona on 15 and 16 March 2002 agreed on a level of interconnection between Member States. Low levels of interconnection have the effect of fragmenting the market and are an obstacle to the development of competition. The existence of adequate physical transmission interconnection capacity, whether cross-border or not, is crucial but it is not a sufficient condition for competition to be fully effective. In the interest of final customers, the relation between the potential benefits of new interconnection projects and the costs for such projects should be reasonably balanced.

(14) While it is important to determine the maximum available transfer capacities without breaching the requirements of secure network operation, it is also important to ensure full transparency of the capacity calculation and allocation procedure in the transmission system. In this way, it could be possible to make better use of existing capacity, and no false shortage signals will be given to the market, which will support the achievement of a fully competitive internal market as envisaged in Directive 2003/54/EC.

(15) Transmission and distribution system operators need an appropriate and stable regulatory framework for investment, and for maintenance and renewal of the networks.

(16) Article 4 of Directive 2003/54/EC requires Member States to monitor and submit a report on security of electricity supply. This report should cover short, medium and long-term factors relevant

for security of supply including transmission system operators' intention to invest in the network. In compiling such a report, Member States will be expected to refer to information and assessments already being undertaken by transmission system operators both on an individual and collective basis, including at European level.

(17) Member States should ensure the effective implementation of this Directive.

(18) Since the objectives of the proposed action, namely secure electricity supplies based on fair competition and the creation of a fully operational internal electricity market, cannot be sufficiently achieved by the Member States and can therefore, by reason of the scale and effects of the action, be better achieved at Community level, the Community may adopt measures, in accordance with the principles of subsidiarity as set out in Article 5 of the Treaty. In accordance with the principle of proportionality, as set out in that Article, this Directive does not go beyond what is necessary in order to achieve those objectives.

## **Article 1**

### **Scope**

1. This Directive establishes measures aimed at safeguarding security of electricity supply so as to ensure the proper functioning of the internal market for electricity and to ensure:

- (a) an adequate level of generation capacity;
- (b) an adequate balance between supply and demand; and,
- (c) an appropriate level of interconnection between **Contracting Parties** for the development of the internal market.

2. It establishes a framework within which **Contracting Parties** are to define transparent, stable and non-discriminatory policies on security of electricity supply compatible with the requirements of a competitive internal market for electricity.

## **Article 2**

### **Definitions**

For the purposes of this Directive, the definitions contained in Article 2 of Directive 2003/54/EC shall apply. In addition, the following definitions shall apply:

- (a) "regulatory authority" means the regulatory authorities in **Contracting Parties**, as designated in accordance with Article 23 of Directive 2003/54/EC;
- (b) "security of electricity supply" means the ability of an electricity system to supply final customers with electricity, as provided for under this Directive;
- (c) "operational network security" means the continuous operation of the transmission and, where appropriate, the distribution network under foreseeable circumstances;
- (d) "balance between supply and demand" means the satisfaction of foreseeable demands of consumers to use electricity without the need to enforce measures to reduce consumption.

### **Article 3**

#### **General provisions**

1. **Contracting Parties** shall ensure a high level of security of electricity supply by taking the necessary measures to facilitate a stable investment climate and by defining the roles and responsibilities of competent authorities, including regulatory authorities where relevant, and all relevant market actors and publishing information thereon. The relevant market actors include, *inter alia*, transmission and distribution system operators, electricity generators, suppliers and final customers.

2. In implementing the measures referred to in paragraph 1, **Contracting Parties** shall take account of:

- (a) the importance of ensuring continuity of electricity supplies;
- (b) the importance of a transparent and stable regulatory framework;
- (c) the internal market and the possibilities for cross-border cooperation in relation to security of electricity supply;
- (d) the need for regular maintenance and, where necessary, renewal of the transmission and distribution networks to maintain the performance of the network;
- (e) the importance of ensuring proper implementation of Directive 2001/77/EC of the European Parliament and of the Council of 27 September 2001 on the promotion of electricity produced from renewable energy sources in the internal electricity market and Directive 2004/8/EC of the European Parliament and of the Council of 11 February 2004 on the promotion of cogeneration based on a useful heat demand in the internal energy market, insofar as their provisions are related to security of electricity supply;
- (f) the need to ensure sufficient transmission and generation reserve capacity for stable operation; and
- (g) the importance of encouraging the establishment of liquid wholesale markets.

3. In implementing the measures referred to in paragraph 1, **Contracting Parties** may also take account of:

- (a) the degree of diversity in electricity generation at national or relevant regional level;
- (b) the importance of reducing the long-term effects of the growth of electricity demand;
- (c) the importance of encouraging energy efficiency and the adoption of new technologies, in particular demand management technologies, renewable energy technologies and distributed generation; and
- (d) the importance of removing administrative barriers to investments in infrastructure and generation capacity.

4. **Contracting Parties** shall ensure that any measures adopted in accordance with this Directive are non-discriminatory and do not place an unreasonable burden on the market actors, including market entrants and companies with small market shares. **Contracting Parties** shall also take into account, before their adoption, the impact of the measures on the cost of electricity to final customers.

5. In ensuring an appropriate level of interconnection between **Contracting Parties**, as referred to in Article 1(1)(c), special consideration shall be given:

- (a) each **Contracting Party's** specific geographical situation;
- (b) maintaining a reasonable balance between the costs of building new interconnectors and the benefit to final customers; and
- (c) ensuring that existing interconnectors are used as efficiently as possible.

#### **Article 4**

#### **Operational network security**

1. (a) **Contracting Parties** or the competent authorities shall ensure that transmission system operators set the minimum operational rules and obligations on network security.

Before setting such rules and obligations, they shall consult with the relevant actors in the countries with which interconnection exists;

(b) notwithstanding the first subparagraph of point (a), **Contracting Parties** may require transmission system operators to submit such rules and obligations to the competent authority for approval;

(c) **Contracting Parties** shall ensure that transmission and, where appropriate, distribution system operators comply with the minimum operational rules and obligations on network security;

(d) **Contracting Parties** shall require transmission system operators to maintain an appropriate level of operational network security.

To that effect, transmission system operators shall maintain an appropriate level of technical transmission reserve capacity for operational network security and cooperate with the transmission system operators concerned to which they are interconnected.

The level of foreseeable circumstances in which security shall be maintained is defined in the operational network security rules;

(e) **Contracting Parties** shall, in particular, ensure that interconnected transmission and, where appropriate, distribution system operators exchange information relating to the operation of networks in a timely and effective fashion in line with the minimum operational requirements. The same requirements shall, where appropriate, apply to transmission and distribution system operators that are interconnected with system operators outside the **Energy Community**.

2. **Contracting Parties** or the competent authorities shall ensure that transmission and, where appropriate, distribution system operators set and meet quality of supply and network security performance objectives. These objectives shall be subject to approval by the **Contracting Parties** or competent authorities and their implementation shall be monitored by them. They shall be objective, transparent and non-discriminatory and shall be published.

3. In taking the measures referred to in Article 24 of Directive 2003/54/EC and in Article 6 of Regulation (EC) No 1228/2003, **Contracting Parties** shall not discriminate between cross-border contracts and national contracts.

4. **Contracting Parties** shall ensure that curtailment of supply in emergency situations shall be based on predefined criteria relating to the management of imbalances by transmission system operators. Any safeguard measures shall be taken in close consultation with other relevant transmission system operators, respecting relevant bilateral agreements, including agreements on the exchange of information.

### **Article 5**

#### **Maintaining balance between supply and demand**

1. **Contracting Parties** shall take appropriate measures to maintain a balance between the demand for electricity and the availability of generation capacity.

In particular, **Contracting Parties** shall:

(a) without prejudice to the particular requirements of small isolated systems, encourage the establishment of a wholesale market framework that provides suitable price signals for generation and consumption;

(b) require transmission system operators to ensure that an appropriate level of generation reserve capacity is available for balancing purposes and/or to adopt equivalent market based measures.

2. Without prejudice to Articles 87 and 88 of the Treaty, **Contracting Parties** may also take additional measures, including but not limited to the following:

(a) provisions facilitating new generation capacity and the entry of new generation companies to the market;

(b) removal of barriers that prevent the use of interruptible contracts;

(c) removal of barriers that prevent the conclusion of contracts of varying lengths for both producers and customers;

(d) encouragement of the adoption of real-time demand management technologies such as advanced metering systems;

(e) encouragement of energy conservation measures;

(f) tendering procedures or any procedure equivalent in terms of transparency and non-discrimination in accordance with Article 7(1) of Directive 2003/54/EC.

3. **Contracting Parties** shall publish the measures to be taken pursuant to this Article and shall ensure the widest possible dissemination thereof.

### **Article 6**

#### **Network investment**

1. **Contracting Parties** shall establish a regulatory framework that:

(a) provides investment signals for both the transmission and distribution system network operators to develop their networks in order to meet foreseeable demand from the market; and

(b) facilitates maintenance and, where necessary, renewal of their networks.

2. Without prejudice to Regulation (EC) No 1228/2003, **Contracting Parties** may allow for merchant investments in interconnection.

**Contracting Parties** shall ensure that decisions on investments in interconnection are taken in close cooperation between relevant transmission system operators.

## **Article 7**

### **Reporting**

1. **Contracting Parties** shall ensure that the report referred to in Article 4 of Directive 2003/54/EC covers the overall adequacy of the electricity system to supply current and projected demands for electricity, comprising:

- (a) operational network security;
- (b) the projected balance of supply and demand for the next five-year period;
- (c) the prospects for security of electricity supply for the period between five and 15 years from the date of the report; and
- (d) the investment intentions, for the next five or more calendar years, of transmission system operators and those of any other party of which they are aware, as regards the provision of cross-border interconnection capacity.

2. **Contracting Parties** or the competent authorities shall prepare the report in close cooperation with transmission system operators. Transmission system operators shall, if appropriate, consult with neighbouring transmission system operators.

3. The section of the report relating to interconnection investment intentions, referred to in paragraph 1(d), shall take account of:

- (a) the principles of congestion management, as set out in Regulation (EC) No 1228/2003;
- (b) existing and planned transmission lines;
- (c) expected patterns of generation, supply, cross-border exchanges and consumption, allowing for demand management measures, and
- (d) regional, national and European sustainable development objectives, including those projects forming part of the Axes for priority projects set out in Annex I to Decision No 1229/2003/EC.

**Contracting Parties** shall ensure that transmission system operators provide information on their investment intentions or those of any other party of which they are aware as regards the provision of cross-border interconnection capacity.

**Contracting Parties** may also require transmission system operators to provide information on investments related to the building of internal lines that materially affect the provision of cross-border interconnection.

4. **Contracting Parties** or the competent authorities shall ensure that the necessary means for access to the relevant data are facilitated to the transmission system operators and/or to the competent authorities where relevant in the development of this task.

The non-disclosure of confidential information shall be ensured.

5. On the basis of the information referred to in paragraph 1(d), received from the competent au-

thorities, the Commission shall report to the **Contracting Parties**, the competent authorities and the European Regulators Group on Electricity and Gas established by Commission Decision 2003/796/EC on the investments planned and their contribution to the objectives set out in Article 1(1).

This report may be combined with the reporting provided for in point (c) of Article 28(1) of Directive 2003/54/EC and shall be published.

### **Article 8**

#### **Transposition**

**Each Contracting Parties shall implement Directive 2005/89/EC concerning measures to safeguard security of electricity supply and infrastructure investment before 31 December 2009.<sup>1</sup>**

<...>

When **Contracting Parties**<sup>2</sup> adopt those measures, they shall contain a reference to this Directive or be accompanied by such reference on the occasion of their official publication. The methods of making such reference shall be laid down by **Contracting Parties**.

### **Article 9**

#### **Reporting<sup>3</sup>**

**The Secretariat shall monitor and review the implementation of Directive 2005/89/EC in the Contracting Parties and shall submit a progress report to the Permanent High Level Group by 30 June 2010.**

### **Articles 10 and 11**

#### **Entry into force and Addressees<sup>4</sup>**

**This Decision [2007/06/MC-EnC] enters into force on the day of its adoption and is addressed to the Contracting Parties.**

---

<sup>1</sup> The text displayed here corresponds to Article 1(1) of Decision 2007/06/MC-EnC. For the Republic of Moldova, the corresponding date is 31 December 2010, for Ukraine 1 January 2012, and for Georgia 31 December 2019.

<sup>2</sup> Decision 2007/06/MC-EnC incorporating this Directive is addressed to the Contracting Parties.

<sup>3</sup> The text displayed here corresponds to Article 1(3) of Decision 2007/06/MC-EnC.

<sup>4</sup> The text displayed here corresponds to Article 4 of Decision 2007/06/MC-EnC.

## **DIRECTIVE 2004/67/EC of 26 April 2004 concerning measures to safeguard security of natural gas supply**

Incorporated and adapted by Ministerial Council Decision 2007/06/MC-EnC of 18 December 2007 on the Implementation of Directive 2005/89/EC, Directive 2004/67/EC and Regulation 1775/2005.

*The adaptations made by Ministerial Council Decision 2007/06/MC-EnC are highlighted in **bold and blue**.*

Whereas:

(1) Natural gas (gas) is becoming an increasingly important component in Community energy supply, and, as indicated in the Green Paper "Towards a European strategy for the security of energy supply", the European Union is expected in the longer term to become increasingly dependent on gas imported from non-EU sources of supply.

(2) Following Directive 98/30/EC of the European Parliament and of the Council of 22 June 1998 concerning common rules for the internal market in natural gas and Directive 2003/55/EC of the European Parliament and of the Council of 26 June 2003 concerning common rules for the internal market in natural gas and repealing Directive 98/30/EC, the Community gas market is being liberalised. Consequently, regarding security of supply, any difficulty having the effect of reducing gas supply could cause serious disturbances in the economic activity of the Community; for this reason, there is a growing need to ensure security of gas supply.

(3) The completion of the internal gas market necessitates a minimum common approach to security of supply, in particular through transparent and non-discriminatory security of supply policies compatible with the requirements of such a market, in order to avoid market distortions. Definition of clear roles and responsibilities of all market players is therefore crucial in safeguarding security of gas supply and the well-functioning of the internal market.

(4) Security of supply obligations imposed on companies should not impede the well functioning of the internal market and should not impose unreasonable and disproportionate burden on gas market players, including new market entrants and small market players.

(5) In view of the growing gas market in the Community, it is important that the security of gas supply is maintained, in particular as regards household customers.

(6) A large choice of instruments are available for the industry and, if appropriate, for Member States, to comply with the security of supply obligations. Bilateral agreements between Member States could be one of the means to contribute to the achievement of the minimum security of supply standards, having due regard to the Treaty and secondary legislation, in particular Article 3(2) of Directive 2003/55/EC.

(7) Indicative minimum targets for gas storage could be set either at national level or by the industry. It is understood that this should not create any additional investment obligations.

(8) Considering the importance of securing gas supply, i.e. on the basis of long-term contracts, the Commission should monitor the developments on the gas market on the basis of reports from Member States.

(9) In order to meet growing demand for gas and diversify gas supplies as a condition for a compet-

itive internal gas market, the Community will need to mobilise significant additional volumes of gas over the coming decades much of which will have to come from distant sources and transported over long distances.

(10) The Community has a strong common interest with gas supplying and transit countries in ensuring continued investments in gas supply infrastructure.

(11) Long-term contracts have played a very important role in securing gas supplies for Europe and will continue to do so. The current level of long term contracts is adequate on the Community level, and it is believed that such contracts will continue to make a significant contribution to overall gas supplies as companies continue to include such contracts in their overall supply portfolio.

(12) Considerable progress has been made in developing liquid trading platforms and through gas release programmes at national level. This trend is expected to continue.

(13) The establishment of genuine solidarity between Member States in major emergency supply situations is essential, even more so as Member States become increasingly interdependent regarding security of supply.

(14) The sovereign rights of Member States over their own natural resources are not affected by this Directive.

(15) A Gas Coordination Group should be established, which should facilitate coordination of security of supply measures at Community level in the event of a major supply disruption, and may also assist member States in coordinating measures taken at a national level. In addition, it should exchange information on security of gas supply on a regular basis, and should consider aspects relevant in the context of a major supply disruption.

(16) Member States should adopt and publish national emergency provisions.

(17) This Directive should provide rules applicable in the event of a major supply disruption; the foreseeable length of such a supply disruption should cover a significant period of time of at least eight weeks.

(18) Regarding the handling of a major supply disruption, this Directive should provide for a mechanism based on a three step approach. The first step would involve the reactions of the industry to the supply disruption; if this were not sufficient, Member States should take measures to solve the supply disruption. Only if the measures taken at stage one and two have failed should appropriate measures be taken at Community level.

(19) Since the objective of this Directive, namely ensuring an adequate level for the security of gas supply, in particular in the event of a major supply disruption, whilst contributing to the proper functioning of the internal gas market, cannot, in all circumstances, be sufficiently achieved by the Member States, particularly in light of the increasing interdependency of the Member States regarding security of gas supply, and can therefore, by reason of the scale and effects of the action, be better achieved at Community level, the Community may adopt measures, in accordance with the principle of subsidiarity as set out in Article 5 of the Treaty. In accordance with the principle of proportionality, as set out in that Article, this Directive does not go beyond what is necessary in order to achieve that objective.

## **Article 1**

### **Objective**

This Directive establishes measures to safeguard an adequate level for the security of gas supply. These measures also contribute to the proper functioning of the internal gas market. It establishes a common framework within which **Contracting Parties** shall define general, transparent and non-discriminatory security of supply policies compatible with the requirements of a competitive internal gas market; clarify the general roles and responsibilities of the different market players and implement specific non-discriminatory procedures to safeguard security of gas supply.

## **Article 2**

### **Definitions**

For the purpose of this Directive:

1. "long-term gas supply contract" means a gas supply contract with a duration of more than 10 years;
2. "major supply disruption" shall mean a situation where the Community would risk to lose more than 20% of its gas supply from third countries and the situation at Community level is not likely to be adequately managed with national measures.

## **Article 3**

### **Policies for securing gas supply**

1. In establishing their general policies with respect to ensuring adequate levels of security of gas supply, **Contracting Parties** shall define the roles and responsibilities of the different gas market players in achieving these policies, and specify adequate minimum security of supply standards that must be complied with by the players on the gas market of the **Contracting Party** in question. The standards shall be implemented in a non-discriminatory and transparent way and shall be published.
2. **Contracting Parties** shall take the appropriate steps to ensure that the measures referred to in this Directive do not place an unreasonable and disproportionate burden on gas market players and are compatible with the requirements of a competitive internal gas market.
3. A non-exhaustive list of instruments for the security of gas supply is given in the Annex.

## **Article 4**

### **Security of supply for specific customers**

1. **Contracting Parties** shall ensure that supplies for household customers inside their territory are protected to an appropriate extent at least in the event of:
  - (a) a partial disruption of national gas supplies during a period to be determined by **Contracting**

**Parties** taking into account national circumstances;

(b) extremely cold temperatures during a nationally determined peak period;

(c) periods of exceptionally high gas demand during the coldest weather periods statistically occurring every 20 years,

These criteria are referred to in this Directive as “security of supply standards”.

2. **Contracting Parties** may extend the scope of paragraph 1 in particular to small and medium-sized enterprises and other customers that cannot switch their gas consumption to other energy sources, including measures for the security of their national electricity system if it depends on gas supplies.

3. A non-exhaustive list in the Annex sets out examples of instruments which may be used in order to achieve the security of supply standards.

4. **Contracting Parties**, having due regard to the geological conditions of their territory and the economic and technical feasibility, may also take the necessary measures to ensure that gas storage facilities located within their territory contribute to an appropriate degree to achieving the security of supply standards.

5. If an adequate level of interconnection is available, **Contracting Parties** may take the appropriate measures in cooperation with another **Contracting Party**, including bilateral agreements, to achieve the security of supply standards using gas storage facilities located within that other **Contracting Party**. These measures, in particular bilateral agreements, shall not impede the proper functioning of the internal gas market.

6. **Contracting Parties** may set or require the industry to set indicative minimum targets for a possible future contribution of storage, either located within or outside the **Contracting Party**, to security of supply. These targets shall be published.

## **Article 5**

### **Reporting**

1. In the report published by **Contracting Parties** pursuant to Article 5 of Directive 2003/55/EC, **Contracting Parties** shall also cover the following:

(a) the competitive impact of the measures taken pursuant to Articles 3 and 4 on all gas market players;

(b) the levels of storage capacity;

(c) the extent of long-term gas supply contracts concluded by companies established and registered on their territory, and in particular their remaining duration, based on information provided by the companies concerned, but excluding commercially sensitive information, and the degree of liquidity of the gas market;

(d) the regulatory frameworks to provide adequate incentives for new investment in exploration and production, storage, LNG and transport of gas, taking into account Article 22 of Directive 2003/55/EC as far as implemented by the **Contracting Party**.

2. This information shall be considered by the Commission in the reports that it issues pursuant to Article 31 of Directive 2003/55/EC in the light of the consequences of that Directive for the Community

as a whole and the overall efficient and secure operation of the internal gas market.

### **Article 6**

#### **Monitoring**

1. The Commission shall monitor, on the basis of the reports referred to in Article 5(1):
  - (a) the degree of new long-term gas supply import contracts from third countries;
  - (b) the existence of adequate liquidity of gas supplies;
  - (c) the level of working gas and of the withdrawal capacity of gas storage;
  - (d) the level of interconnection of the national gas systems of **Contracting Parties**;
  - (e) the foreseeable gas supply situation in function of demand, supply autonomy and available supply sources at Community level concerning specific geographic areas in the Community.
2. Where the Commission concludes that gas supplies in the Community will be insufficient to meet foreseeable gas demand in the long term, it may submit proposals in accordance with the Treaty.
3. By 19 May 2008 the Commission shall submit a review report to the European Parliament and the Council on the experience gained from the application of this Article.

### **Article 7**

#### **Gas Coordination Group<sup>1</sup>**

**For the implementation of Directive 2004/67/EC in the Contracting Parties, the coordination group referred to at its Article 7 will be set up by a Procedural Act to be adopted by the Permanent High Level Group.**

### **Article 8**

#### **National emergency measures**

1. **Contracting Parties** shall prepare in advance and, if appropriate, update national emergency measures and shall communicate these to the Commission. **Contracting Parties** shall publish their national emergency measures.
2. **Contracting Parties'** emergency measures shall ensure, where appropriate, that market players are given sufficient opportunity to provide an initial response to the emergency situation.
3. Subject to Article 4(1), **Contracting Parties** may indicate to the Chair of the Group events which they consider, because of their magnitude and exceptional character, cannot be adequately managed with national measures.

<sup>1</sup> The text displayed here corresponds to Article 2(3) of Decision 2007/06/MC-EnC. The Procedural Act referred to in this Article is Procedural Act 2008/02/MC-EnC of the Ministerial Council of the Energy Community of 11 December 2008 on the Establishment of a Security of Supply Coordination Group.

## **Article 9**

### **Community mechanism**

1. If an event occurs that is likely to develop into a major supply disruption for a significant period of time, or in the case of an event indicated by a **Contracting Party** according to Article 8(3), the Commission shall convene the Group as soon as possible, at the request of a **Contracting Party** or on its own initiative.
2. The Group shall examine, and, where appropriate, assist the **Contracting Parties** in coordinating the measures taken at national level to deal with the major supply disruption.
3. In carrying out its work, the Group shall take full account of:
  - (a) the measures taken by the gas industry as a first response to the major supply disruption;
  - (b) the measures taken by **Contracting Parties**, such as those taken pursuant to Article 4, including relevant bilateral agreements.
4. Where the measures taken at national level referred to in paragraph 3 are inadequate to deal with the effects of an event referred to in paragraph 1, the Commission may, in consultation with the Group, provide guidance to **Contracting Parties** regarding further measures to assist those **Contracting Parties** particularly affected by the major supply disruption.
5. Where the measures taken at national level pursuant to paragraph 4 are inadequate to deal with the effects of an event referred to in paragraph 1, the Commission may submit a proposal to the Council regarding further necessary measures.
6. Any measures at Community level referred to in this Article shall contain provisions aimed at ensuring fair and equitable compensation of the undertakings concerned by the measures to be taken.

## **Article 10**

### **Monitoring of implementation<sup>2</sup>**

**The Secretariat shall monitor and review the implementation of Directive 2004/67/EC in the Contracting Parties and shall submit a progress report to the Permanent High Level Group by 30 June 2010.**

## **Article 11**

### **Transposition**

**Each Contracting Parties shall implement Directive 2004/67/EC concerning measures to safeguard security of natural gas supply before 31 December 2009.<sup>3</sup>**

<...>

---

<sup>2</sup> The text displayed here corresponds to Article 2(4) of Decision 2007/06/MC-EnC.

<sup>3</sup> The text displayed here corresponds to Article 2(1) of Decision 2007/06/MC-EnC. For the Republic of Moldova, the corresponding date is 31 December 2010 and for Ukraine 1 January 2012, and for Georgia 31 December 2020.

***Article 12 and 13***

**Entry into force and Addressees<sup>4</sup>**

**This Decision [2007/06/MC-EnC] enters into force on the day of its adoption and is addressed to the Contracting Parties.**

---

<sup>4</sup> The text displayed here corresponds to Article 4 of Decision 2007/06/MC-EnC.

## ANNEX

### NON-EXHAUSTIVE LIST OF INSTRUMENTS TO ENHANCE THE SECURITY OF GAS SUPPLY REFERRED TO IN ARTICLE 3(3) AND ARTICLE 4(3)

- working gas in storage capacity,
- withdrawal capacity in gas storage,
- provision of pipeline capacity enabling diversion of gas supplies to affected areas,
- liquid tradable gas markets,
- system flexibility,
- development of interruptible demand,
- use of alternative back-up fuels in industrial and power generation plants,
- cross-border capacities,
- cooperation between transmission system operators of neighbouring **Contracting Parties** for coordinated dispatching,
- coordinated dispatching activities between distribution and transmission system operators,
- domestic production of gas,
- production flexibility,
- import flexibility,
- diversification of sources of gas supply,
- long term contracts,
- investments in infrastructure for gas import via regasification terminals and pipelines.

---

## **PART II**

ACQUIS COMMUNAUTAIRE

OIL

## **DIRECTIVE 2009/119/EC of 14 September 2009 imposing an obligation on Member States to maintain minimum stocks of crude oil and/or petroleum products**

Incorporated and adapted by Ministerial Council Decision 2012/03/MC-EnC of 18 October 2012 on the implementation of Council Directive 2009/119/EC in the Energy Community.

*The adaptations made by Ministerial Council Decision 2012/03/MC-EnC are highlighted in **bold and blue**.*

Whereas:

(1) The supply of crude oil and petroleum products to the Community remains very important, particularly for the transport sector and the chemicals industry.

(2) The increasing concentration of production, dwindling oil reserves and growing worldwide consumption of petroleum products are all contributing to an increased risk of supply difficulties.

(3) The European Council, in its Action Plan (2007 to 2009), entitled "Energy Policy for Europe", underlined the need to enhance security of supply for the European Union (EU) as a whole and for each Member State, *inter alia*, by reviewing the Union's oil stocks mechanisms, with special reference to the availability of oil in the event of a crisis.

(4) That objective requires, among other things, greater convergence between the Community system and the system provided for by the International Energy Agency (hereinafter "the IEA").

(5) Under Council Directive 2006/67/EC of 24 July 2006 imposing an obligation on Member States to maintain minimum stocks of crude oil and/or petroleum products, stocks are calculated on the basis of average daily inland consumption during the previous calendar year. However, stockholding obligations under the Agreement on an International Energy Programme of 18 November 1974 (hereinafter "the IEA Agreement") are calculated on the basis of net imports of oil and petroleum products. For that reason, and owing to other differences in methodology, the way in which stockholding obligations and Community emergency stocks are calculated should be brought more into line with the calculation methods used under the IEA Agreement, notwithstanding the facts that the IEA calculation methods may have to be evaluated in light of technological improvements during the last decades, and that non-IEA members that are fully dependent on imports may require a longer period for adapting their stockholding obligations. Further amendments to the methods and procedures for calculating stock levels may prove necessary and beneficial in order to further increase coherence with IEA practice, including, for example, changes that lead to a lowering for certain Member States of the reduction percentage of 10% applied in the calculation of stocks, that would allow a different treatment of naphtha stocks, or that would allow the stocks held in tankers in territorial waters of a Member State to be counted.

(6) Indigenous production of oil can in itself contribute to security of supply and might therefore provide justification for oil-producing Member States to hold lower stocks than other Member States. A derogation of that kind should not, however, result in stockholding obligations that differ substantially from those that apply under Directive 2006/67/EC. It therefore follows that the stockholding obligation for certain Member States should be set on the basis of inland oil consumption and not on the basis of imports.

(7) The Presidency Conclusions of the Brussels European Council of 8 and 9 March 2007 show that it is becoming increasingly vital and pressing for the Community to put in place an integrated energy policy, combining action at European and Member State level. It is therefore essential to ensure

greater convergence in the standards secured by the stockholding mechanisms in place in the various Member States.

(8) The availability of oil stocks and the safeguarding of energy supply are essential elements of public security for Member States and for the Community. The existence of central stockholding entities (CSEs) in the Community brings those goals closer. In order to allow the Member States concerned to make optimal use of national law to define the terms of reference for their CSEs while easing the financial burden placed on final consumers as a result of such stockholding activities, it is sufficient to prohibit the use of stocks for commercial purposes, while allowing stocks to be held in any location across the Community and by any CSE set up for that purpose.

(9) Given the objectives of the Community legislation on oil stocks, possible security concerns which may be expressed by some Member States and the desire to make mechanisms for solidarity amongst Member States more rigorous and more transparent, it is necessary to focus as much as possible the operation of CSEs to their national territories.

(10) It should be possible for oil stocks to be held at any location across the Community, provided that due account is taken of their physical accessibility. Consequently, economic operators on which such stockholding obligations fall should be able to discharge their obligations by delegation to other economic operators or any one of the CSEs. Furthermore, provided those obligations can be delegated to a freely chosen CSE located within the Community on payment of an amount limited to the cost of the services provided, the risk of discriminatory practices at national level will be reduced. The right of an economic operator to delegate should not imply an obligation on the part of any actor to accept the delegation, unless this Directive requires otherwise. When Member States decide to limit operators' delegation rights, they should ensure that operators are guaranteed the right to delegate a certain minimum percentage of their obligation; those Member States should therefore ensure that their CSE will accept the delegation of the stockholding obligation in respect of the amount needed to guarantee that minimum percentage.

(11) Member States should ensure full availability of all stocks held pursuant to Community legislation. In order to guarantee that availability, there should be no restrictions or limitations on the right of ownership of those stocks that could hamper their use in case of oil supply disruption. Petroleum products owned by companies facing a significant risk of enforcement proceedings against their assets should not be taken into account. Where a stockholding obligation has been imposed on operators, initiation of bankruptcy or settlement proceedings could be considered to demonstrate the existence of such a risk.

(12) In order to allow Member States to react quickly to cases of particular urgency or to local crises it might be appropriate to allow them to use a part of their stocks for such situations. Such urgent cases or local crises would not include situations caused by price developments of crude oil or petroleum products, but could include disruptions in the supply of natural gas which require fuel switching, i.e. using crude oil or petroleum products as fuel for energy production.

(13) In view of what is required in connection with setting up emergency policies, bringing about convergence in the standards secured by national stockholding mechanisms and ensuring a better overview of stock levels, particularly in the event of a crisis, Member States and the Community should have the means for reinforced control of those stocks. Stocks held under bilateral agreements, or contractual rights to purchase certain volumes of stocks (tickets) that fulfil all obligations set by the current Directive, should form useful instruments compatible with this aim of greater

convergence.

(14) Ownership of a substantial part of those stocks by the Member States or the CSEs set up by the various national authorities should make it possible to increase the level of control and transparency, at least for that part of the stocks.

(15) To help enhance security of supply in the Community, the stocks, known as “specific stocks”, purchased by the Member States or the CSEs and constituted on the basis of decisions taken by the Member States should correspond to actual needs in the event of a crisis. They should also have separate legal status to ensure full availability should such a crisis occur. To that end, the Member States concerned should ensure that appropriate steps are taken to protect those stocks unconditionally against all enforcement measures.

(16) At this stage, the volumes to be owned by the CSEs or the Member States should be set at a level determined independently and voluntarily by each of the Member States concerned.

(17) Given the need to increase the level of control and transparency, emergency stocks that are not specific stocks should be subject to increased monitoring requirements and, in certain cases, Member States should be required to notify measures governing the availability of emergency stocks and any changes in the arrangements for maintaining them.

(18) Fluctuations in the volume of specific stocks due to individual stock replacement operations could be permissible in order to allow necessary operations such as those required for ensuring freshness of the stocks, for ensuring compliance with changed product specifications, or for issuing new tenders for storage.

(19) Where emergency stocks and specific stocks are commingled with other stocks held by economic operators, transparency of emergency stock levels should be emphasised.

(20) The frequency with which stock summaries are drawn up and the deadline for their submission, as laid down by Directive 2006/67/EC, seem to be out of step with various oil stockholding systems that have been set up in other parts of the world. In a resolution on the macroeconomic impact of the increase in the price of energy, the European Parliament voiced its support for more frequent reporting.

(21) In order to prevent double reporting with regard to the information to be provided by Member States on the different product categories, Regulation (EC) No 1099/2008 of the European Parliament and of the Council of 22 October 2008 on energy statistics should serve as a point of reference for the different categories of petroleum products referred to in this Directive.

(22) In order to enhance security of supply, provide the markets with fuller information, reassure consumers about the state of oil stocks and optimise the way in which information is transmitted, provision should be made for possible subsequent amendment or clarification of the rules for the preparation and submission of statistical summaries.

(23) With the same objectives in mind, the preparation and submission of statistical summaries should also be extended to stocks other than emergency stocks and specific stocks, with those summaries to be submitted on a monthly basis.

(24) As there may be errors or discrepancies in the summaries submitted to the Commission, the Commission's employees or authorised agents should be able to review the emergency preparedness and stockholding of Member States. Member States' national regimes should be relied upon to secure that such reviews can be conducted effectively in accordance with national procedures.

(25) Complex electronic and statistical data processing should be carried out for the data received or collected. This requires the use of integrated tools and procedures. The Commission should therefore be able to take all appropriate measures to that effect, in particular developing new computer systems.

(26) The protection of individuals with regard to the processing of personal data by the Member States is governed by Directive 95/46/EC of the European Parliament and of the Council of 24 October 1995 on the protection of individuals with regard to the processing of personal data and on the free movement of such data, while the protection of individuals with regard to the processing of personal data by the Commission is governed by Regulation (EC) No 45/2001 of the European Parliament and of the Council of 18 December 2000 on the protection of individuals with regard to the processing of personal data by the Community institutions and bodies and on the free movement of such data. In particular, those acts require the processing of personal data to be justified by a legitimate purpose and stipulate that any personal data gathered accidentally must be deleted immediately.

(27) Biofuels and certain additives are often blended with petroleum products. When blended or intended to be blended with those products, it should be possible to take them into account both when calculating the stockholding obligation and when calculating the stocks held.

(28) The Member States concerned should be allowed to fulfil any obligations they may be subject to as a result of a decision to release stocks taken pursuant to the IEA Agreement or its implementing measures. A proper and timely execution of IEA decisions is a key factor for efficient response to cases of supply difficulties. In order to ensure this, Member States should release part of their emergency stocks to the extent provided for in the IEA decision in question. The Commission should cooperate closely with IEA and base action at Community level on the IEA methodology. In particular, the Commission should be in a position to recommend stock releases by all Member States, as appropriate to complement, and facilitate the implementation of, the IEA decision inviting its members to release stocks. It is appropriate for Member States to respond positively to such Commission recommendations in the interest of a strong Community-wide solidarity and cohesion, between those Member States that are members of the IEA and those that are not, in response to a supply disruption.

(29) Council Directive 73/238/EEC of 24 July 1973 on measures to mitigate the effects of difficulties in the supply of crude oil and petroleum products is intended, in particular, to offset, or at least to diminish, the adverse effects of any difficulties, even temporary, having the effect of considerably reducing supplies of crude oil or petroleum products, including the serious disruption to the economic activity of the Community that such a reduction could cause. This Directive should include similar measures.

(30) Directive 73/238/EEC also aims to set up a consultative body to facilitate the coordination of practical measures taken or proposed by the Member States in this field. Such a body should be provided for in this Directive. It remains necessary for each Member State to draw up a plan that could be used in the event of difficulties arising in the supply of crude oil and petroleum products. Each Member State should also make arrangements with regard to the organisational measures to be taken in the event of a crisis.

(31) Given that this Directive introduces a number of new mechanisms, its implementation and functioning should be reviewed.

(32) This Directive replaces or covers all of the aspects dealt with in Council Decision 68/416/EEC of 20 December 1968 on the conclusion and implementation of individual agreements between Governments relating to the obligation of Member States to maintain minimum stocks of crude oil and/or petroleum products. That Decision therefore no longer serves any purpose.

(33) Since the objective of this Directive, namely to maintain a high level of security of oil supply in the Community through reliable and transparent mechanisms based on solidarity amongst Member States while complying with the internal market and competition rules, cannot be sufficiently achieved by the Member States and can therefore, by reason of its scale and effects, be better achieved at Community level, the Community may adopt measures in accordance with the principle of subsidiarity as set out in Article 5 of the Treaty. In accordance with the principle of proportionality, as set out in that Article, this Directive does not go beyond what is necessary in order to achieve that objective.

(34) The measures necessary for the implementation of this Directive should be adopted in accordance with Council Decision 1999/468/EC of 28 June 1999 laying down the procedures for the exercise of implementing powers conferred on the Commission.

(35) In accordance with point 34 of the Interinstitutional Agreement on better law-making, Member States are encouraged to draw up, for themselves and in the interest of the Community, their own tables, illustrating, as far as possible, the correlation between this Directive and the transposition measures, and to make them public.

(36) Directives 73/238/EEC and 2006/67/EC and Decision 68/416/EEC should therefore be repealed.

## **Article 1**

### **Objective**

This Directive lays down rules aimed at ensuring a high level of security of oil supply in the Community through reliable and transparent mechanisms based on solidarity amongst Member States<sup>1</sup>, maintaining minimum stocks of crude oil and/or petroleum products and putting in place the necessary procedural means to deal with a serious shortage.

## **Article 2**

### **Definitions**

For the purposes of this Directive:

- (a) "reference year" means the calendar year of the consumption or of the net import data used to calculate either the stocks to be held or the stocks actually held at a given time;
- (b) "additives" means non-hydrocarbon compounds added to or blended with a product to modify its properties;
- (c) "biofuel" means liquid or gaseous fuel for transport produced from biomass, "biomass" being the biodegradable fraction of products, waste and residues from agriculture (including vegetable and animal substances), forestry and related industries, as well as the biodegradable fraction of

<sup>1</sup> Decision 2012/03/MC-EnC incorporating this Directive is addressed to the Contracting Parties.

industrial and municipal waste;

(d) "inland consumption" means the total quantities, calculated according to Annex II, delivered within a country for both energy and non-energy use; this aggregate includes deliveries to the transformation sector and deliveries to industry, transport, households and other sectors for "final" consumption; it also includes the own consumption of the energy sector (except refinery fuel);

(e) "effective international decision to release stocks" means any decision in force taken by the Governing Board of the International Energy Agency to make crude oil or petroleum products available to the market by a release of its members' stocks and/or additional measures;

(f) "central stockholding entity" (CSE) means the body or service upon which powers may be conferred to act to acquire, maintain or sell oil stocks, including emergency stocks and specific stocks;

(g) "major supply disruption" means a substantial and sudden drop in the supply of crude oil or petroleum products to the Community or to a Member State, irrespective of whether or not it has led to an effective international decision to release stocks;

(h) "international marine bunkers" has the meaning given in Section 2.1 of Annex A to Regulation (EC) No 1099/2008;

(i) "oil stocks" means stocks of the energy products listed in the first paragraph of Section 3.1 of Annex C to Regulation (EC) No 1099/2008;

(j) "emergency stocks" means the oil stocks that each Member State is required to maintain pursuant to Article 3;

(k) "commercial stocks" means those oil stocks held by economic operators which are not a requirement under this Directive;

(l) "specific stocks" means oil stocks that meet the criteria set out in Article 9;

(m) "physical accessibility" means arrangements for locating and transporting stocks to ensure their release or effective delivery to end users and markets within time frames and conditions conducive to alleviating the supply problems which may have arisen.

The definitions set out in this Article may be clarified or amended in accordance with the regulatory procedure referred to in Article 23(2).

### **Article 3**

#### **Emergency stocks - Calculating stockholding obligations**

1. Member States shall adopt such laws, regulations or administrative provisions as may be appropriate in order to ensure, by 31 December 2012, that the total oil stocks maintained at all times within the Community for their benefit correspond, at the very least, to 90 days of average daily net imports or 61 days of average daily inland consumption, whichever of the two quantities is greater.

2. The average daily net imports to be taken into account shall be calculated on the basis of the crude oil equivalent of imports during the previous calendar year, determined in accordance with the method and procedures set out in Annex I.

The average daily inland consumption to be taken into account shall be calculated on the basis of the crude oil equivalent of inland consumption during the previous calendar year, established and calculated in accordance with the method and procedures set out in Annex II.

3. However, notwithstanding paragraph 2, the daily averages of net imports and inland consumption, as referred to in that paragraph, shall be determined, as regards the period from 1 January to 31 March of each calendar year, on the basis of the quantities imported or consumed during the last year but one before the calendar year in question.

4. The methods and procedures for calculating stockholding obligations, as referred to in this Article, may be amended in accordance with the regulatory procedure referred to in Article 23(2).

#### **Article 4**

##### **Calculating stock levels**

1. The levels of stocks held shall be calculated using the methods set out in Annex III. When calculating stock levels for each category held pursuant to Article 9, those methods shall apply only to the products in the category in question.

2. The levels of stocks held at a given time shall be calculated using data from the reference year determined in accordance with the rules set out in Article 3.

3. Any oil stocks may be included simultaneously in both the calculation of a Member State's emergency stocks and the calculation of its specific stocks provided that those oil stocks satisfy all the conditions laid down in this Directive for both types of stocks.

4. The methods and procedures for calculating stock levels, as referred to in paragraphs 1 and 2, may be amended in accordance with the regulatory procedure referred to in Article 23(2). In particular, it may prove necessary and beneficial to amend those methods and procedures, including the application of the reduction provided for in Annex III, in order to ensure coherence with IEA practice.

#### **Article 5**

##### **Availability of stocks**

1. At all times, Member States shall ensure that emergency stocks and specific stocks are available and physically accessible for the purposes of this Directive. They shall establish arrangements for the identification, accounting and control of those stocks so as to allow them to be verified at any time. This requirement also applies to any emergency stocks and specific stocks that are commingled with other stocks held by economic operators.

Member States shall take all necessary measures to prevent all obstacles and encumbrances that could hamper the availability of emergency stocks and specific stocks. Each Member State may set limits or additional conditions on the possibility of its emergency stocks and specific stocks being held outside its territory.

2. Where there is reason to implement the emergency procedures provided for in Article 20, Member States shall prohibit, and refrain from taking, any measure hindering the transfer, use or release of emergency stocks or specific stocks held within their territory on behalf of another Member State.

### **Article 6**

#### **Register of emergency stocks - Annual report**

1. Each Member State shall keep a continually updated and detailed register of all emergency stocks held for its benefit which do not constitute specific stocks. That register shall contain, in particular, information needed to pinpoint the depot, refinery or storage facility where the stocks in question are located, as well as the quantities involved, the owner of the stocks and their nature, with reference to the categories identified in the first paragraph of Section 3.1 of Annex C to Regulation (EC) No 1099/2008.
2. By the 25th February each year, each Member State shall send the Commission a summary copy of the stock register referred to in paragraph 1 showing at least the quantities and nature of the emergency stocks included in the register on the last day of the preceding calendar year.
3. Member States shall also send the Commission a full copy of the register within 15 days of a request by the Commission; in this copy sensitive data relating to the location of stocks may be withheld. Such requests may be made no later than 5 years after the date to which the requested data relate, and may not bear upon data relating to any period preceding 1 January 2013.

### **Article 7**

#### **Central stockholding entities**

1. Member States may set up CSEs.

No Member State may set up more than one CSE or any other similar body. A Member State may set up its CSE at any location within the Community.

Where a Member State sets up a CSE, it shall take the form of a body or service without profit objective and acting in the general interest and shall not be considered to be an economic operator within the meaning of this Directive.

2. The main purpose of the CSE shall be to acquire, maintain and sell oil stocks for the purposes of this Directive or for the purpose of complying with international agreements concerning the maintenance of oil stocks. It is the only body or service upon which powers may be conferred to acquire or sell specific stocks.
3. CSEs or Member States may, for a specified period, delegate tasks relating to the management of emergency stocks and, with the exception of sale and acquisition, of specific stocks, but only to:
  - (a) another Member State within whose territory such stocks are located or the CSE set up by that Member State. Tasks thus delegated may not be subdelegated to other Member States or to CSEs set up by them. The Member State that set up the CSE, as well as each Member State within whose territory the stocks will be held, has the right to make the delegation conditional upon its authorisation;
  - (b) economic operators. Tasks thus delegated may not be subdelegated. Where such a delegation, or any change or extension to that delegation, involves tasks relating to the management of emergency and specific stocks held in another Member State, it must be authorised in advance both by the Member State on whose account the stocks are held and by all Member States within whose territories the stocks will be held.

4. Each Member State having a CSE shall require it, for the purposes of Article 8(1) and (2), to publish:

- (a) on an ongoing basis, full information, broken down by product category, on the stock volumes that it can undertake to maintain for economic operators, or, where appropriate, interested CSEs;
- (b) at least 7 months in advance, the conditions subject to which it is willing to provide services related to maintaining the stocks for economic operators. The conditions under which services may be provided, including conditions relating to scheduling, may also be determined by competent national authorities or following a competitive procedure intended to determine the best bid among operators or, where appropriate, interested CSEs.

CSEs shall accept such delegations under objective, transparent and non-discriminatory conditions. Payments by the operators for the services of the CSE shall not exceed the full costs of the services rendered and may not be required until the stocks are constituted. The CSE may make its acceptance of a delegation conditional upon the operator's provision of a guarantee or some other form of security.

### **Article 8**

#### **Economic operators**

1. Each Member State shall ensure that any economic operator on which it imposes stockholding obligations in order to fulfil its obligations under Article 3 is given the right to delegate those obligations at least in part and at the choice of the economic operator, but only to:

- (a) the CSE of the Member State on whose account such stocks are held;
- (b) one or more other CSEs which have in advance declared themselves willing to hold such stocks, provided that such delegations have been authorised in advance both by the Member State on whose account such stocks are held and by all Member States within whose territories the stocks will be held;
- (c) other economic operators which have surplus stocks or available stockholding capacity outside of the territory of the Member State on whose account the stocks are held within the Community, provided that such delegation has been authorised in advance both by the Member State on whose account such stocks are held and by all Member States within whose territories the stocks will be held; and/or
- (d) other economic operators which have surplus stocks or available stockholding capacity within the territory of the Member State on whose account the stocks are held, provided that such delegation has been communicated in advance to the Member State. Member States may impose limits or conditions on such delegations.

Obligations delegated in accordance with points (c) and (d) may not be subdelegated. Any change to or extension of a delegation referred to in points (b) and (c) shall only take effect if authorised in advance by all Member States which authorised the delegation. Any change to or extension of a delegation referred to in point (d) shall be treated as a new delegation.

2. Each Member State may restrict the delegation rights of the economic operators on which it imposes or has imposed stockholding obligations.

However, where such restrictions limit the delegation rights of an economic operator to amounts corresponding to less than 10% of the stockholding obligation imposed on it, the Member State shall ensure that it has set up a CSE that is required to accept delegations in respect of the amount needed to safeguard the right of an economic operator to delegate at least 10% of the stockholding obligation imposed on it.

The minimum percentage referred to in this paragraph shall be increased from 10% to 30% by 31 December 2017.

3. Notwithstanding the provisions of paragraphs 1 and 2, a Member State may impose an obligation on an economic operator to delegate at least part of its stockholding obligation to the CSE of the Member State.

4. Member States shall take the necessary measures to inform economic operators of the modalities to be used to calculate the stockholding obligations imposed on them no later than 200 days prior to the start of the period to which the obligation in question relates. Economic operators shall exercise their right to delegate stockholding obligations to CSEs no later than 170 days prior to the start of the period to which the obligation in question relates.

Where economic operators are informed less than 200 days before the start of the period to which the stockholding obligation relates, they may exercise their right to delegate that obligation at any time.

## **Article 9**

### **Specific stocks**

1. Each Member State may undertake to maintain a minimum level of oil stocks, calculated in terms of number of days of consumption, in accordance with the conditions set out in this Article.

Specific stocks shall be owned by the Member State or the CSE set up by it and shall be maintained on the territory of the Community.

2. Specific stocks can only be composed of one or more of the following product categories, as defined in Section 4 of Annex B to Regulation (EC) No 1099/2008:

- Ethane
- LPG
- Motor gasoline
- Aviation gasoline
- Gasoline-type jet fuel (naphtha-type jet fuel or JP4)
- Kerosene-type jet fuel
- Other kerosene
- Gas/diesel oil (distillate fuel oil)
- Fuel oil (high sulphur content and low sulphur content)
- White spirit and SBP
- Lubricants

- Bitumen
- Paraffin waxes
- Petroleum coke

3. Petroleum products constituting specific stocks shall be identified by each Member State on the basis of the categories listed in paragraph 2. Member States shall ensure that, for the reference year determined in accordance with the rules set out in Article 3 and concerning the products included in the categories used, the crude oil equivalent of quantities consumed in the Member State is at least equal to 75% of inland consumption calculated using the method set out in Annex II.

For each of the categories chosen by the Member State, the specific stocks it undertakes to maintain shall correspond to a given number of days of average daily consumption measured on the basis of their crude oil equivalent during the reference year determined in accordance with the rules set out in Article 3.

The crude oil equivalents referred to in the first and second subparagraphs are calculated by multiplying by a factor of 1.2 the sum of the aggregate “observed gross inland deliveries”, as defined in Section 3.2.1 of Annex C to Regulation (EC) No 1099/2008, for the products included in the categories used or concerned. International marine bunkers are not included in the calculation.

4. Each Member State that has decided to maintain specific stocks shall send the Commission a notice to be published in the Official Journal of the European Union, specifying the level of such stocks that it has undertaken to maintain and the duration of such undertaking which shall be at least 1 year. The notified minimum level shall apply equally to all categories of specific stocks used by the Member State.

The Member State shall ensure that such stocks are held the full length of the notified period without prejudice to the right of the Member State to undergo temporary reductions due solely to individual stock replacement operations.

The list of categories used by a Member State shall remain in effect for at least 1 year and may be amended only with effect on the first day of a calendar month.

5. Each Member State that has not made a commitment for the full length of a given calendar year to maintain at least 30 days of specific stocks shall ensure that at least one-third of their stockholding obligation is held in the form of products composed in accordance with paragraphs 2 and 3.

A Member State for which less than 30 days of specific stocks are held shall draw up an annual report analysing the measures taken by its national authorities to ensure and verify the availability and physical accessibility of its emergency stocks as referred to in Article 5 and shall document in the same report arrangements made to allow the Member State to control the use of these stocks in case of oil supply disruptions. That report shall be sent to the Commission by the end of the first month of the calendar year to which it relates.

### **Article 10**

#### **Managing specific stocks**

1. Each Member State shall keep a continually updated and detailed register of all specific stocks held within its territory. That register shall contain, in particular, all information needed to pinpoint the

exact location of the stocks in question.

Member States shall also send the Commission a copy of the register within 15 days of a request by the Commission. In this copy, sensitive data relating to the location of stocks may be withheld. Such requests may be made no later than 5 years after the date to which the requested data relate.

2. Where specific stocks are commingled with other oil stocks, Member States or their CSEs shall make the necessary arrangements to prevent those commingled products from being moved, to the extent of the proportion constituting specific stocks, without prior written authorisation by the owner of the specific stocks and by the authorities of, or the CSE established by, the Member State in whose territory the stocks are located.

3. Member States shall take the necessary measures to confer unconditional immunity from enforcement action on all specific stocks maintained or transported within their territory, irrespective of whether those stocks are owned by them or by other Member States.

### **Article 11**

#### **The effect of delegations**

The delegations referred to in Articles 7 and 8 shall in no way alter the obligations incumbent upon each Member State pursuant to this Directive.

### **Article 12**

#### **Statistical summaries of stocks covered by Article 3**

1. With regard to the levels of stocks to be held pursuant to Article 3, each Member State shall draw up statistical summaries and submit them to the Commission in accordance with the rules set out in Annex IV<sup>2</sup>.

2. The rules for drawing up the summaries referred to in paragraph 1, their scope, content and frequency and the deadlines for their submission may be amended in accordance with the regulatory procedure referred to in Article 23(2). The rules for submitting those summaries to the Commission may also be amended in accordance with the regulatory procedure referred to in Article 23(2).

3. Member States may not include quantities of crude oil or petroleum products which are subject to a seizure order or enforcement action in their statistical summaries of emergency stocks. This also applies to stocks owned by companies that are bankrupt or have entered into an arrangement with creditors.

<sup>2</sup> Pursuant to the Ministerial Council General Policy Guideline on a Roadmap on Implementation of the Certain Deadlines of the Directive 2009/119/EC, all Contracting Parties are invited to: a) "Begin regular monthly participation in the submissions of the JODI Oil Questionnaire before 1 January 2018. b) Communicate to the Secretariat by 31 March 2018 the proposed legal basis and Action Plan for collecting all oil data necessary to submit the Monthly Oil Statistics (MOS) Questionnaire".

**Article 13****Statistical summaries of specific stocks**

1. Each Member State concerned shall draw up and submit to the Commission a statistical summary, for each product category, showing the specific stocks existing on the last day of each calendar month and specifying the quantities and the number of days of average consumption in the reference year which those stocks represent. If some of those specific stocks are held outside a Member State's territory, it shall provide details of the stocks maintained in or by the various Member States and CSEs concerned. It shall also provide a detailed indication of whether it owns all of those stocks or whether they are owned, in whole or in part, by its CSE.
2. Each Member State concerned shall also draw up and submit to the Commission a summary of the specific stocks located within its territory and owned by other Member States or CSEs, showing the stocks existing on the last day of each calendar month and broken down into the product categories identified pursuant to Article 9(4). In that summary, the Member State shall also indicate, in each case, the Member State or CSE concerned and the quantities involved.
3. The statistical summaries referred to in paragraphs 1 and 2 shall be submitted during the calendar month following that to which they relate.
4. Copies of the statistical summaries shall also be sent immediately upon request by the Commission. Such requests may be made no later than 5 years after the date to which the data in question relate.
5. The scope, content and frequency of the statistical summaries and the deadlines for their submission may be amended in accordance with the regulatory procedure referred to in Article 23(2). The rules for submitting those summaries to the Commission may also be amended in accordance with the regulatory procedure referred to in Article 23(2).

**Article 14****Summaries of commercial stocks**

1. Member States shall send the Commission a monthly statistical summary of the levels of commercial stocks held within their national territory. When doing so, they shall ensure that sensitive data are protected and shall abstain from mentioning the names of the owners of the stocks concerned.
2. Using aggregate levels, the Commission shall publish a monthly statistical summary of the commercial stocks in the Community on the basis of the summaries submitted by the Member States.
3. The rules for submitting and publishing the statistical summaries, as well as for their frequency, may be amended in accordance with the regulatory procedure referred to in Article 23(2).

**Article 15****Data processing**

The Commission shall be responsible for developing, hosting, managing and maintaining the IT

resources needed to receive, store and carry out any processing of the data provided in the statistical summaries, all other information submitted by Member States or gathered by the Commission pursuant to this Directive and any data on oil stocks gathered pursuant to Regulation (EC) No 1099/2008 and needed for the purpose of drawing up the summaries required by this Directive.

### **Article 16**

#### **Biofuels and additives**

1. When calculating stockholding obligations under Articles 3 and 9 biofuels and additives shall be taken into account only where they have been blended with the petroleum products concerned.
2. When calculating the stock levels actually maintained, biofuels and additives shall be taken into account when:
  - (a) they have been blended with petroleum products concerned; or
  - (b) they are stored on the territory of the Member State concerned, provided that the Member State has adopted rules ensuring that they are to be blended with petroleum products held pursuant to stockholding requirements set out in this Directive and that they are to be used in transportation.
3. The rules for taking biofuels and additives into account when calculating stockholding obligations and stock levels, as laid down in paragraph 1 and 2, may be amended in accordance with the regulatory procedure referred to in Article 23(2).

### **Article 17**

#### **Coordination Group for oil and petroleum products**

1. A Coordination Group for oil and petroleum products is hereby set up (hereinafter the "Coordination Group"). The Coordination Group is a consultative Group that shall contribute to analysing the situation within the Community with regard to security of supply for oil and petroleum products and facilitate the coordination and implementation of measures in that field.
2. The Coordination Group shall be made up of representatives of the Member States. It shall be chaired by the Commission. Representative bodies from the sector concerned may take part in the work of the Coordination Group at the invitation of the Commission.

### **Article 18**

#### **Reviews of emergency preparedness and stockholding**

1. The Commission may, in coordination with Member States, carry out reviews to verify their emergency preparedness and, if considered appropriate by the Commission, related stockholding. When preparing for such reviews, the Commission shall take into account efforts undertaken by other institutions and international organisations and consult the Coordination Group.
2. The Coordination Group may agree on the participation of authorised agents and representatives of other Member States in the reviews. Designated national officials of the reviewed Member State

may accompany the persons performing the review. Within 1 week following the announcement of a review referred to in paragraph 1, any Member State concerned that has not provided the Commission with sensitive data relating to the location of stocks pursuant Articles 6 and 9 shall place this information at the disposal of the Commission's employees or authorised agents.

3. Member States shall ensure that their authorities and those responsible for maintaining and managing emergency and specific stocks agree to inspections and provide assistance to the persons authorised by the Commission to perform those reviews. Member States shall in particular ensure that these persons are granted the right to consult all documents and registers relating to the stocks and have right of access to all sites on which stocks are held and to all related documents.

4. The outcome of reviews carried out pursuant to this Article shall be notified to the Member State reviewed and may be forwarded to the Coordination Group.

5. Member States and the Commission shall ensure that officials, agents and other persons working under Commission supervision and members of the Coordination Group may not disclose any information which has been gathered or exchanged pursuant to this Article and which, by its nature, is covered by professional secrecy, such as the identity of the owners of stocks.

6. The objectives of the reviews referred to in paragraph 1 may not include the processing of personal data. Any personal data found or uncovered during those reviews may not be gathered or taken into consideration and, if gathered accidentally, shall be destroyed immediately.

7. Member States shall take the necessary measures to ensure that all data, records, summaries and documents relating to emergency stocks and specific stocks are kept for a period of at least 5 years.

### **Article 19**

#### **Protection of individuals with regard to the processing of data**

This Directive is without prejudice to, and in no way affects, the level of protection of individuals with regard to the processing of personal data under the provisions of Community and national law and, in particular, does not alter Member States' obligations with regard to the processing of personal data, as laid down by Directive 95/46/EC, or the obligations incumbent upon Community institutions and bodies under Regulation (EC) No 45/2001 with regard to the processing of personal data by them in the course of their duties.

### **Article 20**

#### **Emergency procedures**

1. Member States shall ensure that they have procedures in place and take such measures as may be necessary, in order to enable their competent authorities to release quickly, effectively and transparently some or all of their emergency stocks and specific stocks in the event of a major supply disruption, and to impose general or specific restrictions on consumption in line with the estimated shortages, *inter alia*, by allocating petroleum products to certain groups of users on a priority basis.

2. Member States shall at all times have contingency plans to be implemented in the event of a major supply disruption and shall provide for organisational measures to be taken to allow those plans to

be implemented. Upon request, Member States shall inform the Commission of their contingency plans and the corresponding organisational arrangements.

3. In the event of an effective international decision to release stocks affecting one or more Member States:

(a) the Member States concerned may use their emergency stocks and specific stocks to fulfil their international obligations under that decision. Any Member State so doing shall notify the Commission immediately, so that the Commission can call a meeting of the Coordination Group or consult its members by electronic means to assess, in particular, the impact of that release;

(b) the Commission should recommend to Member States to release some or all of their emergency stocks and specific stocks or to take other measures of equivalent effect as considered appropriate. The Commission may act only after consulting the Coordination Group.

4. In the absence of an effective international decision to release stocks but when difficulties arise in the supply of crude oil or petroleum products to the Community or to a Member State, the Commission shall inform the IEA where applicable, and coordinate with it as appropriate, and arrange a consultation of the Coordination Group as soon as possible, either at the request of a Member State or on its own initiative. When a consultation of the Coordination Group is requested by a Member State, it shall be arranged within 4 days of the request at most, unless the Member State agrees to a longer period. On the basis of the results of the examination of the situation by the Coordination Group, the Commission shall determine whether a major supply disruption has occurred.

If a major supply disruption is deemed to have occurred, the Commission shall authorise the release of some or all of the quantities of emergency stocks and specific stocks that have been put forward for that purpose by the Member States concerned.

5. Member States may release emergency and specific stocks below the compulsory minimum level set by this Directive in amounts immediately necessary for an initial response in cases of particular urgency or in order to meet local crises. In the event of such release, Member States shall inform the Commission immediately of the amount released. The Commission shall transmit this information to the members of the Coordination Group.

6. Where paragraphs 3, 4 or 5 are applied, Member States may temporarily hold stocks at levels lower than those stipulated in this Directive. In that case, the Commission shall determine, on the basis of the results of the consultation of the Coordination Group and, where applicable, in coordination with the IEA, and notably by taking into account the situation on the international oil and petroleum products markets, a reasonable time frame within which Member States must bring their stocks back up to the minimum required levels.

7. Decisions taken by the Commission by virtue of this Article shall be without prejudice to any other international obligations on the Member States concerned.

## **Article 21**

### **Penalties**

Member States shall lay down the rules on penalties applicable to infringements of the national provisions adopted pursuant to this Directive and shall take such measures as may be necessary to ensure that they are applied. Such penalties shall be effective, proportionate and dissuasive. The

Member States shall notify those provisions to the Commission by 31 December 2012 and shall notify it without delay of any subsequent amendment affecting them.

## **Article 22**

### **Review**

**The Secretariat shall monitor and review the preparation of the implementation of Directive 2009/119/EC in the Contracting Parties and shall submit an annual progress report to the Ministerial Council, the first of which shall be submitted in 2013.<sup>3</sup>**

## **Article 23**

### **Committee procedure**

1. The Commission shall be assisted by a Committee.
2. Where reference is made to this paragraph, Articles 5 and 7 of Decision 1999/468/EC shall apply.

## **Article 24**

### **Repeal**

<...>

## **Article 25**

### **Transposition**

1. Member States shall bring into force the laws, regulations and administrative provisions necessary to comply with this Directive by 1 January 2023<sup>4</sup>.

By derogation from the first subparagraph, Member States that are not members of the IEA by 31 December 2012 and cover their inland consumption of petroleum products fully by imports shall bring into force the laws, regulations and administrative provisions necessary to comply with Article 3(1) of this Directive by 31 December 2014. Until those Member States have brought into force such measures, they shall maintain oil stocks corresponding to 81 days of average daily net imports.

When Member States adopt measures, they shall contain a reference to this Directive or shall be accompanied by such reference on the occasion of their official publication. The methods of making such a reference shall be laid down by the Member States.

2. Member States shall communicate to the Commission the text of the main provisions of national

<sup>3</sup> The text displayed here corresponds to Article 3 of Ministerial Council Decision 2012/03/MC.

<sup>4</sup> The date displayed here corresponds to Article 3 of Ministerial Council Decision 2012/03/MC. Pursuant to the Ministerial Council General Policy Guideline on a Roadmap on Implementation of the Certain Deadlines of the Directive 2009/119/EC, 'the Contracting Parties are invited to communicate to the Secretariat by 31 March 2017 the text of the main provisions of the draft national law which they intend to adopt to transpose Directive 2009/119/EC and the Action Plan on the Establishment of Oil Stocks. All Contracting Parties are invited bring into force the laws, regulations and administrative provisions necessary to comply with this Directive by 31 December 2017'.

law which they adopt in the field covered by this Directive.

<sup>5</sup> The text displayed here corresponds to Article 4 of Ministerial Council Decision 2012/03/MC.

## ANNEX I

### METHOD FOR CALCULATING THE CRUDE OIL EQUIVALENT OF IMPORTS OF PETROLEUM PRODUCTS

The crude oil equivalent of imports of petroleum products, as referred to in Article 3, must be calculated using the following method:

The crude oil equivalent of imports of petroleum products is obtained by calculating the sum of the net imports of crude oil, NGL, refinery feedstocks and other hydrocarbons as defined in Section 4 of Annex B to Regulation (EC) No 1099/2008, adjusting the result to take account of any stock changes, deducting 4% for naphtha yield (or, if the average naphtha yield within the national territory is greater than 7%, deducting the net actual consumption of naphtha or the average naphtha yield) and adding this to the net imports of all other petroleum products excluding naphtha, also adjusted to take account of stock changes and multiplied by a factor of 1.065.

International marine bunkers are not included in the calculation.

## **ANNEX II**

### **METHOD FOR CALCULATING THE CRUDE OIL EQUIVALENT OF INLAND CONSUMPTION**

For the purpose of Article 3, the crude oil equivalent of inland consumption must be calculated using the following method:

Inland consumption is the sum of the aggregate “observed gross inland deliveries”, as defined in Section 3.2.1 of Annex C to Regulation (EC) No 1099/2008, of the following products only: motor gasoline, aviation gasoline, gasoline-type jet fuel (naphtha-type jet fuel or JP4), kerosene-type jet fuel, other kerosene, gas/diesel oil (distillate fuel oil) and fuel oil (high sulphur content and low sulphur content) as defined in Section 4 of Annex B to Regulation (EC) No 1099/2008.

International marine bunkers are not included in the calculation.

The crude oil equivalent of inland consumption is calculated by multiplying by a factor of 1.2.

## ANNEX III

### METHODS FOR CALCULATING THE LEVEL OF STOCKS HELD

The following methods must be used to calculate stock levels:

Without prejudice to the case addressed in Article 4(3), no quantity may be counted as stock more than once.

Crude oil stocks are reduced by 4%, which corresponds to the average naphtha yield.

Stocks of naphtha and petroleum products for international marine bunkers are not included.

Other petroleum products are included in the stock count using one of the two methods set out below. Member States must continue to use the method they have chosen throughout the whole calendar year in question.

Member States may:

(a) include all other stocks of the petroleum products identified in the first paragraph of Section 3.1 of Annex C to Regulation (EC) No 1099/2008 and calculate the crude oil equivalent by multiplying the quantities by a factor of 1.065; or

(b) include stocks of only the following products: motor gasoline, aviation gasoline, gasoline-type jet fuel (naphtha-type jet fuel or JP4), kerosene-type jet fuel, other kerosene, gas/diesel oil (distillate fuel oil) and fuel oil (high sulphur content and low sulphur content) and calculate the crude oil equivalent by multiplying the quantities by a factor of 1.2.

The calculation may include quantities held:

- in refinery tanks,
- in bulk terminals,
- in pipeline tankage,
- in barges,
- in intercoastal tankers,
- in oil tankers in port,
- in inland ship bunkers,
- in storage tank bottoms,
- as working stocks,
- by large consumers as required by law or otherwise controlled by governments.

However, those quantities except for any held in refinery tanks, in pipeline tankage or in bulk terminals, may not be included when calculating levels of specific stocks where such stocks are calculated separately from emergency stocks.

The calculation may never include:

(a) crude oil not yet produced;

(b) quantities held:

- in pipelines,
- in rail tank cars,

- in seagoing ships' bunkers,
- in service stations and retail stores,
- by other consumers,
- in tankers at sea,
- as military stocks.

When calculating their stocks, Member States must reduce the quantities of stocks calculated as set out above by 10%. That reduction applies to all quantities included in a given calculation.

However, no 10% reduction is to be applied when calculating the level of specific stocks or the levels of the different categories of specific stocks where those stocks or categories are considered separately from the emergency stocks, particularly with a view to verifying compliance with the minimum levels laid down by Article 9.

## ANNEX IV

### **RULES FOR THE PREPARATION AND SUBMISSION TO THE COMMISSION OF STATISTICAL SUMMARIES OF STOCKS TO BE HELD PURSUANT TO ARTICLE 3**

Each Member State must draw up and submit to the Commission, on a monthly basis, a definitive statistical summary of the level of stocks actually held on the last day of the calendar month, calculated either on the basis of the number of days of net oil imports or on the basis of the number of days of inland oil consumption, in accordance with Article 3. The statistical summary must provide precise details of why the calculation is based on the number of days of imports or, conversely, on the number of days of consumption and must specify which of the calculation methods set out in Annex III was used.

If some of the stocks included when calculating the level of stocks held pursuant to Article 3 are held outside national territory, each summary shall give details of the stocks held by the various Member States and CSEs concerned on the last day of the period to which it relates. In its summary, each Member State must also indicate, in each case, whether the stocks are being held pursuant to a delegation request made by one or more economic operators or whether they are being held at its request or at the request of its CSE.

For any stocks held by a Member State within its territory on behalf of other Member States or CSEs, that Member State must draw up and submit to the Commission a summary showing the stocks existing on the last day of each calendar month, broken down by product category. In that summary, the Member State must also indicate, in particular, the Member State or CSE concerned and the quantities involved in each case.

The statistical summaries referred to in this Annex must be submitted to the Commission within 55 days of the end of the month to which they relate. Those same summaries must also be submitted within 2 months of a request by the Commission. Such requests may be made no later than 5 years after the date to which the data relate.

## **RECOMMENDATION OF THE MINISTERIAL COUNCIL OF THE ENERGY COMMUNITY of 3 January 2018 on preparing for the implementation of Directive 98/70/EC relating to the quality of petrol and diesel fuels and amending Council Directive 93/12/EEC**

The Ministerial Council of the Energy Community

Having regard to the Treaty establishing the Energy Community (“the Treaty”), and in particular Articles 2, 25, 76 and 79 thereof,

Having regard to the proposal from the European Commission<sup>1</sup>

Whereas:

(1) Article 2 of the Treaty defines the improvement of the environmental situation related to Network Energy in the Contracting Parties as one of its key objectives;

(2) In accordance with Article 1(2) of Ministerial Council Decision 2008/03/MC-EnC, “Network Energy” as mentioned in Article 2(2) of the Treaty shall be understood as to include the oil sector, i.e. the supply, trade, processing and transmission of crude oil and petroleum products falling within the scope of Directive 2006/67/EC and the related pipelines, storage, refineries and import/export facilities;

(3) Petrol and diesel fuels covered by the scope of Directive 98/70/EC are significant contributors to emissions into the air and therefore there are strong links between related regulation and the environmental objective enshrined in Article 2 of the Treaty;

(4) For their full and legally binding incorporation in the Energy Community, provisions contained in Directive 98/70/EC would need to be adapted in accordance with Article 24 of the Treaty;

(5) The framework for regional cooperation established by the Energy Community and the assistance offered by its institutions and bodies can be essential in preparing the successful implementation of Directive 98/70/EC;

(6) The Environmental Task Force, at its meetings of 8 June 2017 and 25 October 2017, discussed and endorsed the present Recommendation;

(7) The Permanent High Level Group, at its meeting of 30 June 2017, discussed and endorsed the present Recommendation,

---

<sup>1</sup> C(2017) 7954 final, 23.11.2017.

HEREBY RECOMMENDS:

**Article 1**

1. Contracting Parties should prepare the legal and institutional preconditions for the implementation of the core elements of Directive 98/70/EC in their jurisdictions.
2. The Secretariat should assist the Contracting Parties' efforts in this respect. It should report to the Ministerial Council on the progress annually.

**Article 2**

1. In the framework of the Environmental Task Force, the Contracting Parties, the Secretariat and the European Commission should identify the provisions of Directive 98/70/EC suitable for incorporation in the Energy Community, the necessary adaptations as well as appropriate deadlines.
2. The European Commission should regularly inform the Contracting Parties and the Secretariat on possible amendments to Directive 98/70/EC.

**Article 3**

Subject to a proposal by the European Commission, the Ministerial Council will decide on the adoption of a decision incorporating suitable provisions of Directive 98/70/EC.

**Article 4**

This Recommendation enters into effect upon its adoption by the Ministerial Council.

**Article 5**

This Recommendation is addressed to the Contracting Parties and institutions of the Treaty.

Done by written procedure on 3 January 2018

---

## **PART II**

ACQUIS COMMUNAUTAIRE

INFRASTRUCTURE

## **REGULATION (EU) 347/2013 of 17 April 2013 on guidelines for trans-European energy infrastructure and repealing Decision 1364/2006/EC and amending Regulations (EC) 713/2009, (EC) 714/2009 and (EC) 715/2009**

Incorporated and adapted by Ministerial Council Decision 2015/09/MC-EnC of 16 October 2015 on the implementation of Regulation (EU) 347/2013 of the European Parliament and of the Council on guidelines for trans-European energy infrastructure.

*The adaptations made by Ministerial Council Decision 2015/09/MC-EnC are highlighted in **bold and blue**.*

Whereas:

(1) On 26 March 2010, the European Council agreed to the Commission's proposal to launch a new strategy 'Europe 2020'. One of the priorities of the Europe 2020 strategy is sustainable growth to be achieved by promoting a more resource-efficient, more sustainable and more competitive economy. That strategy put energy infrastructures at the forefront as part of the flagship initiative 'Resource efficient Europe', by underlining the need to urgently upgrade Europe's networks, interconnecting them at the continental level, in particular to integrate renewable energy sources.

(2) The target agreed in the conclusions of the March 2002 Barcelona European Council for Member States to have a level of electricity interconnections equivalent to at least to 10% of their installed production capacity has not yet been achieved.

(3) The communication from the Commission entitled 'Energy infrastructure priorities for 2020 and beyond - A Blueprint for an integrated European energy network', followed by the Council conclusions of 28 February 2011 and the European Parliament resolution, called for a new energy infrastructure policy to optimise network development at European level for the period up to 2020 and beyond, in order to allow the Union to meet its core energy policy objectives of competitiveness, sustainability and security of supply.

(4) The European Council of 4 February 2011 underlined the need to modernise and expand Europe's energy infrastructure and to interconnect networks across borders, in order to make solidarity between Member States operational, to provide for alternative supply or transit routes and sources of energy and to develop renewable energy sources in competition with traditional sources. It insisted that no Member State should remain isolated from the European gas and electricity networks after 2015 or see its energy security jeopardised by lack of the appropriate connections.

(5) Decision No 1364/2006/EC of the European Parliament and of the Council lays down guidelines for trans-European energy networks (TEN-E). Those guidelines have as objectives to support the completion of the Union internal energy market while encouraging the rational production, transportation, distribution and use of energy resources, to reduce the isolation of less-favoured and island regions, to secure and diversify the Union's energy supplies, sources and routes, including through cooperation with third countries, and to contribute to sustainable development and protection of the environment.

(6) Evaluation of the current TEN-E framework has clearly shown that this framework, while making a positive contribution to selected projects by giving them political visibility, lacks vision, focus, and flexibility to fill identified infrastructure gaps. The Union should therefore increase its efforts to meet

future challenges in this field, and due attention should be paid to identifying potential future gaps in energy demand and supply.

(7) Accelerating the refurbishment of existing energy infrastructure and the deployment of new energy infrastructure is vital to achieve the Union's energy and climate policy objectives, consisting of completing the internal market in energy, guaranteeing security of supply, in particular for gas and oil, reducing greenhouse gas emissions by 20% (30% if the conditions are right), increasing the share of renewable energy in final energy consumption to 20% and achieving a 20% increase in energy efficiency by 2020 whereby energy efficiency gains may contribute to reducing the need for construction of new infrastructures. At the same time, the Union has to prepare its infrastructure for further decarbonisation of its energy system in the longer term towards 2050. This Regulation should therefore also be able to accommodate possible future Union energy and climate policy objectives.

(8) Despite the fact that Directive 2009/72/EC of the European Parliament and of the Council of 13 July 2009 concerning common rules for the internal market in electricity and Directive 2009/73/EC of the European Parliament and of the Council of 13 July 2009 concerning common rules for the internal market in natural gas provide for an internal market in energy, the market remains fragmented due to insufficient interconnections between national energy networks and to the sub-optimal utilisation of existing energy infrastructure. However, Union-wide integrated networks and deployment of smart grids are vital for ensuring a competitive and properly functioning integrated market, for achieving an optimal utilisation of energy infrastructure, for increased energy efficiency and integration of distributed renewable energy sources and for promoting growth, employment and sustainable development.

(9) The Union's energy infrastructure should be upgraded in order to prevent technical failure and to increase its resilience against such failure, natural or man-made disasters, adverse effects of climate change and threats to its security, in particular as regards European critical infrastructures as set out in Council Directive 2008/114/EC of 8 December 2008 on the identification and designation of European critical infrastructures and the assessment of the need to improve their protection.

(10) Transporting oil through land pipelines rather than over water can make an important contribution to lowering the environmental risk associated with the transportation of oil.

(11) The importance of smart grids in achieving the Union's energy policy objectives has been acknowledged in the communication from the Commission of 12 April 2011 entitled 'Smart grids: from innovation to deployment'.

(12) Energy storage facilities and reception, storage and regasification or decompression facilities for liquefied natural gas (LNG) and compressed natural gas (CNG) have an increasingly important role to play in the European energy infrastructure. The expansion of such energy infrastructure facilities forms an important component of a well-functioning network infrastructure.

(13) The communication from the Commission of 7 September 2011 entitled 'The EU Energy Policy: Engaging with Partners beyond Our Borders' underlined the need for the Union to include the promotion of energy infrastructure development in its external relations with a view to supporting socio-economic development beyond the Union borders. The Union should facilitate infrastructure projects linking the Union's energy networks with third-country networks, in particular with neighbouring countries and with countries with which the Union has established specific energy cooperation.

(14) To ensure voltage and frequency stability, particular attention should be focused on the stability

of the European electricity network under the changing conditions caused by the growing inflow of energy from renewable resources that are variable in nature.

(15) The investment needs up to 2020 in electricity and gas transmission infrastructures of European relevance have been estimated at about EUR 200 billion. The significant increase in investment volumes compared to past trends and the urgency of implementing the energy infrastructure priorities requires a new approach in the way energy infrastructures, and in particular those of a cross-border nature, are regulated and financed.

(16) The Commission Staff Working Paper for the Council of 10 June 2011 entitled 'Energy infrastructure investment needs and financing requirements' stressed that approximately half of the total investments needed for the decade up to 2020 are at risk of not being delivered at all or not in time due to obstacles related to the granting of permits, regulatory issues and financing.

(17) This Regulation lays down rules for the timely development and interoperability of trans-European energy networks in order to achieve the energy policy objectives of the Treaty on the Functioning of the European Union (TFEU) to ensure the functioning of the internal energy market and security of supply in the Union, to promote energy efficiency and energy saving and the development of new and renewable forms of energy, and to promote the interconnection of energy networks. By pursuing these objectives, this Regulation contributes to smart, sustainable and inclusive growth and brings benefits to the entire Union in terms of competitiveness and economic, social and territorial cohesion.

(18) It is essential for the development of trans-European networks and their effective interoperability to ensure operational coordination between electricity transmission system operators (TSOs). In order to ensure uniform conditions for the implementation of the relevant provisions of Regulation (EC) No 714/2009 of the European Parliament and of the Council of 13 July 2009 on conditions for access to the network for cross-border exchanges in electricity in this respect, implementing powers should be conferred on the Commission. Those powers should be exercised in accordance with Regulation (EU) No 182/2011 of the European Parliament and of the Council of 16 February 2011 laying down the rules and general principles concerning mechanisms for control by Member States of the Commission's exercise of implementing powers. The examination procedure should be used for the adoption of the guidelines on the implementation of operational coordination between electricity TSOs at Union level, given that those guidelines will apply generally to all TSOs.

(19) The Agency for the Cooperation of Energy Regulators (the 'Agency') established by Regulation (EC) No 713/2009 of the European Parliament and of the Council is allocated important additional tasks under this Regulation and should be given the right to levy fees for some of these additional tasks.

(20) Following close consultations with all Member States and stakeholders, the Commission has identified 12 strategic trans-European energy infrastructure priorities, the implementation of which by 2020 is essential for the achievement of the Union's energy and climate policy objectives. These priorities cover different geographic regions or thematic areas in the field of electricity transmission and storage, gas transmission, storage and liquefied or compressed natural gas infrastructure, smart grids, electricity highways, carbon dioxide transport and oil infrastructure.

(21) Projects of common interest should comply with common, transparent and objective criteria in view of their contribution to the energy policy objectives. For electricity and gas, in order to be eligible for inclusion in the second and subsequent Union lists, projects should be part of the latest

available 10-year network development plan. This plan should notably take account of the conclusions of the European Council of 4 February 2011 with regard to the need to integrate peripheral energy markets.

(22) Regional groups should be established for the purpose of proposing and reviewing projects of common interest, leading to the establishment of regional lists of projects of common interest. In order to ensure broad consensus, these regional groups should ensure close cooperation between Member States, national regulatory authorities, project promoters and relevant stakeholders. The cooperation should rely as much as possible on existing regional cooperation structures of national regulatory authorities and TSOs and other structures established by the Member States and the Commission. In the context of this cooperation, national regulatory authorities should, when necessary, advise the regional groups, *inter alia* on the feasibility of the regulatory aspects of proposed projects and on the feasibility of the proposed timetable for regulatory approval.

(23) In order to ensure that the Union list of projects of common interest ('Union list') is limited to projects which contribute the most to the implementation of the strategic energy infrastructure priority corridors and areas, the power to adopt and review the Union list should be delegated to the Commission in accordance with Article 290 of the TFEU, while respecting the right of the Member States to approve projects of common interest related to their territory. According to analysis carried out in the impact assessment accompanying the proposal that has led to this Regulation, the number of such projects is estimated at some 100 in the field of electricity and 50 in the field of gas. Taking into account this estimate, and the need to ensure the achievement of the objectives of this Regulation, the total number of projects of common interest should remain manageable, and therefore should not significantly exceed 220. The Commission, when preparing and drawing up delegated acts, should ensure the simultaneous, timely and appropriate transmission of relevant documents to the European Parliament and to the Council.

(24) A new Union list should be established every two years. Projects of common interest that are completed or that no longer fulfil the relevant criteria and requirements as set out in this Regulation should not appear on the next Union list. For that reason, existing projects of common interest that are to be included in the next Union list should be subject to the same selection process for the establishment of regional lists and for the establishment of the Union list as proposed projects; however, care should be taken to minimise the resulting administrative burden as much as possible, for example by using to the extent possible information submitted previously, and by taking account of the annual reports of the project promoters.

(25) Projects of common interest should be implemented as quickly as possible and should be closely monitored and evaluated, while keeping the administrative burden for project promoters to a minimum. The Commission should nominate European coordinators for projects facing particular difficulties.

(26) Permit granting processes should neither lead to administrative burdens which are disproportionate to the size or complexity of a project, nor create barriers to the development of the trans-European networks and market access. The conclusions of the Council of 19 February 2009 highlighted the need to identify and remove barriers to investment, including by means of streamlining of planning and consultation procedures. Those conclusions were reinforced by the conclusions of the European Council of 4 February 2011 which again underlined the importance of streamlining and improving permit granting processes while respecting national competences.

(27) The planning and implementation of Union projects of common interest in the areas of energy, transport and telecommunication infrastructure should be coordinated to generate synergies whenever to do so makes sense from an overall economic, technical, environmental or spatial planning point of view and with due regard to the relevant safety aspects. Thus, when the various European networks are being planned, preference could be given to integrating transport, communication and energy networks in order to ensure that as little land as possible is taken up, whilst ensuring, where possible, that existing or disused routes are reused, in order to reduce to a minimum any negative social, economic, environmental and financial impact.

(28) Projects of common interest should be given 'priority status' at national level to ensure rapid administrative treatment. Projects of common interest should be considered by competent authorities as being in the public interest. Authorisation should be given to projects which have an adverse impact on the environment, for reasons of overriding public interest, when all the conditions under Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora and Directive 2000/60/EC of the European Parliament and of the Council of 23 October 2000 establishing a framework for Community action in the field of water policy are met.

(29) The establishment of a competent authority or authorities integrating or coordinating all permit granting processes ('one-stop shop') should reduce complexity, increase efficiency and transparency and help enhance cooperation among Member States. Upon their designation, the competent authorities should be operational as soon as possible.

(30) Despite the existence of established standards for the participation of the public in environmental decision-making procedures, additional measures are needed to ensure the highest possible standards of transparency and public participation for all relevant issues in the permit granting process for projects of common interest.

(31) The correct and coordinated implementation of Directive 2011/92/EU of the European Parliament and of the Council of 13 December 2011 on the assessment of the effects of certain public and private projects on the environment, of Directive 2001/42/EC of the European Parliament and of the Council of 27 June 2001 on the assessment of the effects of certain plans and programmes on the environment, where applicable, of the Convention on access to information, public participation in decision-making and access to justice in environmental matters, signed in Aarhus on 25 June 1998 (the 'Aarhus Convention'), and of the Espoo Convention on environmental impact assessment in a transboundary context (the 'Espoo Convention') should ensure the harmonisation of the main principles for the assessment of environmental effects, including in a cross-border context. Member States should coordinate their assessments for projects of common interest, and provide for joint assessments, where possible. Member States should be encouraged to exchange best practice and administrative capacity-building for permit granting processes.

(32) It is important to streamline and improve permit granting processes, while respecting — to the extent possible with due regard to the principle of subsidiarity — national competences and procedures for the construction of new infrastructure. Given the urgency of developing energy infrastructures, the simplification of permit granting processes should be accompanied by a clear time-limit for the decision to be taken by the respective authorities regarding the construction of the project. That time limit should stimulate a more efficient definition and handling of procedures, and should under no circumstances compromise the high standards for the protection of the environment and public participation. With regard to the maximum time limits established by this Regulation, Member States could nevertheless strive to further shorten them if feasible. The competent authorities should

ensure compliance with the time limits, and Member States should endeavour to ensure that appeals challenging the substantive or procedural legality of a comprehensive decision are handled in the most efficient way possible.

(33) Where Member States consider it appropriate, they may include in the comprehensive decision decisions taken in the context of: negotiations with individual landowners to granting access to, ownership of, or a right to occupy property; spatial planning which determines the general land use of a defined region, includes other developments such as highways, railways, buildings and nature protection areas, and is not undertaken for the specific purpose of the planned project; granting of operational permits. In the context of the permit granting processes, a project of common interest could include related infrastructure to the extent that it is essential for the construction or functioning of the project.

(34) This Regulation, in particular the provisions on permit granting, public participation and the implementation of projects of common interest, should apply without prejudice to international and Union law, including provisions to protect the environment and human health, and provisions adopted under the Common Fisheries and Maritime Policy.

(35) The costs for the development, construction, operation and maintenance of projects of common interest should in general be fully borne by the users of the infrastructure. Projects of common interest should be eligible for cross-border cost allocation when an assessment of market demand or of the expected effects on the tariffs have indicated that costs cannot be expected to be recovered by the tariffs paid by the infrastructure users.

(36) The basis for the discussion on the appropriate allocation of costs should be the analysis of the costs and benefits of an infrastructure project on the basis of a harmonised methodology for energy-system-wide analysis, in the framework of the 10-year network development plans prepared by the European Networks of Transmission System Operators under Regulation (EC) No 714/2009 and Regulation (EC) No 715/2009 of the European Parliament and of the Council of 13 July 2009 on conditions for access to the natural gas transmission networks, and reviewed by the Agency. That analysis could take into consideration indicators and corresponding reference values for the comparison of unit investment costs.

(37) In an increasingly integrated internal energy market, clear and transparent rules for cost allocation across borders are necessary in order to accelerate investment in cross-border infrastructure. The European Council of 4 February 2011 recalled the importance of promoting a regulatory framework attractive to investment in networks, with tariffs set at levels consistent with financing needs and the appropriate cost allocation for cross-border investments, while enhancing competition and competitiveness and taking account of the impact on consumers. When deciding on cross-border cost allocation, national regulatory authorities should ensure that its impact on national tariffs does not represent a disproportionate burden for consumers. The national regulatory authorities should also avoid the risks of double support for projects by taking into account actual or estimated charges and revenues. Those charges and revenues should be taken into account only insofar as they are designed to cover the costs concerned and as much as possible related to the projects. When an investment request takes into account benefits beyond the borders of the Member States concerned, the national regulatory authorities should consult the TSOs concerned on the project-specific cost-benefit analysis.

(38) The existing internal energy market law requires that tariffs for access to gas and electricity net-

works provide appropriate incentives for investment. When applying the internal energy market law, national regulatory authorities should ensure a stable and predictable regulatory framework with incentives for projects of common interest, including long-term incentives, that are commensurate with the level of specific risk of the project. This applies in particular to innovative transmission technologies for electricity allowing for large scale integration of renewable energy, of distributed energy resources or of demand response in interconnected networks, and to gas transmission infrastructure offering advanced capacity or additional flexibility to the market to allow for short-term trading or back-up supply in case of supply disruptions.

(39) This Regulation applies only to the granting of permits for, public participation in, and the regulatory treatment of projects of common interest within the meaning set out herein. Member States may nevertheless apply, by virtue of their national law, the same or similar rules to other projects which do not have the status of projects of common interest within the scope of this Regulation. As regards the regulatory incentives, Member States may apply, by virtue of their national law, the same or similar rules to projects of common interest falling under the category of electricity storage.

(40) Member States that currently do not provide for a legal status of the highest national significance possible that is attributable to energy infrastructure projects in the context of permit granting processes should consider introducing such a status, in particular by evaluating if this would lead to a quicker permit granting process.

(41) The European Energy Programme for Recovery (EEPR), established by Regulation (EC) No 663/2009 of the European Parliament and of the Council has demonstrated the added value of leveraging private funding through significant Union financial assistance to allow the implementation of projects of European significance. The European Council of 4 February 2011 recognised that some energy infrastructure projects may require limited public finance to leverage private funding. In the light of the economic and financial crisis and budgetary constraints, targeted support, through grants and financial instruments, should be developed under the next multiannual financial framework, which will attract new investors into the energy infrastructure priority corridors and areas, while keeping the budgetary contribution of the Union to a minimum. The relevant measures should draw on the experience gained during the pilot phase following the introduction of project bonds to finance infrastructure projects.

(42) Projects of common interest in the fields of electricity, gas and carbon dioxide should be eligible to receive Union financial assistance for studies and, under certain conditions, for works as soon as such funding becomes available under the relevant Regulation on a Connecting Europe Facility in the form of grants or in the form of innovative financial instruments. This will ensure that tailor-made support can be provided to those projects of common interest which are not viable under the existing regulatory framework and market conditions. It is important to avoid any distortion of competition, in particular between projects contributing to the achievement of the same Union priority corridor. Such financial assistance should ensure the necessary synergies with the Structural Funds, which will finance smart energy distribution networks of local or regional importance. A three-step logic applies to investments in projects of common interest. First, the market should have the priority to invest. Second, if investments are not made by the market, regulatory solutions should be explored, if necessary the relevant regulatory framework should be adjusted, and the correct application of the relevant regulatory framework should be ensured. Third, where the first two steps are not sufficient to deliver the necessary investments in projects of common interest, Union financial assistance could be granted if the project of common interest fulfils the applicable eligibility criteria.

(43) Since the objective of this Regulation, namely the development and interoperability of trans-European energy networks and connection to such networks, cannot be sufficiently achieved by the Member States and can therefore be better achieved at Union level, the Union may adopt measures, in accordance with the principle of subsidiarity as set out in Article 5 of the Treaty on European Union. In accordance with the principle of proportionality, as set out in that Article, this Regulation does not go beyond what is necessary in order to achieve that objective.

(44) Regulations (EC) No 713/2009, (EC) No 714/2009 and (EC) No 715/2009 should therefore be amended accordingly.

(45) Decision No 1364/2006/EC should therefore be repealed.

## CHAPTER I GENERAL PROVISIONS

### *Article 1*

#### Subject matter and scope

**1. This Regulation lays down guidelines for the timely development and interoperability of projects of Energy Community Interest.**

2. In particular, this Regulation:

(a) **addresses the identification of projects of Energy Community interest falling under energy infrastructure categories in electricity, gas and oil as well as the thematic area ‘smart grid deployment’ set out in Annex I (energy infrastructure categories and area’);**

(b) facilitates the timely implementation of projects of **Energy Community** interest by streamlining, coordinating more closely, and accelerating permit granting processes and by enhancing public participation;

(c) provides rules and guidance for the cross-border allocation of costs and risk-related incentives for projects of **Energy Community** interest;

(d) **determines the conditions for eligibility of projects of Energy Community interest for Union technical and financial assistance from the Instrument for Pre-Accession Assistance (IPA) and the Neighbourhood Investment Facility.**

### *Article 2*

#### Definitions

For the purpose of this Regulation, in addition to the definitions provided for in Directives 2009/28/EC, 2009/72/EC and 2009/73/EC, Regulations (EC) No 713/2009, (EC) No 714/2009, and (EC) No 715/2009, the following definitions shall apply:

**1. ‘energy infrastructure’ means any physical equipment or facility under the energy infrastructure categories which is located within the Contracting Parties or linking Contracting Parties, or linking Contracting Parties and Member States;**

2. 'comprehensive decision' means the decision or set of decisions taken by a **Contracting Party** authority or authorities not including courts or tribunals, that determines whether or not a project promoter is to be granted authorisation to build the energy infrastructure to realise a project without prejudice to any decision taken in the context of an administrative appeal procedure;
3. 'project' means one or several lines, pipelines, facilities, equipments or installations falling under the energy infrastructure categories;
4. **'project of Energy Community interest' means a project necessary to implement the energy infrastructure and which is part of the list of projects of Energy Community interest referred to in Article 3;**
5. 'energy infrastructure bottleneck' means limitation of physical flows in an energy system due to insufficient transmission capacity, which includes *inter alia* the absence of infrastructure;
6. 'project promoter' means one of the following:
  - (a) a TSO, distribution system operator or other operator or investor developing a project of **Energy Community** interest;
  - (b) where there are several TSOs, distribution system operators, other operators, investors, or any group thereof, the entity with legal personality under the applicable national law, which has been designated by contractual arrangement between them and which has the capacity to undertake legal obligations and assume financial liability on behalf of the parties to the contractual arrangement;
7. 'smart grid' means an electricity network that can integrate in a cost efficient manner the behaviour and actions of all users connected to it, including generators, consumers and those that both generate and consume, in order to ensure an economically efficient and sustainable power system with low losses and high levels of quality, security of supply and safety;
8. 'works' means the purchase, supply and deployment of components, systems and services including software, the carrying out of development and construction and installation activities relating to a project, the acceptance of installations and the launching of a project;
9. 'studies' means activities needed to prepare project implementation, such as preparatory, feasibility, evaluation, testing and validation studies, including software, and any other technical support measure including prior action to define and develop a project and decide on its financing, such as reconnaissance of the sites concerned and preparation of the financial package;
10. 'national regulatory authority' means a national regulatory authority designated in accordance with Article 35(1) of Directive 2009/72/EC or Article 39(1) of Directive 2009/73/EC, **as incorporated and adapted by Ministerial Council Decision 2011/02/MC-EnC;**
11. 'commissioning' means the process of bringing a project into operation once it has been constructed.

## CHAPTER II

### PROJECTS OF ENERGY COMMUNITY INTEREST

#### *Article 3*

#### List of projects of Energy Community interest

1. **This Regulation establishes two Groups as set out in Annex II.1. The membership of each Group shall be based on the categories as set out in Annex I. Decision-making powers in the Groups shall be restricted to the Parties to the Treaty who shall, for those purposes, be referred to as the decision-making body of the Groups.**

2. Each Group shall adopt its own rules of procedure, having regard to the provisions set out in **Annex II.**

3. **The decision-making body of each Group shall adopt a preliminary list of proposed projects of Energy Community interest drawn up according to the process set out in Annex II.2, according to their fulfilment of the criteria set out in Article 4.**

When a Group draws up its **preliminary** list:

(a) each individual proposal for a project of **Energy Community** interest **shall require the approval of the Contracting Parties or Member States**, to whose territory the project relates; **if a Contracting Party or a Member State decides not to give its approval**, it shall present its substantiated reasons for doing so to the Group concerned;

(b) it shall take into account advice from the **Energy Community Secretariat** that is aimed at having a manageable total number of projects of **Energy Community** interest.

4. **The Ministerial Council shall establish the list of projects of Energy Community interest ('Energy Community list') by way of a Decision under Title III of the Treaty.**

In exercising its power, the **Ministerial Council** shall ensure that the **Energy Community** list is established every two years, on the basis of the **preliminary** lists adopted by the decision-making bodies of the Groups as established in **Annex II.1(2)**, following the procedure set out in paragraph 3 of this Article.

**The next Energy Community list following the one adopted by the Ministerial Council on 24 October 2013 shall be adopted by 31 December 2016.**

5. The **Ministerial Council** shall, when adopting the **Energy Community** list on the basis of the **preliminary** lists:

(a) ensure that only those projects that fulfil the criteria referred to in Article 4 are included;

(b) ensure cross-regional consistency, taking into account the opinion of the **Regulatory Board** as referred to in **Annex II.2(10)**;

(c) **take into account any opinions of Contracting Parties and Member States concerned, as referred to in Annex II.2(7); and**

(d) aim for a manageable total number of projects of **Energy Community** interest on the **Energy Community** list.

6. Projects of **Energy Community** interest included on the **Energy Community** list pursuant to

paragraph 4 of this Article **shall be submitted with the view to become** an integral part of the relevant regional investment plans under Article 12 of Regulations (EC) No 714/2009 and (EC) No 715/2009 and of the relevant national 10-year network development plans under Article 22 of Directives 2009/72/EC and 2009/73/EC and other national infrastructure plans concerned, as appropriate. Those projects shall be conferred the highest possible priority within each of those plans.

#### **Article 4**

##### **Criteria for projects of Energy Community interest**

1. Projects of **Energy Community** interest shall meet the following general criteria:
  - (a) **the project falls in at least one of the energy infrastructure categories and area as described in Annex I;**
  - (b) the potential overall benefits of the project, assessed according to the respective specific criteria in paragraph 2, outweigh its costs, including in the longer term; and
  - (c) the project meets any of the following criteria:
    - (i) **involves at least two Contracting Parties or a Contracting Party and a Member State by directly crossing the border of two or more Contracting Parties, or of one Contracting Party and one or more Member States;**
    - (ii) is located on the territory of one **Contracting Party** and has a significant cross-border impact as set out in **Annex III.1**;
    - (iii) <...><sup>1</sup>
2. The following specific criteria shall apply to projects of **Energy Community** interest falling within specific energy infrastructure categories:
  - (a) for electricity transmission and storage projects falling under the energy infrastructure categories set out in **Annex I.1(a)**, **(b)** and **(c)**, the project is to contribute significantly to at least one of the following specific criteria:
    - (i) market integration <...> and reducing energy infrastructure bottlenecks; competition and system flexibility;
    - (ii) sustainability, *inter alia* through the integration of renewable energy into the grid and the transmission of renewable generation to major consumption centres and storage sites;
    - (iii) security of supply, *inter alia* through interoperability, appropriate connections and secure and reliable system operation;
  - (b) for gas projects falling under the energy infrastructure categories set out in **Annex I.2**, the project is to contribute significantly to at least one of the following specific criteria:
    - (i) market integration <...> and reducing energy infrastructure bottlenecks; interoperability and system flexibility;
    - (ii) security of supply, *inter alia* through appropriate connections and diversification of supply sources, supplying counterparts and routes;
    - (iii) competition, *inter alia* through diversification of supply sources, supplying counterparts and

<sup>1</sup> Not applicable according to Article 8(1)(a)(c) of Ministerial Council Decision 2015/09/MC-EnC.

routes;

(iv) sustainability, *inter alia* through reducing emissions, supporting intermittent renewable generation and enhancing deployment of renewable gas;

(c) for electricity smart grid projects falling under the energy infrastructure category set out in **Annex I.1(d)**, the project is to contribute significantly to all of the following specific criteria:

(i) integration and involvement of network users with new technical requirements with regard to their electricity supply and demand;

(ii) efficiency and interoperability of electricity transmission and distribution in day-to-day network operation;

(iii) network security, system control and quality of supply;

(iv) optimised planning of future cost-efficient network investments;

(v) market functioning and customer services;

(vi) involvement of users in the management of their energy usage;

(d) for oil transport projects falling under the energy infrastructure categories set out in **Annex I.3**, the project is to contribute significantly to all of the following specific criteria:

(i) security of supply reducing single supply source or route dependency;

(ii) efficient and sustainable use of resources through mitigation of environmental risks;

(iii) interoperability;

(e) <...><sup>2</sup>

3. For projects falling under the energy infrastructure categories set out in **Annex I.1** to 3, the criteria listed in this Article shall be assessed in accordance with the indicators set out in **Annex III.2** to 5.

4. In order to facilitate the assessing of all projects that could be eligible as projects of **Energy Community** interest and that could be included in a **preliminary** list, each Group shall assess each **project's benefits** in a transparent and objective manner. Each Group shall determine its assessment method on the basis of the aggregated contribution to the criteria referred to in paragraph 2; this assessment shall lead to a ranking of projects for internal use of the Group. Neither the **preliminary** list nor the **Energy Community** list shall contain any ranking, nor shall the ranking be used for any subsequent purpose except as described in **Annex II.2(12)**.

When assessing projects, each Group shall furthermore give due consideration to:

(a) the urgency of each proposed project in order to meet the Union energy policy targets of market integration and competition, sustainability and security of supply;

(b) the number of **Contracting Parties and Member States** affected by each project, whilst ensuring equal opportunities for projects involving peripheral **Contracting Parties and Member States**;

(c) the contribution of each project to territorial cohesion; and

(d) complementarity with regard to other proposed projects.

For smart grids projects falling under the energy infrastructure category set out in **Annex I.1(d)**, ranking shall be carried out for those projects that affect the same two **Contracting Parties**, and due consideration shall also be given to the number of users affected by the project, the annual energy consumption and the share of generation from non-dispatchable resources in the area covered

<sup>2</sup> Not applicable according to Article 8(2) of Ministerial Council Decision 2015/09/MC-EnC.

by these users.

5.<sup>3</sup> **When the project directly crosses the border of one or more Contracting Parties and one or more Member States, in order to be considered to be a project of Energy Community interest, it shall be first granted a status of project of the common interest within the European Union.**

6.<sup>4</sup> **Project that directly crosses the border of one or more Contracting Parties and one or more Member States which is not granted a status of project of the common interest within the European Union may be developed on voluntary basis as a project of Mutual Interest.**

### **Article 5**

#### **Implementation and monitoring**

1. Project promoters shall draw up an implementation plan for projects of **Energy Community** interest, including a timetable for each of the following:

- (a) feasibility and design studies;
- (b) approval by the national regulatory authority or by any other authority concerned;
- (c) construction and commissioning;
- (d) the permit granting schedule referred to in Article 10(4)(b).

2. TSOs, distribution system operators and other operators shall co-operate with each other in order to facilitate the development of projects of **Energy Community** interest in their area.

3. The **Energy Community Secretariat** and the Groups concerned shall monitor the progress achieved in implementing the projects of **Energy Community** interest and, if necessary, make recommendations to facilitate the implementation of projects of **Energy Community** interest. The Groups may request that additional information be provided in accordance with paragraphs 4, 5 and 6, convene meetings with the relevant parties and invite the **Energy Community Secretariat** to verify the information provided on site.

4. By 31 March of each year following the year of inclusion of a project of **Energy Community** interest on the **Energy Community** list pursuant to Article 3, project promoters shall submit an annual report, for each project falling under the categories set out in **Annex I.1** and 2, to the competent authority referred to in Article 8 and either to the **Regulatory Board** or, for projects falling under the categories set out in **Annex I.3**, to the respective Group. That report shall give details of:

- (a) the progress achieved in the development, construction and commissioning of the project, in particular with regard to permit granting and consultation procedures;
- (b) where relevant, delays compared to the implementation plan, the reasons for such delays and other difficulties encountered;
- (c) where relevant, a revised plan aiming at overcoming the delays.

5. Within three months of the receipt of the annual reports referred to in paragraph 4 of this Article, the **Energy Community Secretariat** shall submit to the Groups a consolidated report for the proj-

<sup>3</sup> The text displayed here corresponds to Article 8(4) of Ministerial Council Decision 2015/09/MC-EnC.

<sup>4</sup> *ibid.*

ects of **Energy Community** interest falling under the categories set out in **Annex I.1** and 2, evaluating the progress achieved and make, where appropriate, recommendations on how to overcome the delays and difficulties encountered. <...>

6. Each year, the competent authorities referred to in Article 8 shall report to the respective Group on the progress and, where relevant, on delays in the implementation of projects of **Energy Community** interest located on their respective territory with regard to the permit granting processes, and on the reasons for such delays.

7. If the commissioning of a project of **Energy Community** interest is delayed compared to the implementation plan, other than for overriding reasons beyond the control of the project promoter:

(a) **in so far as measures referred to in Article 22(7)(a), (b) or (c) of Directives 2009/72/EC and 2009/73/EC, as incorporated and adapted by the Ministerial Council Decision 2011/02/MC-EnC, are applicable according to respective national laws, national regulatory authorities shall ensure that the investment is carried out;**

(b) if the measures of national regulatory authorities according to point (a) are not applicable, the project promoter shall choose a third party to finance or construct all or part of the project. The project promoter shall do so before the delay compared to the date of commissioning in the implementation plan exceeds two years;

(c) if a third party is not chosen according to point (b), the **Contracting Party** or, when the **Contracting Party** has so provided, the national regulatory authority may, within two months of the expiry of the period referred to in point (b), designate a third party to finance or construct the project which the project promoter shall accept;

(d) <...><sup>5</sup>

(d) when **point (c)** is applied, the system operator in whose area the investment is located shall provide the implementing operators or investors or third party with all the information needed to realise the investment, shall connect new assets to the transmission network and shall generally make its best efforts to facilitate the implementation of the investment and the secure, reliable and efficient operation and maintenance of the project of **Energy Community** interest.

8. A project of **Energy Community** interest may be removed from the **Energy Community** list according to the procedure set out in Article 3(4) if its inclusion in that list was based on incorrect information which was a determining factor for that inclusion, or the project does not comply with **Energy Community** law.

9. Projects which are no longer on the **Energy Community** list shall lose all rights and obligations linked to the status of project of **Energy Community** interest arising from this Regulation.

However, a project which is no longer on the **Energy Community** list but for which an application file has been accepted for examination by the competent authority shall maintain the rights and obligations arising from Chapter III, except where the project is no longer on the list for the reasons set out in paragraph 8.

10. <...><sup>6</sup>

<sup>5</sup> Not applicable according to Article 9(3)(b) of Ministerial Council Decision 2015/09/MC-EnC.

<sup>6</sup> Not applicable according to Article 9(4) of Ministerial Council Decision 2015/09/MC-EnC.

## **Article 6**

### **PECI coordinators**

1. Where a project of **Energy Community** interest encounters significant implementation difficulties, the **Energy Community Secretariat may propose and Permanent High Level Group may designate in agreement with Contracting Parties and Member States** concerned, a **PECI** coordinator for a period of up to one year renewable twice.
2. The **PECI** coordinator shall:
  - (a) promote the projects, for which he has been designated **PECI** coordinator and the cross-border dialogue between the project promoters and all concerned stakeholders;
  - (b) assist all parties as necessary in consulting concerned stakeholders and obtaining necessary permits for the projects;
  - (c) if appropriate, advise project promoters on the financing of the project;
  - (d) ensure that appropriate support and strategic direction by the **Contracting Parties** concerned are provided for the preparation and implementation of the projects;
  - (e) submit every year, and if appropriate, upon completion of their mandate, a report to the **Energy Community Secretariat** on the progress of the projects and on any difficulties and obstacles which are likely to significantly delay the commissioning date of the projects. **The Secretariat shall transmit the report to the Permanent High Level Group and the Groups concerned. The Permanent High Level Group may bring the report also to the attention of the Ministerial Council.**
3. The **PECI** coordinator shall be chosen on the basis of his experience with regard to the specific tasks assigned to him for the projects concerned.
4. The decision designating the **PECI** coordinator shall specify the terms of reference, detailing the duration of the mandate, the specific tasks and corresponding deadlines, and the methodology to be followed. The coordination effort shall be proportionate to the complexity and estimated costs of the projects.
5. The **Contracting Parties** concerned shall fully cooperate with the **PECI** coordinator in his execution of the tasks referred to in paragraphs 2 and 4.

## **CHAPTER III**

### **PERMIT GRANTING AND PUBLIC PARTICIPATION**

## **Article 7**

### **'Priority status' of projects of Energy Community interest**

1. The adoption of the **Energy Community** list shall establish, for the purposes of any decisions issued in the permit granting process, the necessity of these projects from an energy policy perspective, without prejudice to the exact location, routing or technology of the project.
2. For the purpose of ensuring efficient administrative processing of the application files related to projects of **Energy Community** interest, project promoters and all authorities concerned shall en-

sure that the most rapid treatment legally possible is given to these files.

3. Where such status exists in national law, projects of **Energy Community** interest shall be allocated the status of the highest national significance possible and be treated as such in permit granting processes — and if national law so provides, in spatial planning — including those relating to environmental assessments, in the manner such treatment is provided for in national law applicable to the corresponding type of energy infrastructure.

4. <...><sup>7</sup>

**4. Contracting Parties** shall assess, taking due account of the guidance **issued by the Commission under Article 7(4) of the Regulation (EU) No 347/2013**, which measures to streamline the environmental assessment procedures and to ensure their coherent application are possible, and shall inform the **Energy Community Secretariat** of the result.

**5. By 4 years** from the date of issue of the guidance referred to in paragraph 4, **Contracting Parties** shall take the non-legislative measures that they have identified under **paragraph 4**.

**6. By 5 years** from the date of issue of the guidance referred to in paragraph 4, **Contracting Parties** shall take the legislative measures that they have identified under **paragraph 4**. These measures shall be without prejudice to obligations resulting from **Energy Community** law.

**7. With regard to the environmental impacts addressed in Article 6(4) of Directive 92/43/EEC and Article 4(7) of Directive 2000/60/EC, to the extent applicable to a Contracting Party under bilateral arrangements with the European Union**, projects of **Energy Community** interest shall be considered as being of public interest from an energy policy perspective, and may be considered as being of overriding public interest, provided that all the conditions set out in these Directives are fulfilled.

<...>

## **Article 8**

### **Organisation of the permit granting process**

1. By **30 June 2017**, each **Contracting Party** shall designate one national competent authority which shall be responsible for facilitating and coordinating the permit granting process for projects of **Energy Community** interest.

2. The responsibility of the competent authority referred to in paragraph 1 and/or the tasks related to it may be delegated to, or carried out by, another authority, per project of **Energy Community** interest or per particular category of projects of **Energy Community** interest, provided that:

(a) the competent authority notifies the **Energy Community Secretariat** of that delegation and the information therein is published by either the competent authority or the project promoter on the website referred to in Article 9(7);

(b) only one authority is responsible per project of **Energy Community** interest, is the sole point of contact for the project promoter in the process leading to the comprehensive decision for a given project of **Energy Community** interest, and coordinates the submission of all relevant documents and information.

<sup>7</sup> Not applicable according to Article 11(1) of Ministerial Council Decision 2015/09/MC-EnC.

The competent authority may retain the responsibility to establish time limits, without prejudice to the time limits set in accordance with Article 10.

3. Without prejudice to relevant requirements under international and **Energy Community** law, the competent authority shall take actions to facilitate the issuing of the comprehensive decision. The comprehensive decision shall be issued within the time limit referred to in Article 10(1) and (2) and according to one of the following schemes:

(a) integrated scheme: the comprehensive decision shall be issued by the competent authority and shall be the sole legally binding decision resulting from the statutory permit granting procedure. Where other authorities are concerned by the project, they may, in accordance with national law, give their opinion as input to the procedure, which shall be taken into account by the competent authority;

(b) coordinated scheme: the comprehensive decision comprises multiple individual legally binding decisions issued by several authorities concerned, which shall be coordinated by the competent authority. The competent authority may establish a working group where all concerned authorities are represented in order to draw up a permit granting schedule in accordance with Article 10(4)(b), and to monitor and coordinate its implementation. The competent authority shall, in consultation with the other authorities concerned, where applicable in accordance with national law, and without prejudice to time limits set in accordance with Article 10, establish on a case-by-case basis a reasonable time limit within which the individual decisions shall be issued. The competent authority may take an individual decision on behalf of another national authority concerned, if the decision by that authority is not delivered within the time limit and if the delay cannot be adequately justified; or, where provided under national law, and to the extent that this is compatible with **Energy Community** law, the competent authority may consider that another national authority concerned has either given its approval or refusal for the project if the decision by that authority is not delivered within the time limit. Where provided under national law, the competent authority may disregard an individual decision of another national authority concerned if it considers that the decision is not sufficiently substantiated with regard to the underlying evidence presented by the national authority concerned; when doing so, the competent authority shall ensure that the relevant requirements under international and **Energy Community** law are respected and shall duly justify its decision;

(c) collaborative scheme: the comprehensive decision shall be coordinated by the competent authority. The competent authority shall, in consultation with the other authorities concerned, where applicable in accordance with national law, and without prejudice to time limits set in accordance with Article 10, establish on a case-by-case basis a reasonable time limit within which the individual decisions shall be issued. It shall monitor compliance with the time limits by the authorities concerned.

If an individual decision by an authority concerned is not expected to be delivered within the time limit, that authority shall inform the competent authority without delay and include a justification for the delay. Subsequently, the competent authority shall reset the time limit within which that individual decision shall be issued, whilst still complying with the overall time limits set in accordance with Article 10.

Acknowledging the national specificities in planning and permit granting processes, **Contracting Parties** may choose among the three schemes referred to in points (a), (b) and (c) of the first subparagraph to facilitate and coordinate their procedures and shall opt to implement the most effective scheme. Where a **Contracting Party** chooses the collaborative scheme, it shall inform the **Energy**

**Community Secretariat** of its reasons therefor. The **Energy Community Secretariat** shall undertake an evaluation of the effectiveness of the schemes in the report referred to in Article 17.

4. **Contracting Party** may apply different schemes as set out in paragraph 3 to onshore and off-shore projects of **Energy Community** interest.

5. If a project of **Energy Community** interest requires decisions to be taken in two or more **Contracting Parties**, the respective competent authorities shall take all necessary steps for efficient and effective cooperation and coordination among themselves, including as regards the provisions referred to in Article 10(4). **Contracting Parties** shall endeavour to provide for joint procedures, particularly with regard to the assessment of environmental impacts.

**6.<sup>8</sup> If a project of Energy Community interest requires decisions to be taken in one or more Contracting Parties and one or more Member States, the respective competent authorities are encouraged to take all necessary steps for efficient and effective cooperation and coordination among themselves, including as regards the provisions referred to in Article 10(4). Contracting Parties and Member States concerned are encouraged to provide for joint procedures, particularly with regard to the assessment of environmental impacts.**

## *Article 9*

### **Transparency and public participation**

1. By **31 December 2017**, the **Contracting Party** or competent authority shall, where applicable in collaboration with other authorities concerned, publish a manual of procedures for the permit granting process applicable to projects of **Energy Community** interest. The manual shall be updated as necessary and made available to the public. The manual shall at least include the information specified in **Annex V.1**. The manual shall not be legally binding, but it may refer to or quote relevant legal provisions.

2. Without prejudice to any requirements under the Aarhus and Espoo Conventions and relevant **Energy Community** law, all parties involved in the permit granting process shall follow the principles for public participation set out in of **Annex V.3**.

3. The project promoter shall, within an indicative period of three months of the start of the permit granting process pursuant to Article 10(1)(a), draw up and submit a concept for public participation to the competent authority, following the process outlined in the manual referred to in paragraph 1 and in line with the guidelines set out in **Annex V**. The competent authority shall request modifications or approve the concept for public participation within three months; in so doing, the competent authority shall take into consideration any form of public participation and consultation that took place before the start of the permit granting process, to the extent that such public participation and consultation has fulfilled the requirements of this Article.

Where the project promoter intends to make significant changes to an approved concept, it shall inform the competent authority thereof. In that case the competent authority may request modifications.

4. At least one public consultation shall be carried out by the project promoter, or, where required by national law, by the competent authority, before submission of the final and complete applica-

<sup>8</sup> The text displayed here corresponds to Article 12(2) of Ministerial Council Decision 2015/09/MC-EnC.

tion file to the competent authority pursuant to Article 10(1)(a). This shall be without prejudice to any public consultation to be carried out after submission of the request for development consent according to Article 6(2) of Directive 2011/92/EU. The public consultation shall inform stakeholders referred to in **Annex V.3(a)** about the project at an early stage and shall help to identify the most suitable location or trajectory and the relevant issues to be addressed in the application file. The minimum requirements applicable to this public consultation are specified in **Annex V.5**.

The project promoter shall prepare a report summarising the results of activities related to the participation of the public prior to the submission of the application file, including those activities that took place before the start of the permit granting process. The project promoter shall submit that report together with the application file to the competent authority. Due account shall be taken of these results in the comprehensive decision.

5. For projects crossing the border of two or more **Contracting Parties**, the public consultations pursuant to paragraph 4 in each of the **Contracting Parties** concerned shall take place within a period of no more than two months from the date on which the first public consultation started.

**For projects crossing the border of two or more Contracting Parties, or one or more Contracting Parties and one or more Member States, the public consultations pursuant to paragraph 4 in each of the Contracting Parties and the Member States concerned may take place within a period of no more than two months from the date on which the first public consultation started.**<sup>9</sup>

6. For projects likely to have significant adverse cross-border impacts in one or more neighbouring **Contracting Parties or Member States**, where Article 7 of Directive 2011/92/EU and the Espoo Convention are applicable, the relevant information shall be made available to the competent authority of the neighbouring **Contracting Parties or Member States**. The competent authority of the neighbouring **Contracting Parties or Member States** shall indicate, in the notification process where appropriate, whether it, or any other authority concerned, wishes to participate in the relevant public consultation procedures.

7. The project promoter, or, where national law so provides, the competent authority, shall establish and regularly update a website with relevant information about the project of **Energy Community** interest, which shall be linked to the **Energy Community** website and which shall meet the requirements specified in **Annex V.6**. Commercially sensitive information shall be kept confidential.

Project promoters shall also publish relevant information by other appropriate information means to which the public has open access.

<sup>9</sup> The text displayed here corresponds to Article 13(2) of Ministerial Council Decision 2015/09/MC-EnC.

## **Article 10**

### **Duration and implementation of the permit granting process**

1. The permit granting process shall consist of two procedures:

(a) The pre-application procedure, covering the period between the start of the permit granting process and the acceptance of the submitted application file by the competent authority, shall take place within an indicative period of two years.

This procedure shall include the preparation of any environmental reports to be prepared by the project promoters.

For the purpose of establishing the start of the permit granting process, the project promoters shall notify the project to the competent authority of the **Contracting Parties** concerned in written form, and shall include a reasonably detailed outline of the project. No later than three months following the receipt of the notification, the competent authority shall, including on behalf of other authorities concerned, acknowledge or, if it considers the project as not mature enough to enter the permit granting process, reject the notification in written form. In the event of a rejection, the competent authority shall justify its decision, including on behalf of other authorities concerned. The date of signature of the acknowledgement of the notification by the competent authority shall serve as the start of the permit granting process. Where **two or more Contracting Parties, and/or Member States are concerned**, the date of the acceptance of the last notification by the competent authority concerned shall serve as the date of the start of the permit granting process.

(b) The statutory permit granting procedure, covering the period from the date of acceptance of the submitted application file until the comprehensive decision is taken, shall not exceed one year and six months. **Contracting Parties** may set an earlier date for the time-limit, if considered appropriate.

2. The combined duration of the two procedures referred to in paragraph 1 shall not exceed a period of three years and six months. However, where the competent authority considers that one or both of the two procedures of the permit granting process will not be completed before the time limits as set out in paragraph 1, it may decide, before their expiry and on a case by case basis, to extend one or both of those time limits by a maximum of nine months for both procedures combined.

In that case, the competent authority shall inform the Group concerned and present to the Group concerned the measures taken or to be taken to conclude the permit granting process with the least possible delay. The Group may request the competent authority to report regularly on progress achieved in this regard.

3. In **Contracting Parties** where the determination of a route or location undertaken solely for the specific purpose of a planned project, <...> cannot be included in the process leading to the comprehensive decision, the corresponding decision shall be taken within a separate period of six months, starting on the date of submission of the final and complete application documents by the promoter.

In that case, the extension period referred to in paragraph 2 shall be reduced to six months, including for the procedure referred to in this paragraph.

4. The pre-application procedure shall comprise the following steps:

(a) upon the acknowledgement of the notification pursuant to paragraph 1(a), the competent authority shall identify, in close cooperation with the other authorities concerned, and where appropriate on the basis of a proposal by the project promoter, the scope of material and level of detail of informa-

tion to be submitted by the project promoter, as part of the application file, to apply for the comprehensive decision. The checklist referred to in **Annex V.1(e)** shall serve as a basis for this identification;

(b) the competent authority shall draw up, in close cooperation with the project promoter and other authorities concerned and taking into account the results of the activities carried out under point (a), a detailed schedule for the permit granting process in line with the guidelines set out in **Annex V.(2)**;

For projects crossing the border between two or more **Contracting Parties**, the competent authorities of the **Contracting Parties** concerned shall prepare a joint schedule, in which they endeavour to align their timetables;

**For projects crossing the border between one or more Contracting Parties and one or more Member States, the competent authorities of the Contracting Parties and Member States concerned are encouraged to prepare a joint schedule, in which they endeavour to align their timetables;**<sup>10</sup>

(c) upon receipt of the draft application file, the competent authority shall, if necessary, and including on behalf of other authorities concerned, make further requests regarding missing information to be submitted by the project promoter, which may only address subjects identified under point (a). Within three months of the submission of the missing information, the competent authority shall accept for examination the application in written form. Requests for additional information may only be made if they are justified by new circumstances.

5. The project promoter shall ensure the completeness and adequate quality of the application file and seek the competent authority's opinion on this as early as possible during the pre-application procedure. The project promoter shall cooperate fully with the competent authority to meet deadlines and comply with the detailed schedule as defined in paragraph 4(b).

6. The time limits laid down in this Article shall be without prejudice to obligations arising from international and **Energy Community** law, and without prejudice to administrative appeal procedures and judicial remedies before a court or tribunal.

## CHAPTER IV REGULATORY TREATMENT

### *Article 11*

#### Energy system wide cost-benefit analysis

1. **The methodologies published by the European Network of Transmission System Operators (ENTSO) for Electricity and the ENTSO for Gas respectively under Article 11 of Regulation (EU) No 347/2013 shall be applied for projects falling under the categories set out in Annex I.(1) and (2).**

2. <...>

3. <...>

4. <...>

<sup>10</sup> The text displayed here corresponds to Article 14(3) of Ministerial Council Decision 2015/09/MC-EnC.

5. <...>

6. <...><sup>11</sup>

2. By **30 June 2018**, national regulatory authorities cooperating in the framework of the **Regulatory Board** shall establish and make publicly available a set of indicators and corresponding reference values for the comparison of unit investment costs for comparable projects of the infrastructure categories included in **Annex I.1** and 2. **Those reference values may be used by the project promoters for the cost-benefit analyses carried out for their projects.**

**A set of indicators and corresponding reference values for the comparison of unit investment costs, referred to in first subparagraph shall be consistent with those established under Article 11 (7) of Regulation (EU) No 347/2013. The Agency is invited to include in a set of indicators and corresponding reference values, established under that Article, unit investment costs submitted by national regulatory authorities from Contracting Parties.**<sup>12</sup>

3. **The Secretariat shall prepare and submit for endorsement to the Permanent High Level Group an electricity and gas market and network model including both electricity transmission infrastructure, and gas transmission infrastructure as well as storage and LNG facilities, covering the energy infrastructure in the Energy Community, and drawn up in line with the principles laid down in Annex IV. These models shall be in line with those proposed by ENTSO E and ENTSO G under Article 11(8) of Regulation (EU) No 347/2013.**

## *Article 12*

### **Enabling investments with cross-border impacts**

1. **The efficiently incurred investment costs, which excludes maintenance costs, related to a project of Energy Community interest falling under the categories set out in Annex I.(1) and Annex I.(2), and concerning only Contracting Parties, shall be borne by the relevant TSO or the project promoters of the transmission infrastructure of the Contracting Parties to which the project provides a net positive impact, and, to the extent not covered by congestion rents or other charges, be paid for by network users through tariffs for network access in that or those Contracting Parties.**

**The efficiently incurred investment costs, which excludes maintenance costs, related to a project of Energy Community interest falling under the categories set out in Annex I.(1) and Annex I.(2), and concerning Member States and Contracting Parties, may be borne by the relevant TSO or the project promoters of the transmission infrastructure of the Contracting Parties and Member States, to which the project provides a net positive impact, and, to the extent not covered by congestion rents or other charges, be paid for by network users through tariffs for network access in that or those Contracting Parties and Member States concerned.**<sup>13</sup>

2. For a project of **Energy Community** interest falling under the categories set out in **Annex I.1(a), and (c)** and **Annex I.2**, paragraph 1 shall apply only if at least one project promoter requests the rel-

<sup>11</sup> Paragraphs 2, 3, 4, 5 and 6 are not applicable according to Article 15(2) of Ministerial Council Decision 2015/09/MC-EnC.

<sup>12</sup> The text displayed here corresponds to Article 15(3)(c) of Ministerial Council Decision 2015/09/MC-EnC.

<sup>13</sup> The text displayed here corresponds to Article 16(1)(b) of Ministerial Council Decision 2015/09/MC-EnC.

evant national authorities to apply this Article for all or parts of the costs of the project. For a project of **Energy Community** interest falling under the categories set out in **Annex I.2**, paragraph 1 shall apply only where an assessment of market demand has already been carried out and indicated that the efficiently incurred investment costs cannot be expected to be covered by the tariffs.

Where a project has several project promoters, the relevant national regulatory authorities shall without delay request all project promoters to submit the investment request jointly in accordance with paragraph 3.

3. For a project of **Energy Community** interest to which paragraph 1 applies, the project promoters shall keep all concerned national regulatory authorities regularly informed, at least once per year, and until the project is commissioned, of the progress of that project and the identification of costs and impacts associated with it.

As soon as such a project has reached sufficient maturity, the project promoters, after having consulted the TSOs **from the Contracting Parties and Member States concerned** to which the project provides a significant net positive impact, shall submit an investment request. That investment request shall include a request for a cross-border cost allocation and shall be submitted to all the national regulatory authorities concerned, accompanied by the following:

(a) a project-specific cost-benefit analysis consistent with the methodology drawn up pursuant to Article 11 and taking into account benefits beyond the borders of the **Contracting Party and Member State concerned**;

(b) a business plan evaluating the financial viability of the project, including the chosen financing solution, and, for a project of **Energy Community** interest falling under the category referred to in **Annex I.2**, the results of market testing; and

(c) if the project promoters agree, a substantiated proposal for a cross-border cost allocation.

If a project is promoted by several project promoters, they shall submit their investment request jointly.

**For projects included in the Energy Community list approved by the Ministerial Council in 2013, project promoters shall submit their investment request by 30 September 2016. A copy of each investment request shall be transmitted for information without delay by the national regulatory authorities to the Regulatory Board on receipt.**

The national regulatory authorities and the **Regulatory Board** shall preserve the confidentiality of commercially sensitive information.

4. Within six months of the date on which the last investment request was received by the national regulatory authorities concerned, the national regulatory authorities shall, after consulting the project promoters concerned, take coordinated decisions on the allocation of investment costs to be borne by each system operator for the project, as well as their inclusion in tariffs. The national regulatory authorities may decide to allocate only part of the costs, or may decide to allocate costs among a package of several projects of **Energy Community** interest.

When allocating the costs, the national regulatory authorities shall take into account actual or estimated:

— congestion rents or other charges,

— **revenues stemming from the inter-transmission system operator compensation mechanism established under Article 13 of Regulation (EC) No 714/2009, as incorporated and**

**adapted by the Ministerial Council Decision 2011/02/MC-EnC and by Decision 2013/01/PHLG.**

In deciding to allocate costs across borders, the economic, social and environmental costs and benefits of the projects **in the Contracting Parties and Member States concerned** and the possible need for financial support shall be taken into account.

In deciding to allocate costs across borders, the relevant national regulatory authorities, in consultation with the TSOs concerned, shall seek a mutual agreement based on, but not limited to, the information specified in paragraph 3(a) and (b).

If a project of **Energy Community** interest mitigates negative externalities, such as loop flows, and that project of **Energy Community** interest is implemented in the **Contracting Party or the Member State** at the origin of the negative externality, such mitigation shall not be regarded as a cross-border benefit and shall therefore not constitute a basis for allocating costs to **the TSO of the Contracting Parties and Member States affected** by those negative externalities.

**5. National regulatory authorities shall, based on the cross-border cost allocation as referred to in paragraph 4 of this Article, take into account actual costs incurred by a TSO or other project promoter as a result of the investments when fixing or approving tariffs in accordance with Article 37(1)(a) of Directive 2009/72/EC and Article 41(1)(a) of Directive 2009/73/EC as incorporated and adapted by Ministerial Council Decision 2011/02/MC-EnC, insofar as these costs correspond to those of an efficient and structurally comparable operator.**

The cost allocation decision shall be notified, without delay, by the national regulatory authorities **to the Regulatory Board and the Agency**, together with all the relevant information with respect to the decision. In particular, the information shall contain detailed reasons on the basis of which costs were allocated **among Contracting Parties, and Member States concerned**, such as the following:

- (a) an evaluation of the identified impacts, including concerning network tariffs, on each of **the concerned Contracting Parties and Member States;**
- (b) an evaluation of the business plan referred to in paragraph 3(b);
- (c) regional or Union-wide positive externalities, which the project would generate;
- (d) the result of the consultation of the project promoters concerned.

The cost allocation decision shall be published.

**6. Where the national regulatory authorities concerned have not reached an agreement on the investment request within six months of the date on which the request was received by the last of the national regulatory authorities concerned, they shall inform the Regulatory Board, the Energy Community Secretariat and the Commission without delay.**

In this case or upon a joint request from the national regulatory authorities concerned, the decision on the investment request including cross-border cost allocation referred to in paragraph 3 as well as the way the cost of the investments are reflected in the tariffs shall be taken by the **Regulatory Board** within three months of the date of referral to the **Regulatory Board**.

Before taking such a decision, the **Regulatory Board shall consult the Energy Community Secretariat, the national regulatory authorities concerned** and the project promoters. The three-month period referred to in the second subparagraph may be extended by an additional period of

two months where further information is sought by the **Regulatory Board**. That additional period shall begin on the day following receipt of the complete information.

The cost allocation decision shall be published. **Procedure referred to in this paragraph shall be applicable to projects having cross-border impacts only between Contracting Parties. Issues concerning allocation of costs across borders between Member States and Contracting Parties shall be deemed to be solved only by means of mutual agreement.**

7. A copy of all cost allocation decisions, together with all the relevant information with respect to each decision, shall be notified, without delay, by the **Regulatory Board** to the **Energy Community Secretariat**. That information may be submitted in aggregate form. The **Energy Community Secretariat** shall preserve the confidentiality of commercially sensitive information.

8. **This cost allocation decision shall not affect the right of TSOs to apply and national regulatory authorities to approve charges for access to networks in accordance with Article 32 of Directive 2009/72/EC and of Directive 2009/73/EC, Article 14 of Regulation (EC) No 714/2009, and Article 13 of Regulation (EC) No 715/2009, as incorporated and adapted by Ministerial Council Decision 2011/02/MC-EnC.**

9. This Article shall not apply to projects of **Energy Community** interest having received:

(a) **an exemption from Articles 32, 33, 34 and Article 41(6), (8) and (10) of Directive 2009/73/EC pursuant to Article 36 of Directive 2009/73/EC, as incorporated and adapted by Ministerial Council Decision 2011/02/MC-EnC;**

(b) **an exemption from Article 16(6) of Regulation (EC) No 714/2009 or an exemption from Article 32 and Article 37(6) and (10) of Directive 2009/72/EC pursuant to Article 17 of Regulation (EC) No 714/2009, as incorporated and adapted by Ministerial Council Decision 2011/02/MC-EnC;**

(c) an exemption under Article 22 of Directive 2003/55/EC; or

(d) an exemption under Article 7 of Regulation (EC) No 1228/2003.

### **Article 13**

#### **Incentives**

1. Where a project promoter incurs higher risks for the development, construction, operation or maintenance of a project of **Energy Community** interest falling under the categories set out in **Annex I.1(a), and (c) and Annex I.2**, compared to the risks normally incurred by a comparable infrastructure project, **Contracting Parties** and national regulatory authorities shall ensure that appropriate incentives are granted to that project in accordance with Article 37(8) of Directive 2009/72/EC, Article 41(8) of Directive 2009/73/EC, Article 14 of Regulation (EC) No 714/2009, and Article 13 of Regulation (EC) No 715/2009, **as incorporated and adapted by Ministerial Council Decision 2011/02/MC-EnC.**

The first subparagraph shall not apply where the project of **Energy Community** interest has received:

(a) an exemption from Articles 32, 33, 34 and Article 41(6), (8) and (10) of Directive 2009/73/EC pursuant to Article 36 of Directive 2009/73/EC, **as incorporated and adapted by Ministerial Council**

**Decision 2011/02/MC-EnC;**

(b) an exemption from Article 16(6) of Regulation (EC) No 714/2009 or an exemption from Article 32 and Article 37(6) and (10) of Directive 2009/72/EC pursuant to Article 17 of Regulation (EC) No 714/2009, **as incorporated and adapted by Ministerial Council Decision 2011/02/MC-EnC;**

(c) an exemption under Article 22 of Directive 2003/55/EC; or

(d) an exemption under Article 7 of Regulation (EC) No 1228/2003.

2. The decision of the national regulatory authorities for granting the incentives referred to in paragraph 1 shall consider the results of the cost-benefit analysis on the basis of the methodology drawn up pursuant to Article 11 and in particular the regional or **Energy Community**-wide positive externalities generated by the project. The national regulatory authorities shall further analyse the specific risks incurred by the project promoters, the risk mitigation measures taken and the justification of this risk profile in view of the net positive impact provided by the project, when compared to a lower-risk alternative. Eligible risks shall notably include risks related to new transmission technologies, both onshore and offshore, risks related to under-recovery of costs and development risks.

3. The incentive granted by the decision shall take account of the specific nature of the risk incurred and may cover *inter alia*:

(a) the rules for anticipatory investment; or

(b) the rules for recognition of efficiently incurred costs before commissioning of the project; or

(c) the rules for providing additional return on the capital invested for the project; or

(d) the any other measure deemed necessary and appropriate.

4. By **30 June 2017**, each national regulatory authority shall submit to the **Regulatory Board** its methodology and the criteria used to evaluate investments in electricity and gas infrastructure projects and the higher risks incurred by them, where available.

5. **Good practices and recommendations referred to in Article 13 of the Regulation (EU) 347/2013 shall be applied accordingly.**

6. By **31 December 2017**, each national regulatory authority shall publish its methodology and the criteria used to evaluate investments in electricity and gas infrastructure projects and the higher risks incurred by them.

7. **Where the measures referred to in paragraphs 5 and 6 are not sufficient to ensure the timely implementation of projects of Energy Community interest, the Commission guidelines referred to in Article 13 paragraph 7 of the Regulation (EU) 347/2013 shall be applied accordingly.**

## CHAPTER V FINANCING

### Article 14

#### Eligibility of projects for Union **technical and financial assistance**

1. **Projects of Energy Community interest falling under the categories set out in Annex I.(1), (2) are eligible for Union technical and financial assistance in the form of grants for studies and financial instruments from the Instrument for Pre-Accession Assistance (IPA) and the Neighbourhood Investment Facility.**

2. **Projects of Energy Community interest falling under the categories set out in Annex I.(1) and (2), except for hydro-pumped electricity storage projects, are also eligible for financial assistance in the form of grants for works from the Instrument for Pre-Accession Assistance (IPA) and the Neighbourhood Investment Facility if they fulfil all of the following criteria:**

(a) the project specific cost-benefit analysis pursuant to Article 12(3)(a) provides evidence concerning the existence of significant positive externalities, such as security of supply, solidarity or innovation;

(b) the project has received a cross-border cost allocation decision pursuant to Article 12; or, for projects of **Energy Community** interest falling under the category set out in **Annex I.1(b)** and that therefore do not receive a cross-border cost allocation decision, the project shall aim to provide services across borders, bring technological innovation and ensure the safety of cross-border grid operation;

(c) the project is commercially not viable according to the business plan and other assessments carried out, notably by possible investors or creditors or the national regulatory authority. The decision on incentives and its justification referred to in Article 13(2) shall be taken into account when assessing the project's commercial viability.

3. Projects of **Energy Community** interest carried out in accordance with the procedure referred to in Article 5(7)(d) shall also be eligible for Union financial assistance in the form of grants for works if they fulfil the criteria set out in paragraph 2 of this Article.

4.<...><sup>14</sup>

### Article 15

#### Guidance for the award criteria of Union **technical and financial assistance**

**The specific criteria set out in Article 4(2) and the parameters set out in Article 4(4) shall also fulfil the role of objectives for the purpose of establishing award criteria for Union technical and financial assistance from the Instrument for Pre-Accession Assistance (IPA) and the Neighbourhood Investment Facility.**

<sup>14</sup> Not applicable according to Article 18(3) of Ministerial Council Decision 2015/09/MC-EnC.

**Article 16****Exercise of the delegation**<...><sup>15</sup>**CHAPTER VI  
FINAL PROVISIONS****Article 17****Reporting and evaluation**

Not later than **2018**, the **Energy Community Secretariat** shall publish a report on the implementation of projects of **Energy Community** interest and submit it to the **Ministerial Council**. This report shall provide an evaluation of:

- (a) the progress achieved for the planning, development, construction and commissioning of projects of **Energy Community** interest selected pursuant to Article 3, and, where relevant, delays in implementation and other difficulties encountered;
- (b) the funds engaged and disbursed by the Union for projects of **Energy Community** interest, compared to the total value of funded projects of **Energy Community** interest;
- (c) for the electricity and gas sectors, the evolution of the interconnection level **between Contracting Parties, and with Member States concerned**, the corresponding evolution of energy prices, as well as the number of network system failure events, their causes and related economic cost;
- (d) permit granting and public participation, in particular:
  - (i) the average and maximum total duration of permit granting processes for projects of **Energy Community** interest, including the duration of each step of the pre-application procedure, compared to the timing foreseen by the initial major milestones referred to in Article 10(4);
  - (ii) the level of opposition faced by projects of **Energy Community** interest (notably number of written objections during the public consultation process, number of legal recourse actions);
  - (iii) an overview of best and innovative practices with regard to stakeholder involvement and mitigation of environmental impact during permit granting processes and project implementation;
  - (iv) the effectiveness of the schemes foreseen in Article 8(3) regarding compliance with the time limits set under Article 10;
- (e) regulatory treatment, in particular:
  - (i) the number of projects of **Energy Community** interest having been granted a cross-border cost allocation decision pursuant to Article 12;
  - (ii) the number and type of projects of **Energy Community** interest having received specific incentives pursuant to Article 13;
- (f) **the effectiveness of this Regulation in contributing to the goals for market integration by 2016 and 2017, to the Treaty objectives and Contracting Parties' targets for renewable**

<sup>15</sup> Not applicable according to Article 20 of Ministerial Council Decision 2015/09/MC-EnC.

**energy and energy efficiency, as stipulated in Energy Community law and endorsed in the Energy Strategy.**

### **Article 18**

#### **Information and publicity**

The **Energy Community Secretariat** shall establish by six months **after the date of adoption of the first Energy Community list** an infrastructure transparency platform easily accessible to the general public, including via the internet. This platform shall contain the following information:

- (a) general, updated information, including geographic information, for each project of **Energy Community** interest;
- (b) the implementation plan as set out in Article 5(1) for each project of **Energy Community** interest;
- (c) the main results of the cost-benefit analysis on the basis of the methodology drawn up pursuant Article 11 for the projects of **Energy Community** interest concerned, except for any commercially sensitive information;
- (d) the **Energy Community** list;
- (e) the funds allocated and disbursed by the Union for each project of **Energy Community** interest.

### **Article 19**

#### **Transitional provisions**

1. For projects of Energy Community interest in the permit granting process for which a project promoter has submitted an application file before 16 October 2016, the provisions of Chapter III shall not apply.
2. As regards the next Energy Community list following the one adopted by the Ministerial Council on 24 October 2013, articles of this Regulation which do not require the Contracting Parties to implement domestic transposition measures, may be applied from the day of the adoption of this Regulation by the Ministerial Council.

### **Article 20**

#### **Amendments to Regulation (EC) No 713/2009**

<...>

### **Article 21**

#### **Amendments to Regulation (EC) No 714/2009**

<...>

### **Article 22**

#### **Amendments to Regulation (EC) No 715/2009**

<...>

### **Article 23**

#### **Repeal**

<...><sup>16</sup>

### **Article 24**

#### **Entry into force**

This Regulation shall enter into force upon adoption by the Ministerial Council. This Regulation shall be implemented by the Contracting Parties within the deadlines specified in the adapted Regulation. Domestic transposition measures shall be notified to the Secretariat within these deadlines.

#### **Implementation of the energy acquis**

1. Each Contracting Party shall bring into force the laws, regulations and administrative provisions necessary to comply with Regulation (EU) No 347/2013, as adapted by this Decision, by 31 December 2016. They shall forthwith inform the Energy Community Secretariat thereof.

The Contracting Parties shall apply those measures from 1 January 2017.

2. The Contracting Parties shall communicate to the Energy Community Secretariat the text of the main provisions of national law which they adopt in the field covered by this Decision.<sup>17</sup>

#### **Reporting**

1. The Secretariat shall monitor and review the application of this Decision in the Contracting Parties.

2. The Secretariat shall present a report to the Ministerial Council for the first time by 30 November 2016, and thereafter on an annual basis, summarising the opinions issued by the Secretariat in application of the acts referred to in Article 1, as adapted by this Decision.<sup>18</sup>

---

<sup>16</sup> Articles 20, 21, 22, and 23 are not applicable according to Article 24 of Ministerial Council Decision 2015/09/MC-EnC.

<sup>17</sup> The text displayed here corresponds to Article 3 of Decision 2015/09/MC-EnC.

<sup>18</sup> The text displayed here corresponds to Article 28 of Decision 2015/09/MC-EnC.

## ANNEX I

## ENERGY INFRASTRUCTURE CATEGORIES AND AREA

The energy infrastructure categories to be developed are the following:

(1) concerning electricity:

(a) high-voltage overhead transmission lines, if they have been designed for a voltage of 220 kV or more, and underground and submarine transmission cables, if they have been designed for a voltage of 150 kV or more;

(b) <...><sup>19</sup>

(b) electricity storage facilities used for storing electricity on a permanent or temporary basis in above-ground or underground infrastructure or geological sites, provided they are directly connected to high-voltage transmission lines designed for a voltage of 110 kV or more;

(c) any equipment or installation essential for the systems defined in (a) **and** (b) to operate safely, securely and efficiently, including protection, monitoring and control systems at all voltage levels and substations;

(d) any equipment or installation, both at transmission and medium voltage distribution level, aiming at two-way digital communication, real-time or close to real-time, interactive and intelligent monitoring and management of electricity generation, transmission, distribution and consumption within an electricity network in view of developing a network efficiently integrating the behaviour and actions of all users connected to it — generators, consumers and those that do both — in order to ensure an economically efficient, sustainable electricity system with low losses and high quality and security of supply and safety;

(2) concerning gas:

(a) transmission pipelines for the transport of natural gas and bio gas that form part of a network which mainly contains high-pressure pipelines, excluding high-pressure pipelines used for upstream or local distribution of natural gas;

(b) underground storage facilities connected to the above-mentioned high-pressure gas pipelines;

(c) reception, storage and regasification or decompression facilities for liquefied natural gas (LNG) or compressed natural gas (CNG);

(d) any equipment or installation essential for the system to operate safely, securely and efficiently or to enable bi-directional capacity, including compressor stations;

(3) concerning oil:

(a) pipelines used to transport crude oil;

(b) pumping stations and storage facilities necessary for the operation of crude oil pipelines;

(c) any equipment or installation essential for the system in question to operate properly, securely and efficiently, including protection, monitoring and control systems and reverse-flow devices;

(4) <...><sup>20</sup>

<sup>19</sup> Not applicable according to Article 26(2)(a)(ii) of Ministerial Council Decision 2015/09/MC-EnC.

<sup>20</sup> *ibid.*

**The priority thematic area to be developed:**

**Smart grids deployment: adoption of smart grid technologies across the Energy Community to efficiently integrate the behaviour and actions of all users connected to the electricity network, in particular the generation of large amounts of electricity from renewable or distributed energy sources and demand response by consumers.<sup>21</sup>**

---

<sup>21</sup> The text displayed here corresponds to Article 26(2)(a)(iii) of Ministerial Council Decision 2015/09/MC-EnC.

## ANNEX II

### PRELIMINARY LISTS OF PROJECTS OF ENERGY COMMUNITY INTEREST

#### 1. RULES FOR GROUPS

(1) For electricity projects falling under the categories set out in Annex I.(1) (a), (b) and (c), the Group includes representatives of the Contracting Parties and Member States concerned, the Commission, national regulatory authorities, TSOs, as well as the Energy Community Secretariat, and upon invitation the ENTSO for Electricity. For gas projects falling under the categories set out in Annex I.(2) (a), (b) and (c), the Group includes representatives of the Contracting Parties and Member States concerned, the Commission, national regulatory authorities, TSOs, as well as the Energy Community Secretariat, and upon the invitation the ENTSO for Gas. For oil transport projects falling under the categories set out in Annex I.(3) (a), (b) and (c), the same Group shall be used as for gas projects, and in addition it will include, project promoters concerned.

(2) The decision-making bodies of the Groups may merge. All Groups or decision-making bodies shall meet together, when relevant, to discuss matters common to all Groups; such matters may include issues relevant to cross-regional consistency or the number of proposed projects included on the draft **preliminary** lists at risk of becoming unmanageable.

(3) Each Group shall organise its work in line with regional cooperation efforts pursuant Article 6 of Directive 2009/72/EC, Article 7 of Directive 2009/73/EC, Article 12 of Regulation (EC) No 714/2009, and Article 12 of Regulation (EC) No 715/2009, **as incorporated and adapted by Ministerial Council Decision 2011/02/MC-EnC**, and other existing regional cooperation structures.

(4) Each Group shall invite, promoters of a project potentially eligible for selection as a project of **Energy Community** interest as well as representatives of national administrations, of regulatory authorities, and TSOs from <...> the member countries of the European Economic Area and the European Free Trade Association, representatives from the Energy Community institutions and bodies, countries covered by the European Neighbourhood policy and countries, with which the Union has established specific energy cooperation **as well as European Union institutions**. The decision to invite third country-representatives shall be based on consensus.

(5) Each Group shall consult the organisations representing relevant stakeholders — and, if deemed appropriate, stakeholders directly — including producers, distribution system operators, suppliers, consumers, and organisations for environmental protection. The Group may organise hearings or consultations, where relevant for the accomplishments of its tasks.

(6) The internal rules, an updated list of member organisations, regularly updated information on the progress of work, meeting agendas, as well as final conclusions and decisions of each Group shall be published by the **Energy Community Secretariat** on the transparency platform referred to in Article 18.

(7) The **Energy Community Secretariat** shall strive for consistency between the different Groups.

<...>

## 2. PROCESS FOR ESTABLISHING PRELIMINARY LISTS

(1) Promoters of a project potentially eligible for selection as a project of **Energy Community** interest wanting to obtain the status of projects of **Energy Community** interest shall submit an application for selection as project of **Energy Community** interest to the Group that includes:

— an assessment of their projects with regard to the contribution to **implementing the objectives of the Energy Community, as set in the Treaty, Energy Community law and the Energy Strategy of the Energy Community,**

— an analysis of the fulfilment of the relevant criteria defined in Article 4,

— for projects having reached a sufficient degree of maturity, a project-specific cost-benefit analysis <...> based on the methodologies developed by the ENTSO for electricity or the ENTSO for gas pursuant to Article 11, and

— any other relevant information for the evaluation of the project.

(2) All recipients shall preserve the confidentiality of commercially sensitive information.

(3) After adoption of the first **Energy Community** list, for all subsequent **Energy Community** lists adopted, proposed electricity transmission and storage projects falling under the categories set out in **Annex I.1(a), and (c)** shall be part of the latest available 10-year network development plan for electricity, developed by the ENTSO for Electricity pursuant Article 8 of Regulation (EC) No 714/2009, **with the exception of those located in a Contracting Party the TSO of which is not a member of ENTSO E. For those, the relevant projects shall be part of national ten year network development plans.**

(4) After adoption of the first **Energy Community** list, for all subsequent **Energy Community** lists adopted, proposed gas infrastructure projects falling under the categories set out in **Annex I.2** shall be part of the latest available 10-year network development plan for gas, developed by the ENTSO for Gas pursuant Article 8 of Regulation (EC) No 715/2009, **with the exception of those located in a Contracting Party the TSO of which is not a member of ENTSO G. For those, the relevant projects shall be part of national ten year network development plans.**

(5) <...>

(6) <...><sup>22</sup>

(5) For proposed projects falling under the categories set out in **Annex I.1** and 2, national regulatory authorities, and if necessary the **Regulatory Board**, shall, where possible in the context of regional cooperation (Article 6 of Directive 2009/72/EC, Article 7 of Directive 2009/73/EC, **as incorporated and adapted by Ministerial Council Decision 2011/02/MC-EnC**), check the consistent application of the criteria/ cost-benefit analysis methodology and evaluate their cross-border relevance. They shall present their assessment to the Group.

(6) For proposed oil transport projects falling under the categories set out in **Annex I.3**, the **Energy Community Secretariat** shall evaluate the application of the criteria set out in Article 4.

<...>

(7) **Each Contracting Party or the Member State** to whose territory a proposed project does not relate, but on which the proposed project may have a potential net positive impact or a potential significant effect, such as on the environment or on the operation of the energy infrastructure on its

<sup>22</sup> Points (5) and (6) are not applicable according to Article 26(3)(b)(iv) of Ministerial Council Decision 2015/09/MC-EnC.

territory, may present an opinion to the Group specifying its concerns.

(8) The decision-making body of the Group shall examine, **at the request of a Contracting Party or the Member State concerned**, the substantiated reasons presented by a **Contracting Party** pursuant to Article 3(3) for not approving a project of **Energy Community** interest related to its territory.

(9) The Group shall meet to examine and rank the proposed projects taking into account the assessment of the regulators, or the assessment of the **Energy Community Secretariat** for oil transport projects.

(10) The draft **preliminary** lists of proposed projects falling under the categories set out in **Annex I.1 and 2** drawn up by the Groups, together with any opinions as specified in point (7), **shall be submitted to the Energy Community Secretariat, the Regulatory Board and the Agency** six months before the adoption date of the **Energy Community** list. The draft **preliminary** lists and the accompanying opinions shall be assessed by the **Regulatory Board** within three months of the date of receipt. **The Regulatory Board seeking cooperation with the Agency and with the support of the Energy Community Secretariat shall provide an opinion on the draft preliminary lists, in particular on the consistent application of the criteria and cost-benefit analysis.**

<...>

(11) Within one month of the date of receipt of the **Regulatory Board's** opinion, the decision-making body of each Group shall adopt its final **preliminary** list, respecting the provisions set out in Article 3(3), based on the Groups' proposal and taking into account the opinion of the **Regulatory Board** and the assessment of the national regulatory authorities submitted in accordance with point (5), or the assessment of the **Energy Community Secretariat** for oil transport projects proposed in accordance with point (6). The Groups shall submit the final **preliminary** lists to the **Energy Community Secretariat**, together with any opinions as specified in point (7).

(12) If, based on the **preliminary** lists received, and after having taken into account the **Regulatory Board** opinion, the total number of proposed projects of **Energy Community** interest on the **Energy Community** list would exceed a manageable number, **the Permanent High Level Group shall consider**, after having consulted each Group concerned, not to include in the **Energy Community** list projects that were ranked lowest by the Group concerned according to the ranking established pursuant to Article 4(4).

## ANNEX III

## RULES AND INDICATORS CONCERNING CRITERIA FOR PROJECTS OF ENERGY COMMUNITY INTEREST

(1) A project with significant cross-border impact is a project on the territory of a **Contracting Party**, which fulfils the following conditions:

(a) for electricity transmission, the project increases the grid transfer capacity, or the capacity available for commercial flows, at the border of that **Contracting Party with one or several other Contracting Parties and/or Member States**, or at any other relevant cross-section of the same transmission corridor having the effect of increasing this cross-border grid transfer capacity, by at least 500 Megawatt compared to the situation without commissioning of the project;

(b) for electricity storage, the project provides at least 225 MW installed capacity and has a storage capacity that allows a net annual electricity generation of 250 Gigawatt-hours/year;

(c) for gas transmission, the project concerns investment in reverse flow capacities or changes the capability to transmit gas across the **borders of the Contracting Parties and/or Member States** concerned by at least 10% compared to the situation prior to the commissioning of the project;

(d) for gas storage or liquefied/compressed natural gas, the project aims at supplying directly or indirectly **at least two Contracting Parties, and/or one or more Member States** or at fulfilling the infrastructure standard (N-1 rule) at regional level in accordance with Article 6(3) of Regulation (EU) No 994/2010 of the European Parliament and of the Council, **once incorporated in the Energy Community**;

(e) for smart grids, the project is designed for equipments and installations at high-voltage and medium-voltage level designed for a voltage of 10 kV or more. It involves transmission and distribution system operators from at least two **Contracting Parties**, which cover at least 50 000 users that generate or consume electricity or do both in a consumption area of at least 300 Gigawatthours/year, of which at least 20% originate from renewable resources that are variable in nature.

(2) Concerning projects falling under the categories set out in Annex I.1(a) to (c), the criteria listed in Article 4 shall be evaluated as follows:

(a) Market integration, competition and system flexibility shall be measured in line with the analysis made in the latest available Union-wide 10-year network development plan in electricity, notably by:

— calculating, for cross-border projects, the impact on the grid transfer capability in both power flow directions, measured in terms of amount of power (in megawatt), and their contribution to reaching the minimum interconnection capacity of 10% installed production capacity or, for projects with significant cross-border impact, the impact on grid transfer capability at borders **between relevant Contracting Parties and/or with Member States, or within relevant Contracting Parties** and on demand-supply balancing and network operations in relevant **Contracting Parties**,

— assessing the impact, for the area of analysis as defined in Annex IV.6, in terms of energy system-wide generation and transmission costs and evolution and convergence of market prices provided by a project under different planning scenarios, notably taking into account the variations induced on the merit order.

(b) Transmission of renewable energy generation to major consumption centres and storage sites

shall be measured in line with the analysis made in the latest available 10-year network development plan in electricity, notably by:

— for electricity transmission, by estimating the amount of generation capacity from renewable energy sources (by technology, in megawatts), which is connected and transmitted due to the project, compared to the amount of planned total generation capacity from these types of renewable energy sources in the concerned **Contracting Party** in 2020 according to the national renewable energy action plans as defined in Article 4 of Directive 2009/28/EC, **as incorporated and adapted by Ministerial Council Decision 2012/04/MC-EnC**,

— for electricity storage, by comparing new capacity provided by the project with total existing capacity for the same storage technology in the area of analysis as defined in Annex IV.6.

(c) Security of supply, interoperability and secure system operation shall be measured in line with the analysis made in the latest available 10-year network development plan in electricity, notably by assessing the impact of the project on the loss of load expectation for the area of analysis as defined in **Annex IV.6** in terms of generation and transmission adequacy for a set of characteristic load periods, taking into account expected changes in climate-related extreme weather events and their impact on infrastructure resilience. Where applicable, the impact of the project on independent and reliable control of system operation and services shall be measured.

(3) Concerning projects falling under the categories set out in **Annex I.2**, the criteria listed in Article 4 shall be evaluated as follows:

(a) Market integration and interoperability shall be measured by calculating the additional value of the project to the integration of market areas and price convergence, to the overall flexibility of the system, including the capacity level offered for reverse flows under various scenarios.

(b) Competition shall be measured on the basis of diversification, including the facilitation of access to indigenous sources of supply, taking into account, successively: diversification of sources; diversification of counterparts; diversification of routes; the impact of new capacity on the Herfindahl-Hirschmann index (HHI) calculated at capacity level for the area of analysis as defined in **Annex IV.6**.

(c) Security of gas supply shall be measured by calculating the additional value of the project to the short and long-term resilience of the Union's gas system and to enhancing the remaining flexibility of the system to cope with supply disruptions to **Contracting Parties** under various scenarios as well as the additional capacity provided by the project measured in relation to the infrastructure standard (N-1 rule) at regional level in accordance with Article 6(3) of Regulation (EU) No 994/2010, **once incorporated in the Energy Community**.

(d) Sustainability shall be measured as the contribution of a project to reduce emissions, to support the back-up of renewable electricity generation or power-to-gas and biogas transportation, taking into account expected changes in climatic conditions.

(4) Concerning projects falling under the category set out in **Annex I.1(d)**, each function listed in Article 4 shall be evaluated against the following criteria:

(a) Level of sustainability: This criterion shall be measured by assessing the reduction of greenhouse gas emissions, and the environmental impact of electricity grid infrastructure.

(b) Capacity of transmission and distribution grids to connect and bring electricity from and to users: This criterion shall be measured by estimating the installed capacity of distributed energy resources

in distribution networks, the allowable maximum injection of electricity without congestion risks in transmission networks, and the energy not withdrawn from renewable sources due to congestion or security risks.

(c) Network connectivity and access to all categories of network users: This criterion shall be measured by assessing the methods adopted to calculate charges and tariffs, as well as their structure, for generators, consumers and those that do both, and the operational flexibility provided for dynamic balancing of electricity in the network.

(d) Security and quality of supply: This criterion shall be measured by assessing the ratio of reliably available generation capacity and peak demand, the share of electricity generated from renewable sources, the stability of the electricity system, the duration and frequency of interruptions per customer, including climate related disruptions, and the voltage quality performance.

(e) Efficiency and service quality in electricity supply and grid operation: This criterion shall be measured by assessing the level of losses in transmission and in distribution networks, the ratio between minimum and maximum electricity demand within a defined time period, the demand side participation in electricity markets and in energy efficiency measures, the percentage utilisation (i.e. average loading) of electricity network components, the availability of network components (related to planned and unplanned maintenance) and its impact on network performances, and the actual availability of network capacity with respect to its standard value.

(f) Contribution to cross-border electricity markets by load-flow control to alleviate loop-flows and increase interconnection capacities: This criterion shall be estimated by assessing the ratio between interconnection capacity of a **Contracting Party** and its electricity demand, the exploitation of interconnection capacities, and the congestion rents across interconnections.

(5) Concerning oil transport projects falling under the categories set out in **Annex I.3**, the criteria listed in Article 4 shall be evaluated as follows:

(a) Security of oil supply shall be measured by assessing the additional value of the new capacity offered by a project for the short and long-term resilience of the system and the remaining flexibility of the system to cope with supply disruptions under various scenarios.

(b) Interoperability shall be measured by assessing to what extent the project improves the operation of the oil network, in particular by providing the possibility of reverse flows.

(c) Efficient and sustainable use of resources shall be measured by assessing the extent to which the project makes use of already existing infrastructure and contributes to minimising environmental and climate change burden and risks.

## ANNEX IV

## ENERGY SYSTEM-WIDE COST-BENEFIT ANALYSIS

The methodology for a harmonised energy system-wide cost-benefit analysis for projects of **Energy Community** interest shall satisfy the following principles laid down in this Annex.

(1) The methodology shall be based on a common input data set representing the Union's electricity and gas systems in the years n+5, n+10, n+15, and n+20, where n is the year in which the analysis is performed. This data set shall comprise at least:

(a) in electricity: scenarios for demand, generation capacities by fuel type (biomass, geothermal, hydro, gas, nuclear, oil, solid fuels, wind, solar photovoltaic, concentrated solar, other renewable technologies) and their geographical location, fuel prices (including biomass, coal, gas and oil), carbon dioxide prices, the composition of the transmission and, if relevant, the distribution network, and its evolution, taking into account all new significant generation (including capacity equipped for capturing carbon dioxide), storage and transmission projects for which a final investment decision has been taken and that are due to be commissioned by the end of year n+5;

(b) in gas: scenarios for demand, imports, fuel prices (including coal, gas and oil), carbon dioxide prices, the composition of the transmission network and its evolution, taking into account all new projects for which a final investment decision has been taken and that are due to be commissioned by the end of year n+5.

(2) The data set shall reflect Union and national law in force at the date of analysis. The data sets used for electricity and gas respectively shall be compatible, notably with regard to assumptions on prices and volumes in each market. The data set shall be elaborated after formally consulting **Contracting Parties** and the organisations representing all relevant stakeholders. The **Energy Community Secretariat** and the **Regulatory Board** shall ensure access to the required commercial data from third parties when applicable.

(3) The methodology shall give guidance for the development and use of network and market modelling necessary for the cost-benefit analysis.

(4) The cost-benefit analysis shall be based on a harmonised evaluation of costs and benefits for the different categories of projects analysed and cover at least the period of time referred to in point (1).

(5) The cost-benefit analysis shall at least take into account the following costs: capital expenditure, operational and maintenance expenditure over the technical lifecycle of the project and decommissioning and waste management costs, where relevant. The methodology shall give guidance on discount rates to be used for the calculations.

(6) <...>

(7) <...>

(8) <...>

(9) <...><sup>23</sup>

(6) The methodology shall define the analysis to be carried out, based on the relevant input data set, by determining the impacts with and without each project. The area for the analysis of an individual

<sup>23</sup> Points (6), (7), (8) and (9) are not applicable according to Article 26(5)(a) of Ministerial Council Decision 2015/09/MC-EnC.

project shall cover **all Contracting Parties and Member States, on whose territory the project shall be built, all directly neighbouring Contracting Parties and Member States and all other Contracting Parties and Member States significantly impacted by the project.**

(7) The analysis shall identify the **Contracting Parties and Member States** on which the project has net positive impacts (beneficiaries) and those **Contracting Parties and Member States** on which the project has a net negative impact (cost bearers). Each cost-benefit analysis shall include sensitivity analyses concerning the input data set, the commissioning date of different projects in the same area of analysis and other relevant parameters.

(8) Transmission, storage system and compressed and liquefied natural gas terminal operators and distribution system operators shall exchange the information necessary for the elaboration of the methodology, including the relevant network and market modelling. Any transmission or distribution system operator collecting information on behalf of other transmission or distribution system operators shall give back to the participating transmission and distribution system operators the results of the collection of data.

(9) For the common electricity and gas market and network model set out in **paragraph 3** of Article 11, the input data set referred to in point (1) shall cover the years  $n+10$ ,  $n+20$  and  $n+30$  and the model shall allow for a full assessment of economic, social and environmental impacts, notably including external costs such as those related to greenhouse gas and conventional air pollutant emissions or security of supply.

## ANNEX V

### GUIDELINES FOR TRANSPARENCY AND PUBLIC PARTICIPATION

- (1) The manual of procedures referred to in Article 9(1) shall at least specify:
- (a) the relevant law upon which decisions and opinions are based for the different types of relevant projects of **Energy Community** interest, including environmental law;
  - (b) the relevant decisions and opinions to be obtained;
  - (c) the names and contact details of the Competent Authority, other authorities and major stakeholders concerned;
  - (d) the work flow, outlining each stage in the process, including an indicative time frame and a concise overview of the decision-making process;
  - (e) information about the scope, structure and level of detail of documents to be submitted with the application for decisions, including a checklist;
  - (f) the stages and means for the general public to participate in the process.
- (2) The detailed schedule referred to in Article 10(4)(b) shall specify as a minimum the following:
- (a) the decisions and opinions to be obtained;
  - (b) the authorities, stakeholders, and the public likely to be concerned;
  - (c) the individual stages of the procedure and their duration;
  - (d) major milestones to be accomplished and their deadlines in view of the comprehensive decision to be taken;
  - (e) the resources planned by the authorities and possible additional resource needs.
- (3) To increase public participation in the permit granting process and ensure in advance information and dialogue with the public, the following principles shall be applied:
- (a) The stakeholders affected by a project of **Energy Community** interest, including relevant national, regional and local authorities, landowners and citizens living in the vicinity of the project, the general public and their associations, organisations or groups, shall be extensively informed and consulted at an early stage, when potential concerns by the public can still be taken into account and in an open and transparent manner. Where relevant, the competent authority shall actively support the activities undertaken by the project promoter.
  - (b) Competent authorities shall ensure that public consultation procedures for projects of **Energy Community** interest are grouped together where possible. Each public consultation shall cover all subject matters relevant to the particular stage of the procedure, and one subject matter relevant to the particular stage of the procedure shall not be addressed in more than one public consultation; however, one public consultation may take place in more than one geographical location. The subject matters addressed by a public consultation shall be clearly indicated in the notification of the public consultation.
  - (c) Comments and objections shall be admissible from the beginning of the public consultation until the expiry of the deadline only.
- (4) The concept for public participation shall at least include information about:

- (a) the stakeholders concerned and addressed;
  - (b) the measures envisaged, including proposed general locations and dates of dedicated meetings;
  - (c) the timeline;
  - (d) the human resources allocated to the respective tasks.
- (5) In the context of the public consultation to be carried out before submission of the application file, the relevant parties shall at least:
- (a) publish an information leaflet of no more than 15 pages, giving, in a clear and concise manner, an overview of the purpose and preliminary timetable of the project, the national grid development plan, alternative routes considered, expected impacts, including of cross-border nature, and possible mitigation measures, which shall be published prior to the start of the consultation; The information leaflet shall furthermore list the web addresses of the transparency platform referred to in Article 18 and of the manual of procedures referred to in point (1);
  - (b) inform all stakeholders affected about the project through the website referred to in Article 9(7) and other appropriate information means;
  - (c) invite in written form relevant affected stakeholders to dedicated meetings, during which concerns shall be discussed.
- (6) The project website shall make available as a minimum the following:
- (a) the information leaflet referred to in point (5);
  - (b) a non-technical and regularly updated summary of no more than 50 pages reflecting the current status of the project and clearly indicating, in case of updates, changes to previous versions;
  - (c) the project and public consultation planning, clearly indicating dates and locations for public consultations and hearings and the envisaged subject matters relevant for those hearings;
  - (d) contact details in view of obtaining the full set of application documents;
  - (e) contact details in view of conveying comments and objections during public consultations.

---

## **PART II**

ACQUIS COMMUNAUTAIRE

ENVIRONMENT

## **DIRECTIVE 2011/92/EU of 13 December 2011 on the assessment of the effects of certain public and private projects on the environment with amendments introduced by Directive 2014/52/EU of 16 April 2014**

Incorporated and adapted by Ministerial Council Decision 2016/12/MC-EnC of 14 October 2016 on adapting and implementing Directive 2011/92/EU of the European Parliament and of the Council, and amending the Treaty establishing the Energy Community.

*The adaptations made by Ministerial Council Decision 2016/12/MC-EnC are highlighted in **bold and blue**, the changes to Directive 2011/92/EU introduced by Directive 2014/52/EU are highlighted in **bold**.*

Whereas:

- (1) Council Directive 85/337/EEC of 27 June 1985 on the assessment of the effects of certain public and private projects on the environment has been substantially amended several times. In the interests of clarity and rationality the said Directive should be codified.
- (2) Pursuant to Article 191 of the Treaty on the Functioning of the European Union, Union policy on the environment is based on the precautionary principle and on the principles that preventive action should be taken, that environmental damage should, as a priority, be rectified at source and that the polluter should pay. Effects on the environment should be taken into account at the earliest possible stage in all the technical planning and decision-making processes.
- (3) The principles of the assessment of environmental effects should be harmonised, in particular with reference to the projects which should be subject to assessment, the main obligations of the developers and the content of the assessment. The Member States may lay down stricter rules to protect the environment.
- (4) In addition, it is necessary to achieve one of the objectives of the Union in the sphere of the protection of the environment and the quality of life.
- (5) The environmental legislation of the Union includes provisions enabling public authorities and other bodies to take decisions which may have a significant effect on the environment as well as on personal health and well-being.
- (6) General principles for the assessment of environmental effects should be laid down with a view to supplementing and coordinating development consent procedures governing public and private projects likely to have a major effect on the environment.
- (7) Development consent for public and private projects which are likely to have significant effects on the environment should be granted only after an assessment of the likely significant environmental effects of those projects has been carried out. That assessment should be conducted on the basis of the appropriate information supplied by the developer, which may be supplemented by the authorities and by the public likely to be concerned by the project in question.
- (8) Projects belonging to certain types have significant effects on the environment and those projects should, as a rule, be subject to a systematic assessment.
- (9) Projects of other types may not have significant effects on the environment in every case and those projects should be assessed where the Member States consider that they are likely to have

significant effects on the environment.

(10) Member States may set thresholds or criteria for the purpose of determining which of such projects should be subject to assessment on the basis of the significance of their environmental effects. Member States should not be required to examine projects below those thresholds or outside those criteria on a case-by-case basis.

(11) When setting such thresholds or criteria or examining projects on a case-by-case basis, for the purpose of determining which projects should be subject to assessment on the basis of their significant environmental effects, Member States should take account of the relevant selection criteria set out in this Directive. In accordance with the subsidiarity principle, the Member States are in the best position to apply those criteria in specific instances.

(12) For projects which are subject to assessment, a certain minimal amount of information should be supplied, concerning the project and its effects.

(13) It is appropriate to lay down a procedure in order to enable the developer to obtain an opinion from the competent authorities on the content and extent of the information to be elaborated and supplied for the assessment. Member States, in the framework of this procedure, may require the developer to provide, *inter alia*, alternatives for the projects for which it intends to submit an application.

(14) The effects of a project on the environment should be assessed in order to take account of concerns to protect human health, to contribute by means of a better environment to the quality of life, to ensure maintenance of the diversity of species and to maintain the reproductive capacity of the ecosystem as a basic resource for life.

(15) It is desirable to lay down strengthened provisions concerning environmental impact assessment in a transboundary context to take account of developments at international level. The European Community signed the Convention on Environmental Impact Assessment in a Transboundary Context on 25 February 1991, and ratified it on 24 June 1997.

(16) Effective public participation in the taking of decisions enables the public to express, and the decision-maker to take account of, opinions and concerns which may be relevant to those decisions, thereby increasing the accountability and transparency of the decision-making process and contributing to public awareness of environmental issues and support for the decisions taken.

(17) Participation, including participation by associations, organisations and groups, in particular non-governmental organisations promoting environmental protection, should accordingly be fostered, including, *inter alia*, by promoting environmental education of the public.

(18) The European Community signed the UNECE Convention on Access to Information, Public Participation in Decision-Making and Access to Justice in Environmental Matters (the Aarhus Convention) on 25 June 1998 and ratified it on 17 February 2005.

(19) Among the objectives of the Aarhus Convention is the desire to guarantee rights of public participation in decision-making in environmental matters in order to contribute to the protection of the right to live in an environment which is adequate for personal health and well-being.

(20) Article 6 of the Aarhus Convention provides for public participation in decisions on the specific activities listed in Annex I thereto and on activities not so listed which may have a significant effect on the environment.

(21) Article 9(2) and (4) of the Aarhus Convention provides for access to judicial or other procedures

for challenging the substantive or procedural legality of decisions, acts or omissions subject to the public participation provisions of Article 6 of that Convention.

(22) However, this Directive should not be applied to projects the details of which are adopted by a specific act of national legislation, since the objectives of this Directive, including that of supplying information, are achieved through the legislative process.

(23) Furthermore, it may be appropriate in exceptional cases to exempt a specific project from the assessment procedures laid down by this Directive, subject to appropriate information being supplied to the Commission and to the public concerned.

(24) Since the objectives of this Directive cannot be sufficiently achieved by the Member States and can therefore, by reason of the scale and effects of the action, be better achieved at Union level, the Union may adopt measures in accordance with the principle of subsidiarity as set out in Article 5 of the Treaty on European Union. In accordance with the principle of proportionality, as set out in that Article, this Directive does not go beyond what is necessary in order to achieve those objectives.

(25) This Directive should be without prejudice to the obligations of the Member States relating to the time limits for transposition into national law of the Directives set out in Annex V, Part B.

### **Article 1**

1. This Directive shall apply to the assessment of the environmental effects of those public and private projects which are likely to have significant effects on the environment.

2. For the purposes of this Directive, the following definitions shall apply:

(a) 'project' means:

- the execution of construction works or of other installations or schemes,
- other interventions in the natural surroundings and landscape including those involving the extraction of mineral resources;

(b) 'developer' means the applicant for authorisation for a private project or the public authority which initiates a project;

(c) 'development consent' means the decision of the competent authority or authorities which entitles the developer to proceed with the project;

(d) 'public' means one or more natural or legal persons and, in accordance with national legislation or practice, their associations, organisations or groups;

(e) 'public concerned' means the public affected or likely to be affected by, or having an interest in, the environmental decision-making procedures referred to in Article 2(2). For the purposes of this definition, non-governmental organisations promoting environmental protection and meeting any requirements under national law shall be deemed to have an interest;

(f) 'competent authority or authorities' means that authority or those authorities which the **Contracting Parties** designate as responsible for performing the duties arising from this Directive.

**(g) 'environmental impact assessment' means a process consisting of:**

- (i) the preparation of an environmental impact assessment report by the developer, as referred to in Article 5(1) and (2);**

(ii) the carrying out of consultations as referred to in Article 6 and, where relevant, Article 7;

(iii) the examination by the competent authority of the information presented in the environmental impact assessment report and any supplementary information provided, where necessary, by the developer in accordance with Article 5(3), and any relevant information received through the consultations under Articles 6 and 7;

(iv) the reasoned conclusion by the competent authority on the significant effects of the project on the environment, taking into account the results of the examination referred to in point (iii) and, where appropriate, its own supplementary examination; and

(v) the integration of the competent authority's reasoned conclusion into any of the decisions referred to in Article 8a.

3. **Contracting Parties** may decide, on a case-by-case basis if so provided under national law, not to apply this Directive to projects, **or parts of projects, having defence as their sole purpose, or to projects having the response to civil emergencies as their sole purpose**, if they deem that such application would have an adverse effect on those purposes.

## *Article 2*

1. **Contracting Parties** shall adopt all measures necessary to ensure that, before **development** consent is given, projects likely to have significant effects on the environment by virtue, *inter alia*, of their nature, size or location are made subject to a requirement for development consent and an assessment with regard to their effects **on the environment**. Those projects are defined in Article 4.

2. The environmental impact assessment may be integrated into the existing procedures for **development** consent to projects in the **Contracting Parties**, or, failing this, into other procedures or into procedures to be established to comply with the aims of this Directive.

3. **In the case of projects for which the obligation to carry out assessments of the effects on the environment arises simultaneously from this Directive and from Council Directive 92/43/EEC and/or Directive 2009/147/EC of the European Parliament and the Council, Contracting Parties shall, where appropriate, ensure that coordinated and/or joint procedures fulfilling the requirements of that Union legislation are provided for.**

**In the case of projects for which the obligation to carry out assessments of the effects on the environment arises simultaneously from this Directive and Union legislation other than the Directives listed in the first subparagraph, Contracting Parties may provide for coordinated and/or joint procedures.**

**Under the coordinated procedure referred to in the first and second subparagraphs, Contracting Parties shall endeavour to coordinate the various individual assessments of the environmental impact of a particular project, required by the relevant Union legislation, by designating an authority for this purpose, without prejudice to any provisions to the contrary contained in other relevant Union legislation.**

**Under the joint procedure referred to in the first and second subparagraphs, Contracting Parties shall endeavour to provide for a single assessment of the environmental impact of a particular project required by the relevant Union legislation, without prejudice to any**

provisions to the contrary contained in other relevant Union legislation.

The **Secretariat** shall provide guidance regarding the setting up of any coordinated or joint procedures for projects that are simultaneously subject to assessments under this Directive and Directives 92/43/EEC, 2000/60/EC, 2009/147/EC or 2010/75/EU.

4. Without prejudice to Article 7, **Contracting Parties** may, in exceptional cases, exempt a specific project from the provisions laid down in this Directive, **where the application of those provisions would result in adversely affecting the purpose of the project, provided the objectives of this Directive are met.**

In that event, the **Contracting Parties** shall:

- (a) consider whether another form of assessment would be appropriate;
- (b) make available to the public concerned the information obtained under other forms of assessment referred to in point (a), the information relating to the decision granting exemption and the reasons for granting it;
- (c) inform the **Secretariat**, prior to granting consent, of the reasons justifying the exemption granted, and provide it with the information made available, where applicable, to their own nationals.

The **Secretariat** shall immediately forward the documents received to the other **Contracting Parties**.

The **Secretariat** shall report annually to the European Parliament and to the Council on the application of this paragraph.

**5. Without prejudice to Article 7, in cases where a project is adopted by a specific act of national legislation, Contracting Parties may exempt that project from the provisions relating to public consultation laid down in this Directive, provided the objectives of this Directive are met.**

**Contracting Parties shall inform the Secretariat of any application of the exemption referred to in the first subparagraph every two years from 16 May 2017.**

### Article 3

The environmental impact assessment shall identify, describe and assess in an appropriate manner, in the light of each individual case and in accordance with Articles 4 to 12, the direct and **significant indirect** effects of a project on the following factors:

- (a) population and human health;**
- (b) biodiversity, with particular attention to species and habitats protected under Directive 92/43/EEC and Directive 2009/147/EC;**
- (c) land, soil, water, air and climate;**
- (d) material assets, cultural heritage and the landscape;
- (e) the interaction between the factors referred to in points (a) to (d).

**2. The effects referred to in paragraph 1 on the factors set out therein shall include the expected effects deriving from the vulnerability of the project to risks of major accidents and/or disasters that are relevant to the project concerned.**

#### Article 4

1. Subject to Article 2(4), projects listed in Annex I shall be made subject to an assessment in accordance with Articles 5 to 10.

2. Subject to Article 2(4), for projects listed in Annex II, **Contracting Parties** shall determine whether the project shall be made subject to an assessment in accordance with Articles 5 to 10. **Contracting Parties** shall make that determination through:

(a) a case-by-case examination; or

(b) thresholds or criteria set by the **Contracting Party**.

**Contracting Parties** may decide to apply both procedures referred to in points (a) and (b).

3. Where a case-by-case examination is carried out or thresholds or criteria are set for the purpose of paragraph 2, the relevant selection criteria set out in Annex III shall be taken into account. **Contracting Parties may set thresholds or criteria to determine when projects need not undergo either the determination under paragraphs 4 and 5 or an environmental impact assessment, and/or thresholds or criteria to determine when projects shall in any case be made subject to an environmental impact assessment without undergoing a determination set out under paragraphs 4 and 5.**

4. Where **Contracting Parties** decide to require a determination for projects listed in Annex II, the developer shall provide information on the characteristics of the project and its likely significant effects on the environment. The detailed list of information to be provided is specified in Annex IIA. The developer shall take into account, where relevant, the available results of other relevant assessments of the effects on the environment carried out pursuant to Union legislation other than this Directive. The developer may also provide a description of any features of the project and/or measures envisaged to avoid or prevent what might otherwise have been significant adverse effects on the environment.

5. The competent authority shall make its determination, on the basis of the information provided by the developer in accordance with paragraph 4 taking into account, where relevant, the results of preliminary verifications or assessments of the effects on the environment carried out pursuant to Union legislation other than this Directive. The determination shall be made available to the public and:

(a) where it is decided that an environmental impact assessment is required, state the main reasons for requiring such assessment with reference to the relevant criteria listed in Annex III; or

(b) where it is decided that an environmental impact assessment is not required, state the main reasons for not requiring such assessment with reference to the relevant criteria listed in Annex III, and, where proposed by the developer, state any features of the project and/or measures envisaged to avoid or prevent what might otherwise have been significant adverse effects on the environment.

6. **Contracting Parties** shall ensure that the competent authority makes its determination as soon as possible and within a period of time not exceeding 90 days from the date on which the developer has submitted all the information required pursuant to paragraph 4. In exceptional cases, for instance relating to the nature, complexity, location or size of the

project, the competent authority may extend that deadline to make its determination; in that event, the competent authority shall inform the developer in writing of the reasons justifying the extension and of the date when its determination is expected.

### *Article 5*

**1. Where an environmental impact assessment is required, the developer shall prepare and submit an environmental impact assessment report.** The information to be provided by the developer shall include at least:

- (a)** a description of the project comprising information on the site, design, size **and other relevant features** of the project;
- (b)** a description of the likely significant effects of the project on the environment;
- (c)** a description of the **features of the project and/or** measures envisaged in order to avoid, prevent or reduce and, if possible, **offset likely** significant adverse effects **on the environment**;
- (d)** a description of the reasonable alternatives studied by the developer, **which are relevant to the project and its specific characteristics**, and an indication of the main reasons for the option chosen, taking into account the effects of the project on the environment;
- (e)** a non-technical summary of the information referred to in points (a) to (d); **and**
- (f)** any additional information specified in Annex IV relevant to the specific characteristics of a particular project or type of project and to the environmental features likely to be affected.

Where an opinion is issued pursuant to paragraph 2, the environmental impact assessment report shall be based on that opinion, and include the information that may reasonably be required for reaching a reasoned conclusion on the significant effects of the project on the environment, taking into account current knowledge and methods of assessment. The developer shall, with a view to avoiding duplication of assessments, take into account the available results of other relevant assessments under Union or national legislation, in preparing the environmental impact assessment report.

2. Where requested by the developer, the competent authority, taking into account the information provided by the developer **in particular on the specific characteristics of the project, including its location and technical capacity, and its likely impact on the environment**, shall issue an opinion **on the scope and level of detail of the information to be included by the developer in the environmental impact assessment report in accordance with paragraph 1 of this Article**. The competent authority shall consult the authorities referred to in Article 6(1) before it gives its opinion.

**Contracting Parties** may also require the competent authorities to give an opinion as referred to in the first subparagraph, irrespective of whether the developer so requests.

**3. In order to ensure the completeness and quality of the environmental impact assessment report:**

- (a)** the developer shall ensure that the environmental impact assessment report is prepared by competent experts;

**(b) the competent authority shall ensure that it has, or has access as necessary to, sufficient expertise to examine the environmental impact assessment report; and**

**(c) where necessary, the competent authority shall seek from the developer supplementary information, in accordance with Annex IV, which is directly relevant to reaching the reasoned conclusion on the significant effects of the project on the environment.**

4. **Contracting Parties** shall, if necessary, ensure that any authorities holding relevant information, with particular reference to Article 3, make this information available to the developer.

### *Article 6*

1. **Contracting Parties** shall take the measures necessary to ensure that the authorities likely to be concerned by the project by reason of their specific environmental responsibilities **or local and regional competences** are given an opportunity to express their opinion on the information supplied by the developer and on the request for development consent, **taking into account, where appropriate, the cases referred to in Article 8a(3)**. To that end, **Contracting Parties** shall designate the authorities to be consulted, either in general terms or on a case-by-case basis. The information gathered pursuant to Article 5 shall be forwarded to those authorities. Detailed arrangements for consultation shall be laid down by the **Contracting Parties**.

2. **In order to ensure the effective participation of the public concerned in the decision-making procedures, the public shall be informed electronically or** by public notices or by other appropriate means, of the following matters early in the environmental decision-making procedures referred to in Article 2(2) and, at the latest, as soon as information can reasonably be provided:

- (a) the request for development consent;
- (b) the fact that the project is subject to an environmental impact assessment procedure and, where relevant, the fact that Article 7 applies;
- (c) details of the competent authorities responsible for taking the decision, those from which relevant information can be obtained, those to which comments or questions can be submitted, and details of the time schedule for transmitting comments or questions;
- (d) the nature of possible decisions or, where there is one, the draft decision;
- (e) an indication of the availability of the information gathered pursuant to Article 5;
- (f) an indication of the times and places at which, and the means by which, the relevant information will be made available;
- (g) details of the arrangements for public participation made pursuant to paragraph 5 of this Article.

3. **Contracting Parties** shall ensure that, within reasonable time-frames, the following is made available to the public concerned:

- (a) any information gathered pursuant to Article 5;
- (b) in accordance with national legislation, the main reports and advice issued to the competent authority or authorities at the time when the public concerned is informed in accordance with paragraph 2 of this Article;
- (c) in accordance with the provisions of Directive 2003/4/EC of the European Parliament and of the Council of 28 January 2003 on public access to environmental information other than that referred

to in paragraph 2 of this Article which is relevant for the decision in accordance with Article 8 of this Directive and which only becomes available after the time the public concerned was informed in accordance with paragraph 2 of this Article.

4. The public concerned shall be given early and effective opportunities to participate in the environmental decision-making procedures referred to in Article 2(2) and shall, for that purpose, be entitled to express comments and opinions when all options are open to the competent authority or authorities before the decision on the request for development consent is taken.

5. The detailed arrangements for informing the public for example by bill posting within a certain radius or publication in local newspapers, and for consulting the public concerned, for example by written submissions or by way of a public inquiry, shall be determined by the **Contracting Parties**. **Contracting Parties shall take the necessary measures to ensure that the relevant information is electronically accessible to the public, through at least a central portal or easily accessible points of access, at the appropriate administrative level.**

6. Reasonable time-frames for the different phases shall be provided **for**, allowing sufficient time for:

- (a) informing the authorities referred to in paragraph 1 and the public; and**
- (b) the authorities referred to in paragraph 1 and the public concerned to prepare and participate effectively in the environmental decision-making, subject to the provisions of this Article.**

7. The time-frames for consulting the public concerned on the environmental impact assessment report referred to in Article 5(1) shall not be shorter than 30 days.

#### *Article 4 of Decision 2016/12/MC-EnC*

**In case of projects of Energy Community interest, the Contracting Party in whose territory the project is intended to be carried out shall send the following information to the Secretariat as soon as possible and no later than when informing its own public:**

- (a) a description of the project, together with any available information on its impacts on the environment;**
- (b) information on the nature of the decision which may be taken for authorisation of the project.**

**The Secretariat shall ensure that the environmental impact assessments of the projects referred to in paragraph 1 of this Article fulfil the requirements of Directive 2011/92/EU as amended by Directive 2014/52/EU.**

## **Article 7**

1. Where a **Contracting Party** is aware that a project is likely to have significant effects on the environment in another **Contracting Party** or where a **Contracting Party** likely to be significantly affected so requests, the **Contracting Party** in whose territory the project is intended to be carried out shall send to the affected **Contracting Party** as soon as possible and no later than when informing its own public, *inter alia*:

(a) a description of the project, together with any available information on its possible transboundary impact;

(b) information on the nature of the decision which may be taken.

The **Contracting Party** in whose territory the project is intended to be carried out shall give the other **Contracting Party** a reasonable time in which to indicate whether it wishes to participate in the environmental decision-making procedures referred to in Article 2(2), and may include the information referred to in paragraph 2 of this Article.

2. If a **Contracting Party** which receives information pursuant to paragraph 1 indicates that it intends to participate in the environmental decision-making procedures referred to in Article 2(2), the **Contracting Party** in whose territory the project is intended to be carried out shall, if it has not already done so, send to the affected **Contracting Party** the information required to be given pursuant to Article 6(2) and made available pursuant to points (a) and (b) of Article 6(3).

3. The **Contracting Parties** concerned, each insofar as it is concerned, shall also:

(a) arrange for the information referred to in paragraphs 1 and 2 to be made available, within a reasonable time, to the authorities referred to in Article 6(1) and the public concerned in the territory of the **Contracting Party** likely to be significantly affected; and

(b) ensure that the authorities referred to in Article 6(1) and the public concerned are given an opportunity, before development consent for the project is granted, to forward their opinion within a reasonable time on the information supplied to the competent authority in the **Contracting Party** in whose territory the project is intended to be carried out.

4. The **Contracting Parties** concerned shall enter into consultations regarding, *inter alia*, the potential transboundary effects of the project and the measures envisaged to reduce or eliminate such effects and shall agree on a reasonable time-frame for the duration of the consultation period.

**Such consultations may be conducted through an appropriate joint body.**

5. The detailed arrangements for implementing **paragraph 1 to 4** of this Article, **including the establishment of time-frames for consultations, shall** be determined by the **Contracting Parties** concerned, **on the basis of the arrangements and time-frames referred to in Article 6(5) to (7)**, and shall be such as to enable the public concerned in the territory of the affected **Contracting Party** to participate effectively in the environmental decision-making procedures referred to in Article 2(2) for the project.

### Article 8

The results of consultations and the information gathered pursuant to Articles 5 to 7 **shall be duly** taken into **account** in the development consent procedure.

#### Article 8a

1. The decision to grant development consent shall incorporate at least the following information:

(a) the reasoned conclusion referred to in Article 1(2)(g)(iv);

(b) any environmental conditions attached to the decision, a description of any features of the project and/or measures envisaged to avoid, prevent or reduce and, if possible, offset significant adverse effects on the environment as well as, where appropriate, monitoring measures.

2. The decision to refuse development consent shall state the main reasons for the refusal.

3. In the event **Contracting Parties** make use of the procedures referred to in Article 2(2) other than the procedures for development consent, the requirements of paragraphs 1 and 2 of this Article, as appropriate, shall be deemed to be fulfilled when any decision issued in the context of those procedures contains the information referred to in those paragraphs and there are mechanisms in place which enable the fulfilment of the requirements of paragraph 6 of this Article.

4. In accordance with the requirements referred to in paragraph 1(b), **Contracting Parties** shall ensure that the features of the project and/or measures envisaged to avoid, prevent or reduce and, if possible, offset significant adverse effects on the environment are implemented by the developer, and shall determine the procedures regarding the monitoring of significant adverse effects on the environment.

The type of parameters to be monitored and the duration of the monitoring shall be proportionate to the nature, location and size of the project and the significance of its effects on the environment.

Existing monitoring arrangements resulting from Union legislation other than this Directive and from national legislation may be used if appropriate, with a view to avoiding duplication of monitoring.

5. **Contracting Parties** shall ensure that the competent authority takes any of the decisions referred to in paragraphs 1 to 3 within a reasonable period of time.

6. The competent authority shall be satisfied that the reasoned conclusion referred to in Article 1(2)(g)(iv), or any of the decisions referred to in paragraph 3 of this Article, is still up to date when taking a decision to grant development consent. To that effect, **Contracting Parties** may set time-frames for the validity of the reasoned conclusion referred to in Article 1(2)(g)(iv) or any of the decisions referred to in paragraph 3 of this Article.

### Article 9

1. When a decision to grant or refuse development consent has been taken, the competent authority or authorities shall **promptly** inform the public **and the authorities referred to in Article 6(1)** thereof, in accordance with the **national** procedures, and shall **ensure that the following information is available to the public and to the authorities referred to in Article 6(1), taking into account, where appropriate, the cases referred to in Article 8a(3):**

(a) the content of the decision and any conditions attached thereto **as referred to in Article 8a(1) and (2);**

(b) the main reasons and considerations on which the decision is based, including information about the public participation process. **This also includes the summary of the results of the consultations and the information gathered pursuant to Articles 5 to 7 and how those results have been incorporated or otherwise addressed, in particular the comments received from the affected Contracting Party referred to in Article 7.**

2. The competent authority or authorities shall inform any **Contracting Party** which has been consulted pursuant to Article 7, forwarding to it the information referred to in paragraph 1 of this Article.

The consulted **Contracting Parties** shall ensure that that information is made available in an appropriate manner to the public concerned in their own territory.

### Article 9a

**Contracting Parties** shall ensure that the competent authority or authorities perform the duties arising from this Directive in an objective manner and do not find themselves in a situation giving rise to a conflict of interest.

Where the competent authority is also the developer, **Contracting Parties** shall at least implement, within their organisation of administrative competences, an appropriate separation between conflicting functions when performing the duties arising from this Directive.

### Article 10

**Without prejudice to Directive 2003/4/EC**, the provisions of this Directive shall not affect the obligation on the competent authorities to respect the limitations imposed by national laws, regulations and administrative provisions and accepted legal practices with regard to commercial and industrial confidentiality, including intellectual property, and the safeguarding of the public interest.

Where Article 7 applies, the transmission of information to another **Contracting Party** and the receipt of information by another **Contracting Party** shall be subject to the limitations in force in the **Contracting Party** in which the project is proposed.

### **Article 10a**

**Contracting Parties** shall lay down rules on penalties applicable to infringements of the national provisions adopted pursuant to this Directive. The penalties thus provided for shall be effective, proportionate and dissuasive.

### **Article 11**

1. **Contracting Parties** shall ensure that, in accordance with the relevant national legal system, members of the public concerned:

(a) having a sufficient interest, or alternatively;

(b) maintaining the impairment of a right, where administrative procedural law of a **Contracting Party** requires this as a precondition;

have access to a review procedure before a court of law or another independent and impartial body established by law to challenge the substantive or procedural legality of decisions, acts or omissions subject to the public participation provisions of this Directive.

2. **Contracting Parties** shall determine at what stage the decisions, acts or omissions may be challenged.

3. What constitutes a sufficient interest and impairment of a right shall be determined by the **Contracting Parties**, consistently with the objective of giving the public concerned wide access to justice. To that end, the interest of any non-governmental organisation meeting the requirements referred to in Article 1(2) shall be deemed sufficient for the purpose of point (a) of paragraph 1 of this Article. Such organisations shall also be deemed to have rights capable of being impaired for the purpose of point (b) of paragraph 1 of this Article.

4. The provisions of this Article shall not exclude the possibility of a preliminary review procedure before an administrative authority and shall not affect the requirement of exhaustion of administrative review procedures prior to recourse to judicial review procedures, where such a requirement exists under national law.

Any such procedure shall be fair, equitable, timely and not prohibitively expensive.

5. In order to further the effectiveness of the provisions of this Article, **Contracting Parties** shall ensure that practical information is made available to the public on access to administrative and judicial review procedures.

### **Article 12**

1. The **Contracting Parties** and the **Secretariat** shall exchange information on the experience gained in applying this Directive.

2. **In particular, every six years from 16 May 2017 Contracting Parties shall inform the Secretariat, where such data are available, of:**

**(a) the number of projects referred to in Annexes I and II made subject to an environmental**

**impact assessment in accordance with Articles 5 to 10;**

**(b) the breakdown of environmental impact assessments according to the project categories set out in Annexes I and II;**

**(c) the number of projects referred to in Annex II made subject to a determination in accordance with Article 4(2);**

**(d) the average duration of the environmental impact assessment process;**

**(e) general estimates on the average direct costs of environmental impact assessments, including the impact from the application of this Directive to SMEs.**

3. On the basis of that exchange of information, the **Secretariat** shall if necessary submit additional proposals to the European Parliament and to the Council, with a view to ensuring that this Directive is applied in a sufficiently coordinated manner.

### **Article 13**

**Contracting Parties** shall communicate to the **Secretariat** the texts of the provisions of national law which they adopt in the field covered by this Directive.

### **Article 14**

Directive 85/337/EEC, as amended by the Directives listed in Annex V, Part A, is repealed, without prejudice to the obligations of the **Contracting Parties** relating to the time limits for transposition into national law of the Directives set out in Annex V, Part B.

References to the repealed Directive shall be construed as references to this Directive and shall be read in accordance with the correlation table in Annex VI.

### **Article 15**

**Contracting Parties shall bring into force the laws, regulations and administrative provisions necessary to comply with Directive 2011/92/EU as amended by Directive 2014/52/EU by 1 January 2019 with the exception of the provisions referring to Directives not covered by Article 16 of the Treaty establishing the Energy Community.<sup>1, 2</sup>**

### **Article 16**

This Directive is addressed to the **Contracting Parties**.

<sup>1</sup> The text displayed here corresponds to Article 2(1) of Decision 2016/12/MC-EnC. Until 1 January 2019, Directive 2011/92/EU applies without the amendments enacted by Directive 2014/52/EU.

<sup>2</sup> The Accession Protocol of Georgia to the Energy Community Treaty refers to Directive 85/337/EEC and sets deadlines thereto. Directive 85/337/EEC was repealed by Decision 2016/12/MC-EnC adapting and implementing Directive 2011/92/EU on the assessment of the effects of certain public and private projects on the environment. Without prejudice to commitments under EU-Georgia Association Agreement the date for the implementation of the entire Directive is 1 September 2017.

## ANNEX I

### PROJECTS REFERRED TO IN ARTICLE 4(1)

1. Crude-oil refineries (excluding undertakings manufacturing only lubricants from crude oil) and installations for the gasification and liquefaction of 500 tonnes or more of coal or bituminous shale per day.
2. (a) Thermal power stations and other combustion installations with a heat output of 300 megawatts or more;
  - (b) Nuclear power stations and other nuclear reactors including the dismantling or decommissioning of such power stations or reactors<sup>3</sup> (except research installations for the production and conversion of fissionable and fertile materials, whose maximum power does not exceed 1 kilowatt continuous thermal load).
3. (a) Installations for the reprocessing of irradiated nuclear fuel;
  - (b) Installations designed:
    - (i) for the production or enrichment of nuclear fuel;
    - (ii) for the processing of irradiated nuclear fuel or high-level radioactive waste;
    - (iii) for the final disposal of irradiated nuclear fuel;
    - (iv) solely for the final disposal of radioactive waste;
    - (v) solely for the storage (planned for more than 10 years) of irradiated nuclear fuels or radioactive waste in a different site than the production site.
4. (a) Integrated works for the initial smelting of cast iron and steel;
  - (b) Installations for the production of non-ferrous crude metals from ore, concentrates or secondary raw materials by metallurgical, chemical or electrolytic processes.
5. Installations for the extraction of asbestos and for the processing and transformation of asbestos and products containing asbestos: for asbestos-cement products, with an annual production of more than 20 000 tonnes of finished products, for friction material, with an annual production of more than 50 tonnes of finished products, and for other uses of asbestos, utilisation of more than 200 tonnes per year.
6. Integrated chemical installations, i.e. those installations for the manufacture on an industrial scale of substances using chemical conversion processes, in which several units are juxtaposed and are functionally linked to one another and which are:
  - (a) for the production of basic organic chemicals;
  - (b) for the production of basic inorganic chemicals;
  - (c) for the production of phosphorous-, nitrogen- or potassium-based fertilisers (simple or compound fertilisers);
  - (d) for the production of basic plant health products and of biocides;
  - (e) for the production of basic pharmaceutical products using a chemical or biological process;

<sup>3</sup> Nuclear power stations and other nuclear reactors cease to be such an installation when all nuclear fuel and other radioactively contaminated elements have been removed permanently from the installation site.

(f) for the production of explosives.

7. (a) Construction of lines for long-distance railway traffic and of airports<sup>4</sup> with a basic runway length of 2 100 m or more;

(b) Construction of motorways and express roads<sup>5</sup>;

(c) Construction of a new road of four or more lanes, or realignment and/or widening of an existing road of two lanes or less so as to provide four or more lanes, where such new road or realigned and/or widened section of road would be 10 km or more in a continuous length.

8. (a) Inland waterways and ports for inland-waterway traffic which permit the passage of vessels of over 1 350 tonnes;

(b) Trading ports, piers for loading and unloading connected to land and outside ports (excluding ferry piers) which can take vessels of over 1 350 tonnes.

9. Waste disposal installations for the incineration, chemical treatment as defined in Annex I to Directive 2008/98/EC of the European Parliament and of the Council of 19 November 2008 on waste under heading D9, or landfill of hazardous waste, as defined in point 2 of Article 3 of that Directive.

10. Waste disposal installations for the incineration or chemical treatment as defined in Annex I to Directive 2008/98/EC under heading D9 of non-hazardous waste with a capacity exceeding 100 tonnes per day.

11. Groundwater abstraction or artificial groundwater recharge schemes where the annual volume of water abstracted or recharged is equivalent to or exceeds 10 million cubic metres.

12. (a) Works for the transfer of water resources between river basins where that transfer aims at preventing possible shortages of water and where the amount of water transferred exceeds 100 million cubic metres/year;

(b) In all other cases, works for the transfer of water resources between river basins where the multi-annual average flow of the basin of abstraction exceeds 2 000 million cubic metres/year and where the amount of water transferred exceeds 5% of that flow.

In both cases transfers of piped drinking water are excluded.

13. Waste water treatment plants with a capacity exceeding 150 000 population equivalent as defined in point 6 of Article 2 of Council Directive 91/271/EEC of 21 May 1991 concerning urban waste-water treatment.

14. Extraction of petroleum and natural gas for commercial purposes where the amount extracted exceeds 500 tonnes/day in the case of petroleum and 500 000 cubic metres/day in the case of gas.

15. Dams and other installations designed for the holding back or permanent storage of water, where a new or additional amount of water held back or stored exceeds 10 million cubic metres.

16. Pipelines with a diameter of more than 800 mm and a length of more than 40 km:

(a) for the transport of gas, oil, chemicals;

(b) for the transport of carbon dioxide (CO<sub>2</sub>) streams for the purposes of geological storage, including associated booster stations.

<sup>4</sup> For the purposes of this Directive, 'airport' means an airport which complies with the definition in the 1944 Chicago Convention setting up the International Civil Aviation Organisation (Annex 14).

<sup>5</sup> For the purposes of this Directive, 'express road' means a road which complies with the definition in the European Agreement on Main International Traffic Arteries of 15 November 1975.

17. Installations for the intensive rearing of poultry or pigs with more than:
- (a) 85 000 places for broilers, 60 000 places for hens;
  - (b) 3 000 places for production pigs (over 30 kg); or
  - (c) 900 places for sows.
18. Industrial plants for the production of:
- (a) pulp from timber or similar fibrous materials;
  - (b) paper and board with a production capacity exceeding 200 tonnes per day.
19. Quarries and open-cast mining where the surface of the site exceeds 25 hectares, or peat extraction, where the surface of the site exceeds 150 hectares.
20. Construction of overhead electrical power lines with a voltage of 220 kV or more and a length of more than 15 km.
21. Installations for storage of petroleum, petrochemical, or chemical products with a capacity of 200 000 tonnes or more.
22. Storage sites pursuant to Directive 2009/31/EC of the European Parliament and of the Council of 23 April 2009 on the geological storage of carbon dioxide.
23. Installations for the capture of CO<sub>2</sub> streams for the purposes of geological storage pursuant to Directive 2009/31/EC from installations covered by this Annex, or where the total yearly capture of CO<sub>2</sub> is 1,5 megatonnes or more.
24. Any change to or extension of projects listed in this Annex where such a change or extension in itself meets the thresholds, if any, set out in this Annex.

## ANNEX II

### PROJECTS REFERRED TO IN ARTICLE 4(2)

#### 1. AGRICULTURE, SILVICULTURE AND AQUACULTURE

- (a) Projects for the restructuring of rural land holdings;
- (b) Projects for the use of uncultivated land or semi-natural areas for intensive agricultural purposes;
- (c) Water management projects for agriculture, including irrigation and land drainage projects;
- (d) Initial afforestation and deforestation for the purposes of conversion to another type of land use;
- (e) Intensive livestock installations (projects not included in Annex I);
- (f) Intensive fish farming;
- (g) Reclamation of land from the sea.

#### 2. EXTRACTIVE INDUSTRY

- (a) Quarries, open-cast mining and peat extraction (projects not included in Annex I);
- (b) Underground mining;
- (c) Extraction of minerals by marine or fluvial dredging;
- (d) Deep drillings, in particular:
  - (i) geothermal drilling;
  - (ii) drilling for the storage of nuclear waste material;
  - (iii) drilling for water supplies;with the exception of drillings for investigating the stability of the soil;
- (e) Surface industrial installations for the extraction of coal, petroleum, natural gas and ores, as well as bituminous shale.

#### 3. ENERGY INDUSTRY

- (a) Industrial installations for the production of electricity, steam and hot water (projects not included in Annex I);
- (b) Industrial installations for carrying gas, steam and hot water; transmission of electrical energy by overhead cables (projects not included in Annex I);
- (c) Surface storage of natural gas;
- (d) Underground storage of combustible gases;
- (e) Surface storage of fossil fuels;
- (f) Industrial briquetting of coal and lignite;
- (g) Installations for the processing and storage of radioactive waste (unless included in Annex I);
- (h) Installations for hydroelectric energy production;
- (i) Installations for the harnessing of wind power for energy production (wind farms);
- (j) Installations for the capture of CO<sub>2</sub> streams for the purposes of geological storage pursuant to Directive 2009/31/EC from installations not covered by Annex I to this Directive.

#### 4. PRODUCTION AND PROCESSING OF METALS

- (a) Installations for the production of pig iron or steel (primary or secondary fusion) including continuous casting;
- (b) Installations for the processing of ferrous metals:
  - (i) hot-rolling mills;
  - (ii) smitheries with hammers;
  - (iii) application of protective fused metal coats;
- (c) Ferrous metal foundries;
- (d) Installations for the smelting, including the alloyage, of non-ferrous metals, excluding precious metals, including recovered products (refining, foundry casting, etc.);
- (e) Installations for surface treatment of metals and plastic materials using an electrolytic or chemical process;
- (f) Manufacture and assembly of motor vehicles and manufacture of motor-vehicle engines;
- (g) Shipyards;
- (h) Installations for the construction and repair of aircraft;
- (i) Manufacture of railway equipment;
- (j) Swaging by explosives;
- (k) Installations for the roasting and sintering of metallic ores.

#### 5. MINERAL INDUSTRY

- (a) Coke ovens (dry coal distillation);
- (b) Installations for the manufacture of cement;
- (c) Installations for the production of asbestos and the manufacture of asbestos products (projects not included in Annex I);
- (d) Installations for the manufacture of glass including glass fibre;
- (e) Installations for smelting mineral substances including the production of mineral fibres;
- (f) Manufacture of ceramic products by burning, in particular roofing tiles, bricks, refractory bricks, tiles, stoneware or porcelain.

#### 6. CHEMICAL INDUSTRY (PROJECTS NOT INCLUDED IN ANNEX I)

- (a) Treatment of intermediate products and production of chemicals;
- (b) Production of pesticides and pharmaceutical products, paint and varnishes, elastomers and peroxides;
- (c) Storage facilities for petroleum, petrochemical and chemical products.

#### 7. FOOD INDUSTRY

- (a) Manufacture of vegetable and animal oils and fats;
- (b) Packing and canning of animal and vegetable products;
- (c) Manufacture of dairy products;
- (d) Brewing and malting;
- (e) Confectionery and syrup manufacture;

- (f) Installations for the slaughter of animals;
- (g) Industrial starch manufacturing installations;
- (h) Fish-meal and fish-oil factories;
- (i) Sugar factories.

#### 8. TEXTILE, LEATHER, WOOD AND PAPER INDUSTRIES

- (a) Industrial plants for the production of paper and board (projects not included in Annex I);
- (b) Plants for the pre-treatment (operations such as washing, bleaching, mercerisation) or dyeing of fibres or textiles;
- (c) Plants for the tanning of hides and skins;
- (d) Cellulose-processing and production installations.

#### 9. RUBBER INDUSTRY

Manufacture and treatment of elastomer-based products.

#### 10. INFRASTRUCTURE PROJECTS

- (a) Industrial estate development projects;
- (b) Urban development projects, including the construction of shopping centres and car parks;
- (c) Construction of railways and intermodal transshipment facilities, and of intermodal terminals (projects not included in Annex I);
- (d) Construction of airfields (projects not included in Annex I);
- (e) Construction of roads, harbours and port installations, including fishing harbours (projects not included in Annex I);
- (f) Inland-waterway construction not included in Annex I, canalisation and flood-relief works;
- (g) Dams and other installations designed to hold water or store it on a long-term basis (projects not included in Annex I);
- (h) Tramways, elevated and underground railways, suspended lines or similar lines of a particular type, used exclusively or mainly for passenger transport;
- (i) Oil and gas pipeline installations and pipelines for the transport of CO<sub>2</sub> streams for the purposes of geological storage (projects not included in Annex I);
- (j) Installations of long-distance aqueducts;
- (k) Coastal work to combat erosion and maritime works capable of altering the coast through the construction, for example, of dykes, moles, jetties and other sea defence works, excluding the maintenance and reconstruction of such works;
- (l) Groundwater abstraction and artificial groundwater recharge schemes not included in Annex I;
- (m) Works for the transfer of water resources between river basins not included in Annex I.

#### 11. OTHER PROJECTS

- (a) Permanent racing and test tracks for motorised vehicles;
- (b) Installations for the disposal of waste (projects not included in Annex I);
- (c) Waste-water treatment plants (projects not included in Annex I);
- (d) Sludge-deposition sites;

- (e) Storage of scrap iron, including scrap vehicles;
- (f) Test benches for engines, turbines or reactors;
- (g) Installations for the manufacture of artificial mineral fibres;
- (h) Installations for the recovery or destruction of explosive substances;
- (i) Knackers' yards.

## 12. TOURISM AND LEISURE

- (a) Ski runs, ski lifts and cable cars and associated developments;
- (b) Marinas;
- (c) Holiday villages and hotel complexes outside urban areas and associated developments;
- (d) Permanent campsites and caravan sites;
- (e) Theme parks.

13. (a) Any change or extension of projects listed in Annex I or this Annex, already authorised, executed or in the process of being executed, which may have significant adverse effects on the environment (change or extension not included in Annex I);
- (b) Projects in Annex I, undertaken exclusively or mainly for the development and testing of new methods or products and not used for more than two years.

## **ANNEX II.A**

### **INFORMATION REFERRED TO IN ARTICLE 4(4)**

#### **(INFORMATION TO BE PROVIDED BY THE DEVELOPER ON THE PROJECTS LISTED IN ANNEX II)**

**1. A description of the project, including in particular:**

**(a) a description of the physical characteristics of the whole project and, where relevant, of demolition works;**

**(b) a description of the location of the project, with particular regard to the environmental sensitivity of geographical areas likely to be affected.**

**2. A description of the aspects of the environment likely to be significantly affected by the project.**

**3. A description of any likely significant effects, to the extent of the information available on such effects, of the project on the environment resulting from:**

**(a) the expected residues and emissions and the production of waste, where relevant;**

**(b) the use of natural resources, in particular soil, land, water and biodiversity.**

**4. The criteria of Annex III shall be taken into account, where relevant, when compiling the information in accordance with points 1 to 3.**

## ANNEX III

### SELECTION CRITERIA REFERRED TO IN ARTICLE 4(3)

#### (CRITERIA TO DETERMINE WHETHER THE PROJECTS LISTED IN ANNEX II SHOULD BE SUBJECT TO AN ENVIRONMENTAL IMPACT ASSESSMENT)

##### 1. CHARACTERISTICS OF PROJECTS

The characteristics of projects must be considered, **with particular regard** to:

- (a) the size **and design** of the **whole** project;
- (b) the cumulation with other **existing and/or approved** projects;
- (c) the use of natural resources, **in particular land, soil, water and biodiversity**;
- (d) the production of waste;
- (e) pollution and nuisances;
- (f) the risk of **major accidents and/or disasters which are relevant to the project concerned, including those caused by climate change, in accordance with scientific knowledge**;
- (g) the risks to human health (for example due to water contamination or air pollution).**

##### 2. LOCATION OF PROJECTS

The environmental sensitivity of geographical areas likely to be affected by projects must be considered, **with particular regard** to:

- (a) the existing **and approved** land use;
- (b) the relative abundance, **availability**, quality and regenerative capacity of natural resources **(including soil, land, water and biodiversity)** in the area **and its underground**;
- (c) the absorption capacity of the natural environment, paying particular attention to the following areas:
  - (i) wetlands, **riparian areas, river mouths**;
  - (ii) coastal zones **and the marine environment**;
  - (iii) mountain and forest areas;
  - (iv) nature reserves and parks;
  - (v) areas classified or protected under **national** legislation; **Natura 2000 areas designated by Contracting Parties pursuant to Directive 92/43/EEC and Directive 2009/147/EC**;
  - (vi) areas in which **there has already been a failure to meet** the environmental quality standards laid down in Union legislation **and relevant to the project, or in which it is considered that there is such a failure**;
  - (vii) densely populated areas;
  - (viii) landscapes of historical, cultural or archaeological significance.

##### 3. TYPE AND CHARACTERISTICS OF THE POTENTIAL IMPACT

The **likely** significant effects of projects **on the environment** must be considered in relation to criteria set out in points 1 and 2 **of this Annex, with regard to the impact of the project on the**

**factors specified in Article 3(1), taking into account:**

- (a) the **magnitude and spatial** extent of the impact (**for example** geographical area and size of the **population likely to be affected**);
- (b) the **nature** of the impact;
- (c) the transboundary nature of the impact;
- (d) the **intensity** and complexity of the impact;
- (e) the probability of the impact;
- (f) the expected onset**, duration, frequency and reversibility of the impact;
- (g) the cumulation of the impact with the impact of other existing and/or approved projects;**
- (h) the possibility of effectively reducing the impact.**

## ANNEX IV

## INFORMATION REFERRED TO IN ARTICLE 5(1)

## (INFORMATION FOR THE ENVIRONMENTAL IMPACT ASSESSMENT REPORT)

1. A description of the project, including in particular:

**(a) a description of the location of the project;**

(b) a description of the physical characteristics of the whole project, **including, where relevant, requisite demolition works**, and the land-use requirements during the construction and operational phases;

(c) a description of the main characteristics of the **operational phase of the project (in particular any production process)**, for instance, **energy demand and energy used**, nature and quantity of the materials **and natural resources (including water, land, soil and biodiversity)** used;

(d) an estimate, by type and quantity, of expected residues and emissions (**such as water, air, soil and subsoil pollution, noise, vibration, light, heat, radiation**) **and quantities and types of waste produced during the construction and operation phases**.

2. **A description of the reasonable alternatives (for example in terms of project design, technology, location, size and scale)** studied by the developer, **which are relevant to the proposed project and its specific characteristics**, and an indication of the main reasons for selecting the chosen option, **including a comparison of** the environmental effects.

3. A description of the aspects of the **current state of the environment (baseline scenario)** and **an outline of the likely evolution thereof without implementation of the project as far as natural changes from the baseline scenario can be assessed with reasonable effort on the basis of the availability of environmental information and scientific knowledge**.

4. A description of the factors **specified in Article 3(1)** likely to be significantly affected by the project: population, **human health, biodiversity (for example fauna and flora), land (for example land take), soil (for example organic matter, erosion, compaction, sealing), water (for example hydromorphological changes, quantity and quality), air, climate (for example greenhouse gas emissions, impacts relevant to adaptation), material assets, cultural heritage, including** architectural and archaeological aspects, and landscape.

5. A description of the likely significant effects of the project on the environment resulting from, *inter alia*:

(a) the **construction and existence of the project, including, where relevant, demolition works;**

(b) the use of natural resources, **in particular land, soil, water and biodiversity, considering as far as possible the sustainable availability of these resources;**

(c) the emission of pollutants, **noise, vibration, light, heat and radiation**, the creation of nuisances, and **the disposal and recovery of waste;**

**(d) the risks to human health, cultural heritage or the environment (for example due to accidents or disasters);**

**(e) the cumulation of effects with other existing and/or approved projects, taking into**

account any existing environmental problems relating to areas of particular environmental importance likely to be affected or the use of natural resources;

(f) the impact of the project on climate (for example the nature and magnitude of greenhouse gas emissions) and the vulnerability of the project to climate change;

(g) the technologies and the substances used.

The description of the likely significant effects on the factors specified in Article 3(1) should cover the direct effects and any indirect, secondary, cumulative, transboundary, short-term, medium-term and long-term, permanent and temporary, positive and negative effects of the project. This description should take into account the environmental protection objectives established at Union or Member State level which are relevant to the project.

6. A description of the forecasting methods or evidence, used to identify and assess the significant effects on the environment, including details of difficulties (for example technical deficiencies or lack of knowledge) encountered compiling the required information and the main uncertainties involved.

7. A description of the measures envisaged to **avoid**, prevent, reduce or, if possible, offset any **identified** significant adverse effects on the environment **and, where appropriate, of any proposed monitoring arrangements (for example the preparation of a post-project analysis)**. That description should explain the extent, to which significant adverse effects on the environment are avoided, prevented, reduced or offset, and should cover both the construction and operational phases.

8. A description of the expected significant adverse effects of the project on the environment deriving from the vulnerability of the project to risks of major accidents and/or disasters which are relevant to the project concerned. Relevant information available and obtained through risk assessments pursuant to Union legislation such as Directive 2012/18/EU of the European Parliament and of the Council or Council Directive 2009/71/Euratom or relevant assessments carried out pursuant to national legislation may be used for this purpose provided that the requirements of this Directive are met. Where appropriate, this description should include measures envisaged to prevent or mitigate the significant adverse effects of such events on the environment and details of the preparedness for and proposed response to such emergencies.

9. A non-technical summary of the information provided under points 1 to 8.

10. A reference list detailing the sources used for the descriptions and assessments included in the report.

## ANNEX V

## DIRECTIVE (EU) 2016/802 of 11 May 2016 relating to a reduction in the sulphur content of certain liquid fuels (codification)

Incorporated and adapted by Ministerial Council Decision 2016/15/MC-EnC of 14 October 2016 on amending the Treaty establishing the Energy Community and adapting and implementing Directive (EU) 2016/802 of the European Parliament and of the Council and Commission Implementing Decision (EU) 2015/253.

Commission Implementing Decision (EU) 2015/253 laying down the rules concerning the sampling and reporting under Council Directive 1999/32/EC as regards the sulphur content of marine fuels, while being part of the Energy Community environmental *acquis*, is not displayed in the present Legal Framework.

*The adaptations made by Ministerial Council Decision 2016/15/MC-EnC are highlighted in **bold and blue**, the changes to Directive 1999/32/EC introduced by Directive (EU) 2016/802/EU are highlighted in **bold**.*

Whereas:

- (1) Council Directive 1999/32/EC has been substantially amended several times. In the interests of clarity and rationality, that Directive should be codified.
- (2) The environmental policy of the Union, as set out in the action programmes on the environment, and in particular in the Sixth Environment Action Programme adopted by Decision No 1600/2002/EC of the European Parliament and of the Council, and in the Seventh Environment Action Programme adopted by Decision No 1386/2013/EU of the European Parliament and of the Council, has as one of its objectives to achieve levels of air quality that do not give rise to significant negative impacts on, and risks to, human health and the environment.
- (3) Article 191(2) of the Treaty on the Functioning of the European Union (TFEU) provides that Union policy on the environment is to aim at a high level of protection, taking into account the diversity of situations in the various regions of the Union.
- (4) This Directive lays down the maximum permitted sulphur content of heavy fuel oil, gas oil, marine gas oil and marine diesel oil used in the Union.
- (5) Emissions from shipping due to the combustion of marine fuels with a high sulphur content contribute to air pollution in the form of sulphur dioxide and particulate matter, which harm human health and the environment and contribute to acid deposition. Without the measures set out in this Directive, emissions from shipping would soon have been higher than emissions from all land-based sources.
- (6) Acidification and atmospheric sulphur dioxide damage sensitive ecosystems, reduce biodiversity and amenity value and detrimentally affect crop production and the growth of forests. Acid rain falling in cities may cause significant damage to buildings and the architectural heritage. Sulphur dioxide pollution may also have a significant effect upon human health, particularly among those sectors of the population suffering from respiratory diseases.
- (7) Acidification is a transboundary phenomenon requiring Union as well as national or local solutions.
- (8) Emissions of sulphur dioxide contribute to the formation of particulate matter in the atmosphere.
- (9) Air pollution caused by ships at berth is a major concern for many harbour cities when it comes to their efforts to meet the Union's air quality limit values.
- (10) Member States should encourage the use of shore-side electricity, as the electricity for pres-

ent-day ships is usually provided by auxiliary engines.

(11) The Union and the individual Member States are Contracting Parties to the UN-ECE Convention of 13 November 1979 on Long-Range Transboundary Air Pollution. The second UN-ECE Protocol on transboundary pollution by sulphur dioxide stipulates that the Contracting Parties should reduce sulphur dioxide emissions in line with or beyond the 30% reduction specified in the first Protocol, and the second UN-ECE Protocol is based on the premise that critical loads and levels will continue to be exceeded in some sensitive areas. Further measures to reduce sulphur dioxide emissions will still be required. The Contracting Parties should therefore make further significant reductions in emissions of sulphur dioxide.

(12) Sulphur, which is naturally present in small quantities in oil and coal, has for decades been recognised as the dominant source of sulphur dioxide emissions, which are one of the main causes of 'acid rain' and one of the major causes of the air pollution experienced in many urban and industrial areas.

(13) Studies have shown that the benefits from reducing sulphur emissions by reductions in the sulphur content of fuels will often be considerably greater than the estimated costs to industry in this Directive. The technology exists and is well established for reducing the sulphur level of liquid fuels.

(14) In accordance with Article 193 TFEU, this Directive should not prevent any Member State from maintaining or introducing more stringent protective measures in order to encourage early implementation with respect to the maximum sulphur content of marine fuels, for instance using emission abatement methods outside SO<sub>x</sub> Emission Control Areas. Such measures are required to be compatible with the Treaties and are to be notified to the Commission.

(15) A Member State, before introducing new, more stringent protective measures, should notify the draft measures to the Commission in accordance with Directive (EU) 2015/1535 of the European Parliament and of the Council.

(16) The TFEU requires consideration to be given to the special characteristics of the outermost regions of the Union, namely the French overseas departments, the Azores, Madeira and the Canary Islands.

(17) With regard to the limit on the sulphur content of heavy fuel oil, it is appropriate to provide for derogations in Member States and regions where the environmental conditions so allow.

(18) With regard to the limit on the sulphur content of heavy fuel oil, it is also appropriate to provide for derogations for their use in combustion plants which comply with the emission limit values laid down in Directive 2001/80/EC of the European Parliament and of the Council, or in Annex V to Directive 2010/75/EU of the European Parliament and of the Council.

(19) For refinery combustion plants excluded from the scope of point (d) of Article 3(2) or point (c) of Article 3(3) of this Directive the emissions of sulphur dioxide averaged over such plants should not exceed the limits set out in Directive 2001/80/EC, or Annex V to Directive 2010/75/EU, or any future revision of those Directives. In the application of this Directive, Member States should bear in mind that substitution by fuels other than those referred to in Article 2 should not produce an increase in emissions of acidifying pollutants.

(20) In 2008, the International Maritime Organisation (IMO) adopted a resolution to amend Annex VI to the Protocol of 1997 to amend the International Convention for the Prevention of Pollution from Ships, 1973, as modified by the Protocol of 1978 relating thereto (MARPOL), containing regulations

for the prevention of air pollution from ships. The revised Annex VI to MARPOL entered into force on 1 July 2010.

(21) The revised Annex VI to MARPOL introduces, *inter alia*, stricter sulphur limits for marine fuel in SO<sub>x</sub> Emission Control Areas (1,00% as of 1 July 2010 and 0,10% as of 1 January 2015) as well as in sea areas outside SO<sub>x</sub> Emission Control Areas (3,50% as of 1 January 2012 and, in principle, 0,50% as of 1 January 2020). Most Member States are obliged, in accordance with their international commitments, to require ships to use fuel with a maximum sulphur content of 1,00% in SO<sub>x</sub> Emission Control Areas as of 1 July 2010. In order to ensure coherence with international law as well as to secure proper enforcement of new globally established sulphur standards in the Union, this Directive should be in line with the revised Annex VI to MARPOL. In order to ensure a minimum quality of fuel used by ships either for fuel-based or technology-based compliance, marine fuel the sulphur content of which exceeds the general standard of 3,50% by mass should not be allowed for use in the Union, except for fuels supplied to ships using emission abatement methods operating in closed mode.

(22) Amendments to Annex VI to MARPOL regarding SO<sub>x</sub> Emission Control Areas are possible under IMO procedures. In the event that further changes, including exemptions, are introduced with regard to the application of limits for SO<sub>x</sub> Emission Control Areas in Annex VI to MARPOL, the Commission should consider any such changes and, where appropriate, without delay make the necessary proposal in accordance with the TFEU to fully align this Directive with the IMO rules regarding SO<sub>x</sub> Emission Control Areas.

(23) The introduction of any new emission control areas should be subject to the IMO process under Annex VI to MARPOL and should be underpinned by a well-founded case based on environmental and economic grounds and supported by scientific data.

(24) In accordance with Regulation 18 of the revised Annex VI to MARPOL, Member States should endeavour to ensure the availability of marine fuels which comply with this Directive.

(25) In view of the global dimension of environmental politics and shipping emissions, ambitious emission standards should be set at a global level.

(26) The Union will continue to advocate more effective protection of areas sensitive to SO<sub>x</sub> emissions and a reduction in the normal limit value for bunker fuel oil at the IMO.

(27) Passenger ships operate mostly in ports or close to coastal areas and their impacts on human health and the environment are significant. In order to improve air quality around ports and coasts, those ships are required to use marine fuel with a maximum sulphur content of 1,50% until stricter sulphur standards apply to all ships in territorial seas, exclusive economic zones and pollution control zones of Member States.

(28) In order to facilitate the transition to new engine technologies with the potential for significant further emission reductions in the maritime sector, the Commission should further explore opportunities to enable and encourage the uptake of gas-powered engines in ships.

(29) Proper enforcement of the obligations with regard to the sulphur content of marine fuels is necessary in order to achieve the aims of this Directive. The experience from the implementation of Directive 1999/32/EC has shown that there is a need for a stronger monitoring and enforcement regime in order to ensure the proper implementation of this Directive. To that end, it is necessary that Member States ensure sufficiently frequent and accurate sampling of marine fuel placed on the market or used on board ship as well as regular verification of ships' logbooks and bunker delivery notes. It is also necessary for Member States to establish a system of effective, proportionate and

dissuasive penalties for non-compliance with the provisions of this Directive. In order to ensure more transparent information, it is also appropriate to provide that the register of local suppliers of marine fuel be made publicly available.

(30) Complying with the low sulphur limits for marine fuels, particularly in SO<sub>x</sub> Emission Control Areas, can result in a significant increase in the price of such fuels, at least in the short term, and can have a negative effect on the competitiveness of short sea shipping in comparison with other transport modes, as well as on the competitiveness of the industries in the countries bordering SO<sub>x</sub> Emission Control Areas. Suitable solutions are necessary in order to reduce compliance costs for the affected industries, such as allowing for alternative, more cost-effective methods of compliance than fuel-based compliance and providing support, where necessary. The Commission should, based, *inter alia*, on reports from Member States, closely monitor the impacts of the shipping sector's compliance with the new fuel quality standards, particularly with regard to possible modal shift from sea to land-based transport and should, if appropriate, propose proper measures to counteract such a trend.

(31) Limiting modal shift from sea to land-based transport is important given that an increasing share of goods being transported by road would in many cases run counter to the Union's climate change objectives and increase congestion.

(32) The costs of the new requirements to reduce sulphur dioxide emissions could result in modal shift from sea to land-based transport and could have negative effects on the competitiveness of the industries. The Commission should make full use of instruments such as Marco Polo and the trans-European transport network to provide targeted assistance so as to minimise the risk of modal shift. Member States may consider it necessary to provide support to operators affected by this Directive in accordance with the applicable State aid rules.

(33) In accordance with existing guidelines on State aid for environmental protection, and without prejudice to future changes thereto, Member States may provide State aid in favour of operators affected by this Directive, including aid for retrofitting operations of existing vessels, if such aid measures are deemed to be compatible with the internal market in accordance with Articles 107 and 108 TFEU, in particular in light of the applicable guidelines on State aid for environmental protection. In this context, the Commission may take into account that the use of some emission abatement methods go beyond the requirements of this Directive by reducing not only the sulphur dioxide emissions but also other emissions.

(34) Access to emission abatement methods should be facilitated. Those methods can provide emission reductions at least equivalent to, or even greater than, those achievable using low sulphur fuel, provided that they have no significant negative impacts on the environment, such as marine ecosystems, and that they are developed subject to appropriate approval and control mechanisms. The already known alternative methods, such as the use of on-board exhaust gas cleaning systems, the mixture of fuel and liquefied natural gas or the use of biofuels should be recognised in the Union. It is important to promote the testing and development of new emission abatement methods in order, among other reasons, to limit modal shift from sea to land-based transport.

(35) Emission abatement methods hold the potential for significant emission reductions. The Commission should therefore promote the testing and development of such technologies, *inter alia*, by considering the establishment of a co-financed joint programme with industry, based on principles from similar programmes, such as the Clean Sky Programme.

(36) The Commission, in cooperation with Member States and stakeholders, should further develop measures identified in the Commission's Staff Working Paper of 16 September 2011 entitled 'Pollutant emission reduction from maritime transport and the sustainable waterborne transport toolbox'.

(37) In the case of a disruption in the supply of crude oil, petroleum products or other hydrocarbons, the Commission may authorise the application of a higher limit within a Member State's territory.

(38) Member States should establish the appropriate mechanisms for monitoring compliance with the provisions of this Directive. Reports on the sulphur content of liquid fuels should be submitted to the Commission.

(39) This Directive should contain detailed indications as regards the content and the format of the report to ensure harmonised reporting.

(40) The power to adopt acts in accordance with Article 290 TFEU should be delegated to the Commission in respect of the amendment of the equivalent emission values for, and the criteria for the use of, emission abatement methods laid down in Annexes I and II to this Directive, in order to adapt them to scientific and technical progress in such a way as to ensure strict consistency with the relevant instruments of the IMO, and in respect of the amendment of points (a) to (e) and (p) of Article 2, point (b)(i) of Article 13(2) and Article 13(3) of this Directive in order to adapt those provisions to scientific and technical progress. It is of particular importance that the Commission carry out appropriate consultations during its preparatory work, including at expert level. The Commission, when preparing and drawing up delegated acts, should ensure a simultaneous, timely and appropriate transmission of relevant documents to the European Parliament and to the Council.

(41) In order to ensure uniform conditions for the implementation of this Directive, implementing powers should be conferred on the Commission. Those powers should be exercised in accordance with Regulation (EU) No 182/2011 of the European Parliament and of the Council.

(42) It is appropriate for the Committee on Safe Seas and the Prevention of Pollution from Ships (COSS) established by Regulation (EC) No 2099/2002 of the European Parliament and of the Council to assist the Commission in the approval of the emission abatement methods which are not covered by Council Directive 96/98/EC.

(43) Effective, proportionate and dissuasive penalties are important for the implementation of this Directive. Member States should include in those penalties fines calculated in such a way as to ensure that the fines at least deprive those responsible of the economic benefits derived from their infringement and that those fines gradually increase for repeated infringements. Member States should notify the provisions on penalties to the Commission.

(44) This Directive should be without prejudice to the obligations of the Member States relating to the time limits for the transposition into national law of the Directives set out in Annex III, Part B.

## **Article 1**

### **Purpose and scope**

1. The purpose of this Directive is to reduce the emissions of sulphur dioxide resulting from the combustion of certain types of liquid fuels and thereby to reduce the harmful effects of such emissions on man and the environment.
2. Reductions in emissions of sulphur dioxide resulting from the combustion of certain petrole-

um-derived liquid fuels shall be achieved by imposing limits on the sulphur content of such fuels as a condition for their use within **Contracting Parties'** territory, territorial seas and exclusive economic zones or pollution control zones.

The limitations on the sulphur content of certain petroleum-derived liquid fuels as laid down in this Directive shall not, however, apply to:

- (a) fuels intended for the purposes of research and testing;
- (b) fuels intended for processing prior to final combustion;
- (c) fuels to be processed in the refining industry;
- (d) <...><sup>1</sup>
- (e) fuels used by warships and other vessels on military service. However, each **Contracting Party** shall endeavour to ensure, by the adoption of appropriate measures not impairing the operations or operational capability of such ships, that the ships act in a manner consistent, so far as is reasonable and practical, with this Directive;
- (f) any use of fuels in a vessel necessary for the specific purpose of securing the safety of a ship or saving life at sea;
- (g) any use of fuels in a ship necessitated by damage sustained by it or its equipment, provided that all reasonable measures are taken after the occurrence of the damage to prevent or minimise excess emissions and that measures are taken as soon as possible to repair the damage. This shall not apply if the owner or master acted either with intent to cause damage, or recklessly;
- (h) without prejudice to Article 5, fuels used on board vessels employing emission abatement methods in accordance with Articles 8 and 10.

## **Article 2**

### **Definitions**

For the purpose of this Directive **the following definitions shall apply:**

- (a) 'heavy fuel oil' means:
  - (i) any petroleum-derived liquid fuel, excluding marine fuel, falling within CN codes 2710 19 51 to 2710 19 68, 2710 20 31, 2710 20 35 or 2710 20 39; or
  - (ii) any petroleum-derived liquid fuel, other than gas oil as defined in point (b) and other than **marine fuels as defined in points (c), (d) and (e)**, which, by reason of its distillation limits, falls within the category of heavy oils intended for use as fuel and of which less than 65% by volume (including losses) distils at 250 °C by the ASTM D86 method. If the distillation cannot be determined by the ASTM D86 method, the petroleum product is likewise categorised as a heavy fuel oil;
- (b) 'gas oil' means:
  - (i) any petroleum-derived liquid fuel, excluding marine fuel, falling within CN codes 2710 19 25, 2710 19 29, 2710 19 47, 2710 19 48, 2710 20 17 or 2710 20 19; or

<sup>1</sup> According to point (a) of Article 2(1) of Decision 2016/15/MC-EnC, point (d) of Article 1(2) shall not be applicable in the Energy Community.

(ii) any petroleum-derived liquid fuel, excluding marine fuel, of which less than 65% by volume (including losses) distils at 250 °C and of which at least 85% by volume (including losses) distils at 350 °C by the ASTM D86 method. Diesel fuels as defined in point 2 of Article 2 of Directive 98/70/EC of the European Parliament and of the Council are excluded from this definition. Fuels used in non-road mobile machinery and agricultural tractors are also excluded from this definition;

**(c) 'marine fuel' means any petroleum-derived liquid fuel intended for use or in use on board a vessel, including those fuels defined in ISO 8217. It includes any petroleum-derived liquid fuel in use on board inland waterway vessels or recreational craft, as defined respectively in Article 2 of Directive 97/68/EC of the European Parliament and of the Council and Article 1(3) of Directive 94/25/EC of the European Parliament and of the Council, when such vessels are at sea;**

**(d) 'marine diesel oil' means any marine fuel as defined for DMB grade in Table I of ISO 8217 with the exception of the reference to the sulphur content;**

**(e) 'marine gas oil' means any marine fuel as defined for DMX, DMA and DMZ grades in Table I of ISO 8217 with the exception of the reference to the sulphur content;**

**(f) 'MARPOL' means the International Convention for the Prevention of Pollution from Ships, 1973, as modified by the Protocol of 1978 relating thereto;**

**(g) 'Annex VI to MARPOL' means the annex, entitled 'Regulations for the Prevention of Air Pollution from Ships', which the Protocol of 1997 added to MARPOL;**

**(h) 'SO<sub>x</sub> Emission Control Areas' means sea areas defined as such by the International Maritime Organisation (IMO) under Annex VI to MARPOL;**

**(i) 'passenger ships' means ships that carry more than 12 passengers, where a passenger is every person other than:**

- (i) the master and the members of the crew or other person employed or engaged in any capacity on board a ship on the business of that ship; and
- (ii) a child under 1 year of age;

**(j) 'regular services' means a series of passenger ship crossings operated so as to serve traffic between the same two or more ports, or a series of voyages from and to the same port without intermediate calls, either:**

- (i) according to a published timetable; or

**(ii) with crossings so regular or frequent that they constitute a recognisable schedule;**

**(k) 'warship' means a ship belonging to the armed forces of a State, bearing the external marks distinguishing such ships of its nationality, under the command of an officer duly commissioned by the government of the State and whose name appears in the appropriate service list or its equivalent, and manned by a crew which is under regular armed forces discipline;**

**(l) 'ships at berth' means ships which are securely moored or anchored in a **Community** port while they are loading, unloading or hotelling, including the time spent when not engaged in cargo operations;**

**(m) 'placing on the market' means supplying or making available to third persons, against**

payment or free of charge, anywhere within **Contracting Parties'** jurisdictions, marine fuels for on-board combustion. It excludes supplying or making available marine fuels for export in ships' cargo tanks;

(n) <...><sup>2</sup>

(o) 'emission abatement method' means any fitting, material, appliance or apparatus to be fitted in a ship or other procedure, alternative fuel, or compliance method, used as an alternative to low sulphur marine fuel meeting the requirements set out in this Directive, that is verifiable, quantifiable and enforceable;

(p) 'ASTM method' means the methods laid down by the American Society for Testing and Materials in the 1976 edition of standard definitions and specifications for petroleum and lubricating products;

(q) 'combustion plant' means any technical apparatus in which fuels are oxidised in order to use the heat generated.

### Article 3

#### Maximum sulphur content of heavy fuel oil

1. **Contracting Parties** shall <...> ensure that <...> heavy fuel oils are not used within their territory if their sulphur content exceeds 1,00% by mass.

2. <...> **Until 31 December 2027**, subject to appropriate monitoring of emissions by competent authorities, paragraph 1 shall not apply to heavy fuel oils used:

(a) in combustion plants which fall within the scope of **Directive 2001/80/EC**, which are **subject to Article 4(1) or (2) or point (a) of Article 4(3) of that Directive** and which comply with the emission limits for sulphur dioxide for such plants as set out **in that Directive**;

**(b) in combustion plants which fall within the scope of Directive 2001/80/EC, which are subject to point (b) of Article 4(3) and Article 4(6) of that Directive and the monthly average sulphur dioxide emissions of which do not exceed 1 700 mg/Nm<sup>3</sup> at an oxygen content in the flue gas of 3% by volume on a dry basis;**

(c) in combustion plants which do not fall under points (a) or (b), and the **monthly average** sulphur dioxide emissions of which do not exceed 1 700 mg/Nm<sup>3</sup> at an oxygen content in the flue gas of 3% by volume on a dry basis;

(d) for combustion in refineries, where the monthly average of emissions of sulphur dioxide averaged over all combustion plants in the refinery, irrespective of the type of fuel or fuel combination used, but excluding plants which fall under points (a) and (b), **gas turbines and gas engines**, does not exceed 1 700 mg/Nm<sup>3</sup> at an oxygen content in the flue gas of 3% by volume on a dry basis.

3. **As from 1 January 2028**, subject to appropriate monitoring of emissions by competent authorities, paragraph 1 shall not apply to heavy fuel oils used:

**(a) in combustion plants which fall within the scope of Chapter III of Directive 2010/75/EU, and which comply with the emission limits for sulphur dioxide for such plants as set out in Annex V to that Directive or, where those emission limit values are not applicable in accordance with that Directive, for which the monthly average sulphur dioxide emissions does**

<sup>2</sup> Not applicable in accordance with Article 2(1)(e) of Decision 2016/15/MC-EnC.

**not exceed 1 700 mg/Nm<sup>3</sup>** at an oxygen content in the flue gas of 3% by volume on a dry basis;  
**(b) in combustion plants which do not fall under point (a), and the monthly average sulphur dioxide emissions of which does not exceed 1 700 mg/Nm<sup>3</sup>** at an oxygen content in the flue gas of 3% by volume on a dry basis;

**(c) for combustion in refineries, where the monthly average of emissions of sulphur dioxide averaged over all combustion plants in the refinery, irrespective of the type of fuel or fuel combination used, but excluding plants falling under point (a), gas turbines and gas engines, does not exceed 1 700 mg/Nm<sup>3</sup>** at an oxygen content in the flue gas of 3% by volume on a dry basis. **Contracting Parties** shall take the necessary measures to ensure that no combustion plant using heavy fuel oil with a sulphur concentration greater than that referred to in paragraph 1 is operated without a permit issued by a competent authority, which specifies the emission limits.

4. <...>

5. If a **Contracting Party** avails itself of the possibilities referred to in paragraph 2, it shall, at least 12 months beforehand, inform the **Secretariat** and the public. The **Secretariat** shall be given sufficient information to assess whether the criteria mentioned in paragraph 2 are met. The **Secretariat** shall inform the other **Contracting Parties**.

Within six months of the date on which it receives the information from the **Contracting Party**, the **Secretariat** shall examine the measures envisaged and, in accordance with the procedure set out in Article 9, take a decision which it shall communicate to the **Contracting Parties**. This decision shall be reviewed every eight years on the basis of information to be provided to the **Secretariat** by the **Contracting Parties** concerned in accordance with the procedure set out in Article 9.<sup>3</sup>

#### **Article 4**

##### **Maximum sulphur content in gas oil**

1. **Contracting Parties** shall <...> ensure that gas oils <...> are not used within their territory <...> if their sulphur content exceeds 0,10% by mass.

2. <...>

3. Provided that the air quality standards for sulphur dioxide laid down in Directive 80/779/EEC or in any Community legislation which repeals and replaces these standards and other relevant Community provisions are respected and the emissions do not contribute to critical loads being exceeded in any **Contracting Party**, a **Contracting Party** may authorise gas oil with a sulphur content between 0,10 and 0,20% by mass to be used in part or the whole of its territory. Such authorisation shall apply only while emissions from a **Contracting Party** do not contribute to critical loads being exceeded in any **Contracting Party** and shall not extend beyond 1 January 2013.

4. If a **Contracting Party** avails itself of the possibilities referred to in paragraph 3, it shall, at least 12 months beforehand, inform the **Secretariat** and the public. The **Secretariat** shall be given sufficient information to assess whether the criteria mentioned in paragraph 3 are met. The **Secretariat** shall inform the other **Contracting Parties**.

Within six months of the date on which it receives the information from the **Contracting Party**, the

<sup>3</sup> According to Article 4(1) of Decision 2016/15/MC-EnC, this provision is applicable until 30 June 2018 in the Energy Community.

**Secretariat** shall examine the measures envisaged and, in accordance with the procedure set out in Article 9, take a decision which it shall communicate to the **Contracting Parties**.<sup>4</sup>

### Article 5

#### Maximum sulphur content in marine fuel

**Contracting Parties** shall ensure that marine fuels are not used within their territory if their sulphur content exceeds 3,50% by mass, except for fuels supplied to ships using emission abatement methods subject to Article 8 operating in closed mode.

### Article 6

Maximum sulphur content of marine fuels used in territorial seas, exclusive economic zones and pollution control zones of **Contracting Parties**, including SO<sub>x</sub> Emission Control Areas, and by passenger ships operating on regular services to or from **Community** ports

1. **Contracting Parties** shall take all necessary measures to ensure that marine fuels are not used in the areas of their territorial seas, exclusive economic zones and pollution control zones if the sulphur content of those fuels by mass exceeds:

(a) 3,50% as from 1 January 2018, without prejudice to commitments of certain **Contracting Parties** under Annex VI to the International Convention for the Prevention of Pollution from Ships (MARPOL)<sup>5</sup>;

(b) 0,50% as from 1 January 2020. This paragraph shall apply to all vessels of all flags, including vessels whose journey began outside of the **Community**, without prejudice to paragraphs 2 and 5 of this Article and Article 7.

2. **Contracting Parties** shall take all necessary measures to ensure that marine fuels are not used in the areas of their territorial seas, exclusive economic zones and pollution control zones falling within SO<sub>x</sub> Emission Control Areas if the sulphur content of those fuels by mass exceeds:

(a) <...>;<sup>6</sup>

(b) 0,10% as from 1 January 2015, in accordance with Article 6(3).<sup>7</sup>

This paragraph shall apply to all vessels of all flags, including vessels whose journey began outside the **Community**.

The **Secretariat** shall have due regard to any future changes to the requirements pursuant to Annex VI to MARPOL applicable within SO<sub>x</sub> Emission Control Areas, and, where appropriate, without undue delay make any relevant proposals with a view to amending this

<sup>4</sup> According to Article 4(1) of Decision 2016/15/MC-EnC, this provision is applicable until 30 June 2018 in the Energy Community.

<sup>5</sup> The text displayed here corresponds to point (d) of Article 2(1) of Decision 2016/15/MC-EnC.

<sup>6</sup> Not applicable in accordance with Article 2(1)(a) of Decision 2016/15/MC-EnC.

<sup>7</sup> The text displayed here corresponds to point (f) of Article 2(1) of Decision 2016/15/MC-EnC.

Directive accordingly.

3. The application date for paragraph 2 for any new sea areas, including ports, designated by the IMO as SO<sub>x</sub> Emission Control Areas in accordance with Regulation 14(3)(b) of Annex VI to MARPOL shall be 12 months after the date of entry into force of the designation.

4. **Contracting Parties** shall be responsible for the enforcement of paragraph 2 at least in respect of:

- vessels flying their flag, and
- in the case of **Contracting Parties** bordering SO<sub>x</sub> Emission Control Areas, vessels of all flags while in their ports.

**Contracting Parties** may also take additional enforcement action in respect of other vessels in accordance with international maritime law.

5. **Contracting Parties** shall take all necessary measures to ensure that marine fuels are not used in their territorial seas, exclusive economic zones and pollution control zones falling outside SO<sub>x</sub> Emission Control Areas by passenger ships operating on regular services to or from any **Community** port if the sulphur content of those fuels exceeds 1,50% by mass until 1 January 2020.

**Contracting Parties** shall be responsible for the enforcement of this requirement at least in respect of vessels flying their flag and vessels of all flags while in their ports.

6. **Contracting Parties** shall require the correct completion of ships' logbooks, including fuel-changeover operations.

7. **Contracting Parties** shall endeavour to ensure the availability of marine fuels which comply with this Directive and inform the **Secretariat** of the availability of such marine fuels in its ports and terminals.

8. If a ship is found by a **Contracting Party** not to be in compliance with the standards for marine fuels which comply with this Directive, the competent authority of the **Contracting Party** is entitled to require the ship to:

- (a) present a record of the actions taken to attempt to achieve compliance; and
- (b) provide evidence that it attempted to purchase marine fuel which complies with this Directive in accordance with its voyage plan and, if it was not made available where planned, that attempts were made to locate alternative sources for such marine fuel and that, despite best efforts to obtain marine fuel which complies with this Directive, no such marine fuel was made available for purchase.

The ship shall not be required to deviate from its intended voyage or to delay unduly the voyage in order to achieve compliance.

If a ship provides the information referred to in the first subparagraph, the **Contracting Party** concerned shall take into account all relevant circumstances and the evidence presented to determine the appropriate action to take, including not taking control measures.

A ship shall notify its flag State and the competent authority of the relevant port of destination when it cannot purchase marine fuel which complies with this Directive.

A port State shall notify the **Secretariat** when a ship has presented evidence of the non-availability of marine fuels which comply with this Directive.

9. **Contracting Parties** shall, in accordance with Regulation 18 of Annex VI to MARPOL:

- (a) maintain a publicly available register of local suppliers of marine fuel;
- (b) ensure that the sulphur content of all marine fuels sold in their territory is documented by the supplier on a bunker delivery note, accompanied by a sealed sample signed by the representative of the receiving ship;
- (c) take action against marine fuel suppliers that have been found to deliver fuel that does not comply with the specification stated on the bunker delivery note;
- (d) ensure that remedial action is taken to bring any non-compliant marine fuel discovered into compliance.

10. **Contracting Parties** shall ensure that marine diesel oils are not placed on the market in their territory if the sulphur content of those marine diesel oils exceeds 1,50% by mass.

#### *Article 7*

Maximum sulphur content of marine fuels used by ships at berth in **Community** ports

1. **Contracting Parties** shall take all necessary measures to ensure that ships at berth in **Community** ports do not use marine fuels with a sulphur content exceeding 0,10% by mass, allowing sufficient time for the crew to complete any necessary fuel-changeover operation as soon as possible after arrival at berth and as late as possible before departure.

**Contracting Parties** shall require the time of any fuel-changeover operation to be recorded in ships' logbooks.

2. Paragraph 1 shall not apply:

- (a) whenever, according to published timetables, ships are due to be at berth for less than two hours;
- (b) to ships which switch off all engines and use shore-side electricity while at berth in ports.

3. **Contracting Parties** shall ensure that marine gas oils are not placed on the market in their territory if the sulphur content of those marine gas oils exceeds 0,10% by mass.

#### *Article 8*

Emission abatement methods

1. **Contracting Parties** shall allow the use of emission abatement methods by ships of all flags in their ports, territorial seas, exclusive economic zones and pollution control zones, as an alternative to using marine fuels that meet the requirements of Articles 6 and 7, subject to paragraphs 2 and 4 of this Article.

2. Ships using the emission abatement methods referred to in paragraph 1 shall continuously achieve reductions of sulphur dioxide emissions that are at least equivalent to the reductions that would be achieved by using marine fuels that meet the requirements of Articles 6 and 7. Equivalent emission values shall be determined in accordance with Annex I.

3. **Contracting Parties** shall, as an alternative solution for reducing emissions, encourage the use of onshore power supply systems by docked vessels.
4. The emission abatement methods referred to in paragraph 1 shall comply with the criteria specified in the instruments referred to in Annex II.
5. <...><sup>8</sup>

#### *Article 9*

#### Approval of emission abatement methods for use on board ships flying the flag of a **Contracting Party**

1. Emission abatement methods falling within the scope of Directive 96/98/EC shall be approved in accordance with that Directive.
2. Emission abatement methods not covered by paragraph 1 of this Article shall be approved in accordance with the procedure referred to in Article 3(2) of Regulation (EC) No 2099/2002, taking into account:
  - (a) guidelines developed by the IMO;
  - (b) the results of any trials conducted under Article 10;
  - (c) effects on the environment, including achievable emission reductions, and impacts on ecosystems in enclosed ports, harbours and estuaries; and
  - (d) the feasibility of monitoring and verification.

#### *Article 10*

#### Trials of new emission abatement methods

**Contracting Parties** may, in cooperation with other **Contracting Parties**, as appropriate, approve trials of ship emission abatement methods on vessels flying their flag, or in sea areas within their jurisdiction. During those trials, the use of marine fuels meeting the requirements of Articles 6 and 7 shall not be mandatory, provided that all of the following conditions are fulfilled:

- (a) the **Secretariat** and any port State concerned are notified in writing at least 6 months before trials begin;
- (b) permits for trials do not exceed 18 months in duration;
- (c) all ships involved install tamper-proof equipment for the continuous monitoring of funnel gas emissions and use it throughout the trial period;
- (d) all ships involved achieve emission reductions which are at least equivalent to those which would be achieved through the sulphur limits for fuels specified in this Directive;
- (e) there are proper waste management systems in place for any waste generated by the emission abatement methods throughout the trial period;

<sup>8</sup> Not applicable in accordance with Article 2(1)(g) of Decision 2016/15/MC-EnC.

(f) there is an assessment of impacts on the marine environment, particularly ecosystems in enclosed ports, harbours and estuaries throughout the trial period; and

(g) full results are provided to the **Secretariat** and are made publicly available within 6 months of the end of the trials.

### *Article 11*

#### Financial measures

**Contracting Parties** may adopt financial measures in favour of operators affected by this Directive where such financial measures are in accordance with State aid rules applicable and to be adopted in this area.

### *Article 12*

#### Change in the supply of fuels

If, as a result of a sudden change in the supply of crude oil, petroleum products or other hydrocarbons, it becomes difficult for a **Contracting Party** to apply the limits on the maximum sulphur content referred to in Articles 3 and 4, that **Contracting Party** shall inform the **Secretariat** thereof. The **Secretariat** may authorise a higher limit to be applicable within the territory of that **Contracting Party** for a period not exceeding 6 months. It shall notify the **Ministerial Council** and the **Contracting Parties of its decision**. Any **Contracting Party** may refer that decision to the **Ministerial Council** within 1 month. The **Ministerial Council**, acting by a qualified majority, may adopt a different decision within 2 months.

### *Article 13*

#### Sampling and analysis

1. **Contracting Parties** shall take all necessary measures to check by sampling that the sulphur content of fuels used complies with Articles 3 to 7. The sampling shall commence <...> on the date on which the relevant limit for maximum sulphur content in the fuel comes into force. It shall be carried out **periodically** with sufficient frequency and **quantities such that** the samples are representative of the fuel examined, **and in the case of marine fuel, of the fuel being used by vessels while in relevant sea areas and ports. The samples shall be analysed without undue delay.**

2. The following means of sampling, analysis and inspection of marine fuel shall be used:

(a) inspection of ships' logbooks and bunker delivery notes; and

(b) as appropriate, the following means of sampling and analysis:

(i) sampling of the marine fuel for on-board combustion while being delivered to ships, in accordance with the Guidelines for the sampling of fuel oil for determination of compliance with the revised Annex VI to MARPOL, adopted on 17 July 2009 by Resolution 182(59) of the Marine Environment Protection Committee (MEPC) of the IMO, and

analysis of its sulphur content; or

(ii) sampling and analysis of the sulphur content of marine fuel for on-board combustion contained in tanks, where technically and economically feasible, and in sealed bunker samples on board ships.

3. The reference method adopted for determining the sulphur content shall be ISO method 8754 (2003) or EN ISO 14596:2007.

**In order to determine whether marine fuel delivered to, and used on board, ships is compliant with the sulphur limits required by Articles 4 to 7, the fuel verification procedure set out in Appendix VI to Annex VI to MARPOL shall be used.**

4. <...><sup>9</sup>

#### Article 14

##### Reporting and review

1. Each year by 30 June, **Contracting Parties** shall, on the basis of the results of the sampling, analysis and inspections carried out in accordance with Article 13, submit a report to the **Secretariat** on the compliance with the sulphur standards set out in this Directive for the preceding year.

On the basis of the reports received in accordance with the first subparagraph of this paragraph and the notifications regarding the non-availability of marine fuel which complies with this Directive submitted by **Contracting Parties** in accordance with the fifth subparagraph of Article 6(8), the **Secretariat** shall, within 12 months of the date referred to in the first subparagraph of this paragraph, draw up and publish a report on the implementation of this Directive. The **Secretariat** shall evaluate the need for further strengthening of the relevant provisions of this Directive and make any appropriate legislative proposals to that effect.

2. By 31 December 2013, the **Secretariat** shall submit a report to the European Parliament and to the **Ministerial Council** which shall be accompanied, if appropriate, by legislative proposals. The **Secretariat** shall consider in its report the potential for reducing air pollution taking into account, *inter alia*: annual reports submitted in accordance with paragraphs 1 and 3; observed air quality and acidification; fuel costs; potential economic impact and observed modal shift; and progress in reducing emissions from ships.

3. <...><sup>10</sup>

<sup>9</sup> Not applicable in accordance with Article 2(1)(g) of Decision 2016/15/MC-EnC.

<sup>10</sup> *ibid.*

**Article 15****Adaptation to scientific and technical progress**

The **Secretariat** shall be empowered to adopt delegated acts in accordance with Article 16 concerning the adaptations of points (a) to (e) and (p) of Article 2, point (b)(i) of Article 13(2) and Article 13(3) to scientific and technical progress. Such adaptations shall not result in any direct changes to the scope of this Directive or to sulphur limits for fuels specified in this Directive.

**Article 16****Exercise of the delegation**

&lt;...&gt;

**Article 17****Committee procedure**

&lt;...&gt;

**Article 18****Penalties**

**Contracting Parties** shall determine the penalties applicable to breaches of the national provisions adopted pursuant to this Directive.

The penalties determined shall be effective, proportionate and dissuasive and may include fines calculated in such a way as to ensure that the fines at least deprive those responsible of the economic benefits derived from the infringement of the national provisions as referred to in the first paragraph and that those fines gradually increase for repeated infringements.

**Article 19****Repeal**

**1. Contracting Parties shall bring into force the laws, regulations and administrative provisions necessary to comply with Article 1(2), Article 2, Article 3(3), Articles 5 to 11, 13, 14 and 15 of Directive (EU) 2016/802 by 30 June 2018 at the latest and with Decision (EU) 2015/253 by 1 January 2018 at the latest.<sup>11</sup> They shall forthwith communicate to the Energy Community Secretariat the text of those provisions.**

**When Contracting Parties adopt those provisions, they shall contain a reference to this Decision, Directive (EU) 2016/802 and Decision (EU) 2015/253 or be accompanied by such a ref-**

<sup>11</sup> Directive 1999/32/EC was applicable in the Energy Community until 30 June 2018, Contracting Parties were obliged to bring into force the laws, regulations and administrative provisions necessary to comply with that Directive until 31 December 2011 (in accordance with their Accession Protocols, 1 January 2012 for Ukraine, 31 December 2014 for Moldova and 1 September 2021 for Georgia).

erence on the occasion of their official publication. They shall also include a statement that references in existing laws, regulations and administrative provisions to Directive 93/12/EEC shall be construed as references to Directive (EU) 2016/802. Contracting Parties shall determine how such reference is to be made and how that statement is to be formulated.

2. Contracting Parties shall communicate to the Energy Community Secretariat the text of the main provisions of national law which they adopt in the field covered by this Decision, Directive (EU) 2016/802 and Decision (EU) 2015/253.<sup>12</sup>

#### ***Article 20***

#### **Entry into force**

This Decision shall enter into force on the date of its adoption.<sup>13</sup>

#### ***Article 21***

#### **Addressees**

This Decision is addressed to the Contracting Parties of the Treaty establishing the Energy Community.<sup>14</sup>

<sup>12</sup> The text displayed here corresponds to Article 4 of Decision 2016/15/MC-EnC.

<sup>13</sup> The text displayed here corresponds to Article 5 of Decision 2016/15/MC-EnC.

<sup>14</sup> The text displayed here corresponds to Article 6 of Decision 2016/15/MC-EnC.

## ANNEX I

## EQUIVALENT EMISSION VALUES FOR EMISSION ABATEMENT METHODS AS REFERRED TO IN ARTICLE 8(2)

Marine fuel sulphur limits referred to in Articles 6 and 7 of this Directive and Regulations 14.1 and 14.4 of Annex VI to MARPOL and corresponding emission values referred to in Article 8(2):

Marine fuel Sulphur Content (% m/m)	Ratio Emission SO <sub>2</sub> (ppm)/CO <sub>2</sub> (% v/v)
3,50	151,7
1,50	65,0
1,00	43,3
0,50	21,7
0,10	4,3

Note:

— the use of the Ratio Emissions limits is only applicable when using petroleum-based distillate or residual fuel oils,

— in justified cases where the CO<sub>2</sub> concentration is reduced by the exhaust gas cleaning (EGC) unit, the CO<sub>2</sub> concentration may be measured at the EGC unit inlet, provided that the correctness of such a methodology can be clearly demonstrated.

## ANNEX II

## CRITERIA FOR THE USE OF EMISSION ABATEMENT METHODS AS REFERRED TO IN ARTICLE 8(4)

The emission abatement methods referred to in Article 8 shall comply at least with the criteria specified in the following instruments, as applicable:

Emission abatement method	Criteria for use
Mixture of marine fuel and boil-off gas	Commission Decision 2010/769/EU <sup>1</sup> .
Exhaust gas cleaning systems	Resolution MEPC.184(59) adopted on 17 July 2009 'Washwater resulting from exhaust gas cleaning systems which make use of chemicals, additives, preparations and relevant chemicals created <i>in situ</i> , referred to in point 10.1.6.1 of Resolution MEPC.184(59), shall not be discharged into the sea, including enclosed ports, harbours and estuaries, unless it is demonstrated by the ship operator that such washwater discharge has no significant negative impacts on and does not pose risks to human health and the environment. If the chemical used is caustic soda it is sufficient that the washwater meets the criteria set out in Resolution MEPC.184(59) and its pH does not exceed 8,0.
Biofuels	Use of biofuels as defined in Directive 2009/28/EC of the European Parliament and of the Council <sup>2</sup> that comply with the relevant CEN and ISO standards.  The mixtures of biofuels and marine fuels shall comply with the sulphur standards set out in Article 5, Article 6(1), (2) and (5) and Article 7 of this Directive.

<sup>1</sup> Commission Decision 2010/769/EU of 13 December 2010 on the establishment of criteria for the use by liquefied natural gas carriers of technological methods as an alternative to using low sulphur marine fuels meeting the requirements of Article 4b of Council Directive 1999/32/EC relating to a reduction in the sulphur content of certain liquid fuels as amended by Directive 2005/33/EC of the European Parliament and of the Council on the sulphur content of marine fuels (OJ L328, 14.12.2010, p. 15).

<sup>2</sup> Directive 2009/28/EC of the European Parliament and of the Council of 23 April 2009 on the promotion of the use of energy from renewable sources and amending and subsequently repealing Directives 2001/77/EC and 2003/30/EC (OJ L140, 5.6.2009, p. 16).

## DIRECTIVE 2001/80/EC of 23 October 2001 on the limitation of emissions of certain pollutants into the air from large combustion plants

Adapted by Ministerial Council Decision 2013/05/MC-EnC of 24 October 2013 on the implementation of Directive 2001/80/EC of the European Parliament and of the Council of 23 October 2001 on the limitation of emissions of certain pollutants into the air from large combustion plants.<sup>1</sup>

*The adaptations made by Ministerial Council Decision 2013/05/MC-EnC are highlighted in **bold and blue**.*

Whereas:

(1) Council Directive 88/609/EEC of 24 November 1988 on the limitation of emissions of certain pollutants into the air from large combustion plants has contributed to the reduction and control of atmospheric emissions from large combustion plants. It should be recast in the interests of clarity.

(2) The Fifth Environmental Action Programme sets as objectives that the critical loads and levels of certain acidifying pollutants such as sulphur dioxide (SO<sub>2</sub>) and nitrogen oxides (NO<sub>x</sub>) should not be exceeded at any time and, as regards air quality, that all people should be effectively protected against recognised health risks from air pollution.

(3) All Member States have signed the Gothenburg Protocol of 1 December 1999 to the 1979 Convention of the United Nations Economic Commission for Europe (UNECE) on long-range transboundary air pollution to abate acidification, eutrophication and ground-level ozone, which includes, *inter alia*, commitments to reduce emissions of sulphur dioxide and oxides of nitrogen.

(4) The Commission has published a Communication on a Community strategy to combat acidification in which the revision of Directive 88/609/EEC was identified as being an integral component of that strategy with the long term aim of reducing emissions of sulphur dioxide and nitrogen oxides sufficiently to bring depositions and concentrations down to levels below the critical loads and levels.

(5) In accordance with the principle of subsidiarity as set out in Article 5 of the Treaty, the objective of reducing acidifying emissions from large combustion plants cannot be sufficiently achieved by the Member States acting individually and uncoordinated action offers no guarantee of achieving the desired objective; in view of the need to reduce acidifying emissions across the Community, it is more effective to take action at Community level.

(6) Existing large combustion plants are significant contributors to emissions of sulphur dioxide and nitrogen oxides in the Community and it is necessary to reduce these emissions. It is therefore necessary to adapt the approach to the different characteristics of the large combustion plant sector in the Member States.

(7) Council Directive 96/61/EC of 24 September 1996 concerning integrated pollution prevention and control sets out an integrated approach to pollution prevention and control in which all the aspects of an installation's environmental performance are considered in an integrated manner; combustion installations with a rated thermal input exceeding 50 MW are included within the scope of that Directive; pursuant to Article 15(3) of that Directive an inventory of the principal emissions

<sup>1</sup> Ministerial Council Decision 2013/05/MC-EnC was subsequently amended by Ministerial Council Decision 2015/07/MC-EnC on amending Decision D/2013/05/MC-EnC of 24 October 2013 on the implementation of Directive 2001/80/EC of the European Parliament and of the Council on the limitation of emissions of certain pollutants into the air from large combustion plants and on amending Annex II of the Energy Community Treaty.

and sources responsible is to be published every three years by the Commission on the basis of data supplied by the Member States. Pursuant to Article 18 of that Directive, acting on a proposal from the Commission, the Council will set emission limit values in accordance with the procedures laid down in the Treaty for which the need for Community action has been identified, on the basis, in particular, of the exchange of information provided for in Article 16 of that Directive.

(8) Compliance with the emission limit values laid down by this Directive should be regarded as a necessary but not sufficient condition for compliance with the requirements of Directive 96/61/EC regarding the use of best available techniques. Such compliance may involve more stringent emission limit values, emission limit values for other substances and other media, and other appropriate conditions.

(9) Industrial experience in the implementation of techniques for the reduction of polluting emissions from large combustion plants has been acquired over a period of 15 years.

(10) The Protocol on heavy metals to the UNECE Convention on long-range transboundary air pollution recommends the adoption of measures to reduce heavy metals emitted by certain installations. It is known that benefits from reducing dust emissions by dust abatement equipment will provide benefits on reducing particle-bound heavy metal emissions.

(11) Installations for the production of electricity represent an important part of the large combustion plant sector.

(12) Directive 96/92/EC of the European Parliament and of the Council of 19 December 1996 concerning common rules for the internal market in electricity is intended *inter alia* to have the effect of distributing new production capacity among new arrivals in the sector.

(13) The Community is committed to a reduction of carbon dioxide emissions. Where it is feasible the combined production of heat and electricity represents a valuable opportunity for significantly improving overall efficiency in fuel use.

(14) A significant increase in the use of natural gas for producing electricity is already underway and is likely to continue, in particular through the use of gas turbines.

(15) In view of the increase in energy production from biomass, specific emission standards for this fuel are justified.

(16) The Council Resolution of 24 February 1997 on a Community strategy for waste management emphasises the need for promoting waste recovery and states that appropriate emission standards should apply to the operation of facilities in which waste is incinerated in order to ensure a high level of protection for the environment.

(17) Industrial experience has been gained concerning techniques and equipment for the measurement of the principal pollutants emitted by large combustion plants; the European Committee for Standardisation (CEN) has undertaken work with the aim of providing a framework securing comparable measurement results within the Community and guaranteeing a high level of quality of such measurements.

(18) There is a need to improve knowledge concerning the emission of the principal pollutants from large combustion plants. In order to be genuinely representative of the level of pollution of an installation, such information should also be associated with knowledge concerning its energy consumption.

(19) This Directive is without prejudice to the time limits within which the Member States must trans-

pose and implement Directive 88/609/EEC.

### **Article 1**

This Directive shall apply to combustion plants, the rated thermal input of which is equal to or greater than 50 MW, irrespective of the type of fuel used (solid, liquid or gaseous).

### **Article 2**

For the purpose of this Directive:

1. "emission" means the discharge of substances from the combustion plant into the air;
2. "waste gases" means gaseous discharges containing solid, liquid or gaseous emissions; their volumetric flow rates shall be expressed in cubic metres per hour at standard temperature (273 K) and pressure (101,3 kPa) after correction for the water vapour content, hereinafter referred to as (Nm<sup>3</sup>/h);
3. "emission limit value" means the permissible quantity of a substance contained in the waste gases from the combustion plant which may be discharged into the air during a given period; it shall be calculated in terms of mass per volume of the waste gases expressed in mg/Nm<sup>3</sup>, assuming an oxygen content by volume in the waste gas of 3% in the case of liquid and gaseous fuels, 6% in the case of solid fuels and 15% in the case of gas turbines;
4. "rate of desulphurisation" means the ratio of the quantity of sulphur which is not emitted into the air at the combustion plant site over a given period to the quantity of sulphur contained in the fuel which is introduced into the combustion plant facilities and which is used over the same period;
5. "operator" means any natural or legal person who operates the combustion plant, or who has or has been delegated decisive economic power over it;
6. "fuel" means any solid, liquid or gaseous combustible material used to fire the combustion plant with the exception of waste covered by Council Directive 89/369/EEC of 8 June 1989 on the prevention of air pollution from new municipal waste incineration plants, Council Directive 89/429/EEC of 21 June 1989 on the reduction of air pollution from existing municipal waste incineration plants, and Council Directive 94/67/EC of 16 December 1994 concerning the incineration of hazardous waste or any subsequent Community act repealing and replacing one or more of these Directives;
7. "combustion plant" means any technical apparatus in which fuels are oxidised in order to use the heat thus generated.

This Directive shall apply only to combustion plants designed for production of energy with the exception of those which make direct use of the products of combustion in manufacturing processes. In particular, this Directive shall not apply to the following combustion plants:

- (a) plants in which the products of combustion are used for the direct heating, drying, or any other treatment of objects or materials e.g. reheating furnaces, furnaces for heat treatment;
- (b) post-combustion plants i.e. any technical apparatus designed to purify the waste gases by combustion which is not operated as an independent combustion plant;

- (c) facilities for the regeneration of catalytic cracking catalysts;
- (d) facilities for the conversion of hydrogen sulphide into sulphur;
- (e) reactors used in the chemical industry;
- (f) coke battery furnaces;
- (g) cowpers;
- (h) any technical apparatus used in the propulsion of a vehicle, ship or aircraft;
- (i) gas turbines used on offshore platforms;
- (j) gas turbines licensed before 27 November 2002 or which in the view of the competent authority are the subject of a full request for a licence before 27 November 2002 provided that the plant is put into operation no later than 27 November 2003 without prejudice to Article 7(1) and Annex VIII(A) and (B);

Plants powered by diesel, petrol and gas engines shall not be covered by this Directive.

Where two or more separate new plants are installed in such a way that, taking technical and economic factors into account, their waste gases could, in the judgement of the competent authorities, be discharged through a common stack, the combination formed by such plants shall be regarded as a single unit;

8. "multi-fuel firing unit" means any combustion plant which may be fired simultaneously or alternately by two or more types of fuel;

9. "new plant" means any combustion plant for which the original construction licence or, in the absence of such a procedure, the original operating licence was granted on or after **1 July 1992**;

10. "existing plant" means any combustion plant for which the original construction licence or, in the absence of such a procedure, the original operating licence was granted before **1 July 1992**;

11. "biomass" means products consisting of any whole or part of a vegetable matter from agriculture or forestry which can be used as a fuel for the purpose of recovering its energy content and the following waste used as a fuel:

- (a) vegetable waste from agriculture and forestry;
  - (b) vegetable waste from the food processing industry, if the heat generated is recovered;
  - (c) fibrous vegetable waste from virgin pulp production and from production of paper from pulp, if it is co-incinerated at the place of production and the heat generated is recovered;
  - (d) cork waste;
  - (e) wood waste with the exception of wood waste which may contain halogenated organic compounds or heavy metals as a result of treatment with wood preservatives or coating, and which includes in particular such wood waste originating from construction and demolition waste;
12. "gas turbine" means any rotating machine which converts thermal energy into mechanical work, consisting mainly of a compressor, a thermal device in which fuel is oxidised in order to heat the working fluid, and a turbine.
13. "Outermost Regions" means the French Overseas Departments with regard to France, the Azores and Madeira with regard to Portugal and the Canary Islands with regard to Spain.

### Article 3

1. Not later than 1 July 1990 **Contracting Parties** shall draw up appropriate programmes for the progressive reduction of total annual emissions from existing plants. The programmes shall set out the timetables and the implementing procedures.
2. In accordance with the programmes mentioned in paragraph 1, **Contracting Parties** shall continue to comply with the emission ceilings and with the corresponding percentage reductions laid down for sulphur dioxide in Annex I, columns 1 to 6, and for oxides of nitrogen in Annex II, columns 1 to 4, by the dates specified in those Annexes, until the implementation of the provisions of Article 4 that apply to existing plants.
3. When the programmes are being carried out, **Contracting Parties** shall also determine the total annual emissions in accordance with Annex VIII(C).
4. If a substantial and unexpected change in energy demand or in the availability of certain fuels or certain generating installations creates serious technical difficulties for the implementation by a **Contracting Party** of its programme drawn up under paragraph 1, the **Secretariat** shall, at the request of the **Contracting Party** concerned and taking into account the terms of the request, take a decision to modify, for that **Contracting Party**, the emission ceilings and/or the dates set out in Annexes I and II and communicate its decision to the Council and to the **Contracting Parties**. Any **Contracting Party** may within three months refer the decision of the **Secretariat** to the Council. The Council, acting by a qualified majority, may within three months take a different decision.

### Article 4

1. Without prejudice to Article 17 **Contracting Parties** shall take appropriate measures to ensure that all licences for the construction or, in the absence of such a procedure, for the operation of new plants which in the view of the competent authority are the subject of a full request for a licence before 27 November 2002, provided that the plant is put into operation no later than 27 November 2003 contain conditions relating to compliance with the emission limit values laid down in part A of Annexes III to VII in respect of sulphur dioxide, nitrogen oxides and dust.
2. **Contracting Parties** shall take appropriate measures to ensure that all licences for the construction or, in the absence of such a procedure, for the operation of new plants, other than those covered by paragraph 1, contain conditions relating to compliance with the emission limit values laid down in part B of Annexes III to VII in respect of sulphur dioxide, nitrogen oxides and dust.
3. Without prejudice to Directive 96/61/EC and Council Directive 96/62/EC of 27 September 1996 on ambient air quality assessment and management, **Contracting Parties** shall, by **1 January 2018** at the latest, achieve significant emission reductions by:
  - (a) taking appropriate measures to ensure that all licences for the operation of existing plants contain conditions relating to compliance with the emission limit values established for new plants referred to in paragraph 1; or
  - (b) ensuring that existing plants are subject to the national emission reduction plan referred to in paragraph 6; and, where appropriate, applying Articles 5, 7 and 8.
4. **With the exception of plants for which a date of closure prior to 1 January 2018 has**

been agreed by the authorities via bilateral agreements with the European Union or other international organisations, existing plants may be exempted from compliance with the emission limit values referred to in paragraph 3 and from their inclusion in the national emission reduction plan on the following conditions:

(a) the operator of an existing plant undertakes, in a written declaration submitted by 31 December 2015 at the latest to the competent authority, not to operate the plant for more than 20 000 operational hours starting from 1 January 2018 and ending no later than 31 December 2023;

(b) the Ministerial Council, in the form of a decision and following a verification by the Secretariat that the above conditions are met, authorizes this exemption in the form of a decision approved by the majority of its members including a vote in favour by the European Union.

The operator is required to submit each year to the competent authority a record of the used and unused time allowed for the plants' remaining operational life. Contracting Parties are required to submit each year a summary of these reports to the Secretariat.

From the point in time when the plant has been operating for 20 000 hours since 1 January 2018 and in any case from 1 January 2024 onwards, the plant shall not be operated further unless it meets the emission limit values set out in Part 2 of Annex V to Directive 2010/75/EU.<sup>2</sup>

5. **Contracting Parties** may require compliance with emission limit values and time limits for implementation which are more stringent than those set out in paragraphs 1, 2, 3 and 4 and in Article 10. They may include other pollutants, and they may impose additional requirements or adaptation of plant to technical progress.

6. **Contracting Parties** may, without prejudice to this Directive and Directive 96/61/EC, and taking into consideration the costs and benefits as well as their obligations under Directive 2001/81/EC of the European Parliament and of the Council of 23 October 2001 on national emission ceilings for certain atmospheric pollutants and Directive 96/62/EC, define and implement a national emission reduction plan for existing plants, taking into account, *inter alia*, compliance with the ceilings as set out in Annexes I and II.

The national emission reduction plan shall reduce the total annual emissions of nitrogen oxides (NO<sub>x</sub>), sulphur dioxide (SO<sub>2</sub>) and dust from existing plants to the levels that would have been achieved by applying the emission limit values referred to in paragraph 3 to the existing plants in operation in the year **2012**, (including those existing plants undergoing a rehabilitation plan in **2012**, approved by the competent authority, to meet emission reductions required by national legislation) on the basis of each plant's actual annual operating time, fuel used and thermal input, averaged over the last five years of operation up to and including **2012**.

The closure of a plant included in the national emission reduction plan shall not result in an increase in the total annual emissions from the remaining plants covered by the plan.

The national emission reduction plan may under no circumstances exempt a plant from the provisions laid down in relevant Community legislation, including *inter alia* Directive 96/61/EC.

The following conditions shall apply to national emission reduction plans:

<sup>2</sup> The text displayed here corresponds to Article 4 of Decision 2013/05/MC-EnC.

- (a) the plan shall comprise objectives and related targets, measures and timetables for reaching these objectives and targets, and a monitoring mechanism;
- (b) **Contracting Parties** shall communicate their national emission reduction plan to the **Secretariat** no later than **31 December 2015**;
- (c) within **nine** months of the communication referred to in point (b) the **Secretariat** shall evaluate whether or not the plan meets the requirements of this paragraph. When the **Secretariat** considers that this is not the case, it shall inform the **Contracting Party** and within the subsequent three months the **Contracting Party** shall communicate any measures it has taken in order to ensure that the requirements of this paragraph are met;
- (d) the **Secretariat** shall, no later than 27 November 2002, develop guidelines to assist **Contracting Parties** in the preparation of their plans.

**National emission reduction plans shall be in use up to 31 December 2027 at the latest.**

**The ceilings for the year 2018 shall be calculated on the basis of the applicable emission limit values at the time of submission of the plan as set out in Part A to Annexes III to VII to Directive 2001/80/EC or, where applicable, on the basis of the rates of desulphurisation set out in Annex III to Directive 2001/80/EC. In the case of gas turbines, the emission limit values for nitrogen oxides set out for such plants in Part B of Annex VI to Directive 2001/80/EC shall be used.**

**The ceilings for the year 2023 shall be calculated on the basis of the applicable emission limit values in that year set out in Part A to Annexes III to VII to Directive 2001/80/EC or, where applicable, on the basis of the rates of desulphurisation set out in Annex III to Directive 2001/80/EC. In the case of gas turbines, the emission limit values for nitrogen oxides set out for such plants in Part B of Annex VI to Directive 2001/80/EC shall be used. The ceilings for the years 2019 to 2022 shall be set providing a linear trend between the ceilings of 2018 and 2023.**

**The ceilings for the year 2026 and 2027 shall be calculated on the basis of the relevant emission limit values set out in Part 1 of Annex V to Directive 2010/75/EU or, where applicable, the relevant rates of desulphurisation set out in Part 5 of Annex V to Directive 2010/75/EU. The ceilings for the years 2024 and 2025 shall be set providing a linear decrease of the ceilings between 2023 and 2026.<sup>3</sup>**

7. Not later than 31 December 2004 and in the light of progress towards protecting human health and attaining the Community's environmental objectives for acidification and for air quality pursuant to Directive 96/62/EC, the **Secretariat** shall submit a report to the European Parliament and the Council in which it shall assess:

- (a) the need for further measures;

<sup>3</sup> The text displayed here corresponds to Article 5(4) of Decision 2013/05/MC-EnC. According to Article 2 of Decision 2015/07/MC-EnC, "As regards Ukraine, <...> [a] national emission reduction plan shall be in use up to 31 December 2028 at the latest for SO<sub>2</sub> and dust and up to 31 December 2033 for NO<sub>x</sub>.

The ceilings for the 2018 shall not be higher than the emissions for the year 2012 from the plants concerned, while taking into account all emission reduction measures that are foreseen to be realised by 2018.

The ceilings for the year 2028 for SO<sub>2</sub> and dust and the ceiling for the year 2033 for NO<sub>x</sub> shall be calculated on the basis of the relevant emission limit values set out in Part 1 of Annex V to Directive 2010/75/EU or, where applicable, the relevant rates of desulphurisation set out in Part 5 of Annex V to Directive 2010/75/EU.

The ceilings for the intermediate years shall be set providing a linear decrease of the ceilings between 2018 on the one hand, and 2028 (for SO<sub>2</sub> and dust) or 2033 (for NO<sub>x</sub>) on the other."

- (b) the amounts of heavy metals emitted by large combustion plants;
- (c) the cost-effectiveness and costs and advantages of further emission reductions in the combustion plants sector in **Contracting Parties** compared to other sectors;
- (d) the technical and economic feasibility of such emission reductions;
- (e) the effects of both the standards set for the large combustion plants sector including the provisions for indigenous solid fuels, and the competition situation in the energy market, on the environment and the internal market;
- (f) any national emission reduction plans provided by **Contracting Parties** in accordance with paragraph 6.

The **Secretariat** shall include in its report an appropriate proposal of possible end dates or of lower limit values for the derogation contained in footnote 2 to Annex VI(A).

8. The report referred to in paragraph 7 shall, as appropriate, be accompanied by related proposals, having regard to Directive 96/61/EC.

### **Article 5**

By way of derogation from Annex III:

1. Plants, of a rated thermal input equal to or greater than 400 MW, which do not operate more than the following numbers of hours a year (rolling average over a period of five years),

- until 31 December 2015, 2000 hours;
- from 1 January 2016, 1500 hours;

shall be subject to a limit value for sulphur dioxide emissions of 800 mg/Nm<sup>3</sup>.

This provision shall not apply to new plants for which the licence is granted pursuant to Article 4(2).

2. Until 31 December 1999, the Kingdom of Spain may authorise new power plants with a rated thermal input equal to or greater than 500 MW burning indigenous or imported solid fuels, commissioned before the end of 2005 and complying with the following requirements:

- (a) in the case of imported solid fuels, a sulphur dioxide emission limit value of 800 mg/Nm<sup>3</sup>;
- (b) in the case of indigenous solid fuels, at least a 60% rate of desulphurisation,

provided that the total authorised capacity of such plants to which this derogation applies does not exceed:

- 2000 MWe in the case of plants burning indigenous solid fuels;
- in the case of plants burning imported solid fuels either 7500 or 50% of all the new capacity of all plants burning solid fuels authorised up to 31 December 1999, whichever is the lower.

### **Article 6**

In the case of new plants for which the licence is granted pursuant to Article 4(2) or plants covered by Article 10, **Contracting Parties** shall ensure that the technical and economic feasibility of providing for the combined generation of heat and power is examined. Where this feasibility is confirmed,

bearing in mind the market and the distribution situation, installations shall be developed accordingly.

### **Article 7**

1. **Contracting Parties** shall ensure that provision is made in the licences or permits referred to in Article 4 for procedures relating to malfunction or breakdown of the abatement equipment. In case of a breakdown the competent authority shall in particular require the operator to reduce or close down operations if a return to normal operation is not achieved within 24 hours, or to operate the plant using low polluting fuels. In any case the competent authority shall be notified within 48 hours. In no circumstances shall the cumulative duration of unabated operation in any twelve-month period exceed 120 hours. The competent authority may allow exceptions to the limits of 24 hours and 120 hours above in cases where, in their judgement:

- (a) there is an overriding need to maintain energy supplies, or
- (b) the plant with the breakdown would be replaced for a limited period by another plant which would cause an overall increase in emissions.

2. The competent authority may allow a suspension for a maximum of six months from the obligation to comply with the emission limit values provided for in Article 4 for sulphur dioxide in respect of a plant which to this end normally uses low-sulphur fuel, in cases where the operator is unable to comply with these limit values because of an interruption in the supply of low-sulphur fuel resulting from a serious shortage. The **Secretariat** shall immediately be informed of such cases.

3. The competent authority may allow a derogation from the obligation to comply with the emission limit values provided for in Article 4 in cases where a plant which normally uses only gaseous fuel, and which would otherwise need to be equipped with a waste gas purification facility, has to resort exceptionally, and for a period not exceeding 10 days except where there is an overriding need to maintain energy supplies, to the use of other fuels because of a sudden interruption in the supply of gas. The competent authority shall immediately be informed of each specific case as it arises. **Contracting Parties** shall inform the **Secretariat** immediately of the cases referred to in this paragraph.

### **Article 8**

1. In the case of plants with a multi-firing unit involving the simultaneous use of two or more fuels, when granting the licence referred to in Articles 4(1) or 4(2), and in the case of such plants covered by Articles 4(3) or 10, the competent authority shall set the emission limit values as follows:

- (a) firstly by taking the emission limit value relevant for each individual fuel and pollutant corresponding to the rated thermal input of the combustion plant as given in Annexes III to VII,
- (b) secondly by determining fuel-weighted emission limit values, which are obtained by multiplying the above individual emission limit value by the thermal input delivered by each fuel, the product of multiplication being divided by the sum of the thermal inputs delivered by all fuels,
- (c) thirdly by aggregating the fuel-weighted limit values.

2. In multi-firing units using the distillation and conversion residues from crude-oil refining for own

consumption, alone or with other fuels, the provisions for the fuel with the highest emission limit value (determinative fuel) shall apply, notwithstanding paragraph 1 above, if during the operation of the combustion plant the proportion contributed by that fuel to the sum of the thermal inputs delivered by all fuels is at least 50%.

Where the proportion of the determinative fuel is lower than 50%, the emission limit value is determined on a pro rata basis of the heat input supplied by the individual fuels in relation to the sum of the thermal inputs delivered by all fuels as follows:

- (a) firstly by taking the emission limit value relevant for each individual fuel and pollutant corresponding to the rated heat input of the combustion plant as given in Annexes III to VII,
- (b) secondly by calculating the emission limit value of the determinative fuel (fuel with the highest emission limit value according to Annexes III to VII and, in the case of two fuels having the same emission limit value, the fuel with the higher thermal input); this value is obtained by multiplying the emission limit value laid down in Annexes III to VII for that fuel by a factor of two, and subtracting from this product the emission limit value of the fuel with the lowest emission limit value,
- (c) thirdly by determining the fuel-weighted emission limit values, which are obtained by multiplying the calculated fuel emission limit value by the thermal input of the determinative fuel and the other individual emission limit values by the thermal input delivered by each fuel, the product of multiplication being divided by the sum of the thermal inputs delivered by all fuels,
- (d) fourthly by aggregating the fuel-weighted emission limit values.

3. As an alternative to paragraph 2, the following average emission limit values for sulphur dioxide may be applied (irrespective of the fuel combination used):

- (a) for plants referred to in Article 4(1) and (3): 1000 mg/Nm<sup>3</sup>, averaged over all such plants within the refinery;
- (b) for new plants referred to in Article 4(2): 600 mg/Nm<sup>3</sup>, averaged over all such plants within the refinery, with the exception of gas turbines.

The competent authorities shall ensure that the application of this provision does not lead to an increase in emissions from existing plants.

4. In the case of plants with a multi-firing unit involving the alternative use of two or more fuels, when granting the licence referred to in Article 4(1) and (2), and in the case of such plants covered by Articles 4(3) or 10, the emission limit values set out in Annexes III to VII corresponding to each fuel used shall be applied.

### **Article 9**

Waste gases from combustion plants shall be discharged in controlled fashion by means of a stack. The licence referred to in Article 4 and licences for combustion plants covered by Article 10 shall lay down the discharge conditions. The competent authority shall in particular ensure that the stack height is calculated in such a way as to safeguard health and the environment.

**Article 10**

Where a combustion plant is extended by at least 50 MW, the emission limit values as set in part B of Annexes III to VII shall apply to the new part of the plant and shall be fixed in relation to the thermal capacity of the entire plant. This provision shall not apply in the cases referred to in Article 8(2) and (3).

Where the operator of a combustion plant is envisaging a change according to Articles 2(10)(b) and 12(2) of Directive 96/61/EC, the emission limit values as set out in part B of Annexes III to VII in respect of sulphur dioxide, nitrogen oxides and dust shall apply.

**Article 11**

In the case of construction of combustion plants which are likely to have significant effects on the environment in another **Contracting Party**, the **Contracting Parties** shall ensure that all appropriate information and consultation takes place, in accordance with Article 7 of Council Directive 85/337/EEC of 27 June 1985 on the assessment of the effects of certain public and private projects on the environment.

**Article 12**

**Contracting Parties** shall take the necessary measures to ensure the monitoring, in accordance with Annex VIII(A), of emissions from the combustion plants covered by this Directive and of all other values required for the implementation of this Directive. **Contracting Parties** may require that such monitoring shall be carried out at the operator's expense.

**Article 13**

**Contracting Parties** shall take appropriate measures to ensure that the operator informs the competent authorities within reasonable time limits about the results of the continuous measurements, the checking of the measuring equipment, the individual measurements and all other measurements carried out in order to assess compliance with this Directive.

**Article 14**

1. In the event of continuous measurements, the emission limit values set out in part A of Annexes III to VII shall be regarded as having been complied with if the evaluation of the results indicates, for operating hours within a calendar year, that:

(a) none of the calendar monthly mean values exceeds the emission limit values; and

(b) in the case of:

(i) sulphur dioxide and dust: 97% of all the 48 hourly mean values do not exceed 110% of the

emission limit values,

(ii) nitrogen oxides: 95% of all the 48 hourly mean values do not exceed 110% of the emission limit values.

The periods referred to in Article 7 as well as start-up and shut-down periods shall be disregarded.

2. In cases where only discontinuous measurements or other appropriate procedures for determination are required, the emission limit values set out in Annexes III to VII shall be regarded as having been complied with if the results of each of the series of measurements or of the other procedures defined and determined according to the rules laid down by the competent authorities do not exceed the emission limit values.

3. In the cases referred to in Article 5(2) and (3), the rates of desulphurisation shall be regarded as having been complied with if the evaluation of measurements carried out pursuant to Annex VIII, point A.3, indicates that all of the calendar monthly mean values or all of the rolling monthly mean values achieve the required desulphurisation rates.

The periods referred to in Article 7 as well as start-up and shut-down periods shall be disregarded.

4. For new plants for which the licence is granted pursuant to Article 4(2), the emission limit values shall be regarded, for operating hours within a calendar year, as complied with if:

(a) no validated daily average value exceeds the relevant figures set out in part B of Annexes III to VII, and

(b) 95% of all the validated hourly average values over the year do not exceed 200% of the relevant figures set out in part B of Annexes III to VII.

The "validated average values" are determined as set out in point A.6 of Annex VIII.

The periods referred to in Article 7 as well as start up and shut down periods shall be disregarded.

### Article 15

1. **Contracting Parties** shall, not later than 31 December 1990, inform the **Secretariat** of the programmes drawn up in accordance with Article 3(1).

At the latest one year after the end of the different phases for reduction of emissions from existing plants, the **Contracting Parties** shall forward to the **Secretariat** a summary report on the results of the implementation of the programmes.

An intermediate report is required as well in the middle of each phase.

2. The reports referred to in paragraph 1 shall provide an overall view of:

(a) all the combustion plants covered by this Directive,

(b) emissions of sulphur dioxide, and oxides of nitrogen expressed in tonnes per annum and as concentrations of these substances in the waste gases,

(c) measures already taken or envisaged with a view to reducing emissions, and of changes in the choice of fuel used,

(d) changes in the method of operation already made or envisaged,

(e) definitive closures of combustion plants already effected or envisaged, and

(f) where appropriate, the emission limit values imposed in the programmes in respect of existing plants.

When determining the annual emissions and concentrations of pollutants in the waste gases, **Contracting Parties** shall take account of Articles 12, 13 and 14.

3. **Contracting Parties** applying Article 5 or the provisions of the Nota Bene in Annex III or the footnotes in Annex VI(A) shall report thereon annually to the **Secretariat**.

### **Article 16**

The **Contracting Parties** shall determine the penalties applicable to breaches of the national provisions adopted pursuant to this Directive. The penalties thus provided for shall be effective, proportionate and dissuasive.

### **Article 17**

1. Directive 88/609/EEC shall be repealed with effect from 27 November 2002, without prejudice to paragraph 2 or to the obligations of **Contracting Parties** concerning the time limits for transposition and application of that Directive listed in Annex IX hereto.

2. In the case of new plants licensed before 27 November 2002 Article 4(1) of this Directive, Article 4(1), Article 5(2), Article 6, Article 15(3), Annexes III, VI, VIII and point A.2 of Annex IX to Directive 88/609/EEC as amended by Directive 94/66/EC shall remain in effect until 1 January 2008 after which they shall be repealed.

3. References to Directive 88/609/EEC shall be construed as references to this Directive and shall be read in accordance with the correlation table in Annex X hereto.

### **Article 18**

1. **Contracting Parties** shall bring into force the laws, regulations and administrative provisions necessary to comply with this Directive before 31 December 2017.<sup>4,5</sup> They shall forthwith inform the **Secretariat** thereof.

When **Contracting Parties** adopt these provisions, they shall contain a reference to this Directive or shall be accompanied by such reference on the occasion of their official publication. The methods of making such reference shall be laid down by **Contracting Parties**.

2. For existing plant, and for new plant for which a licence is granted pursuant to Article 4(1), the provisions of point A.2 of Annex VIII shall be applied from 27 November 2004.

3. **Contracting Parties** shall communicate to the **Secretariat** the texts of the provisions of national law which they adopt in the field covered by this Directive.

<sup>4</sup> The text displayed here corresponds to point 3 of Annex II of the Energy Community Treaty.

<sup>5</sup> In accordance with the Accession Protocol, the corresponding date for Georgia is 31 December 2018.

**Article 19**

**This Decision shall enter into force upon its adoption by the Ministerial Council.**<sup>6</sup>

**Article 20**

This Directive is addressed to the **Contracting Parties**.
